What Is Psychological Warfare

Psychological warfare uses propaganda, psychological deception, and other means to influence the opinions, emotions, and behavior of enemy combatants or civilians. Psychological warfare aims to demoralize the enemy, reduce their will to fight, and make them more likely to surrender or defect.

Psychological warfare can be used in a variety of ways, including:

Propaganda: This is the use of information designed to promote a particular point of view or influence how people think or act. Propaganda can be used to spread false information, to create fear or hatred, or to promote a particular course of action.

Psychological Deception: This is the use of false information or misleading statements to deceive the enemy. This can be done through propaganda, through the use of double agents, or other means.

Emotional Manipulation: This is the use of psychological techniques to influence the enemy's emotions. This can be done through propaganda, torture, other forms of abuse, or other means.

Behavioral Manipulation: This is the use of psychological techniques to influence the enemy's behavior. This can be done through propaganda, through the use of economic sanctions, or other means.

The history of psychological warfare is long and complex, dating back to the ancient world. Some of the earliest examples of psychological warfare can be found in the writings of Sun Tzu, the Chinese military strategist who lived in the 5th century BC. In his book *The Art of War*, Sun Tzu wrote about demoralizing the enemy and using propaganda to sow discord and confusion.

Psychological warfare was also used extensively during the Middle Ages, as armies used propaganda to spread fear and uncertainty among their enemies. One of the most famous examples is the Black Death, which the Mongols spread in the 14th century. The Mongols spread rumors that the plague was divine punishment for their enemies' sins, which helped to demoralize the enemy and make them more likely to surrender.

Psychological warfare has become even more sophisticated and widespread in the modern era. During World War I, the Allies and the Central Powers used propaganda to influence public opinion and demoralize the enemy. One of the most famous examples is the Zimmermann Telegram, a secret message sent by Germany to Mexico in 1917. The telegram offered Mexico money and support if they would join the war on Germany's side. The telegram was intercepted by the British and leaked to the press, and it helped to turn American public opinion against Germany.

Psychological warfare has continued to be used in wars and conflicts throughout the 20th and 21st centuries. During the Cold War, both the United States and the Soviet Union used propaganda to try to undermine each other's governments and influence public opinion in their favor. In recent years, psychological warfare has been used in conflicts such as the Iraq War and the War in Afghanistan.

Today, psychological warfare is a significant part of modern warfare. It influences public opinion, demoralizes the enemy, and achieves strategic objectives.

Operational Planning

Operational planning is essential as it allows organizations to plan and execute desired missions.

Highlights of operational planning include:

Set And Achieve Goals: Operational plans provide a road map for achieving organizational goals. By setting specific, measurable, achievable, relevant, and time-bound objectives, operational plans can help organizations stay on track and progress toward their goals.

Use Resources Efficiently: Operational plans help organizations identify and allocate resources to maximize efficiency and minimize waste. By carefully considering the available resources and the tasks that need to be completed, operational plans can help organizations to get the most out of their resources.

Be Prepared For Change: Operational plans help organizations to anticipate and respond to change. By identifying potential risks and opportunities, operational plans can help organizations to develop strategies for dealing with change.

Improve Communication And Coordination: Operational plans help improve organizational communication and coordination. By clearly defining roles and responsibilities, operational plans help ensure everyone is working towards the same goals.

Make Better Decisions: Operational plans provide a framework for making better decisions. By considering the available information and resources, operational plans can help organizations make decisions that are more likely to be successful.

Make Sure The Goals Are Specific: What exactly is the intended result? The more specific the goal is, the easier it will be to progress towards it.

Make Sure The Goals Are Measurable: How will you know if the goal has been achieved? Having a way to measure the progress will help you stay on track and make adjustments as needed.

Make Sure The Goals Are Achievable: It is essential to make the goals achievable. Break the goals down into smaller, more manageable steps.

Make Sure The Goals Are Relevant: Are the goals aligned with the objectives and priorities?

Make Sure The Goals Are Time Bound: Set a deadline for achieving the desired goal.

Dividing the operational planning into smaller, more manageable steps is essential. This process allows the flow of the operation to be more efficiently executed and the progress of completion more readily tracked.

It is also necessary to be flexible and have the ability to adjust the goals as needed. Life exists as a series of changes, and operations are not different. Things do not always go according to plan, so it is essential to have the ability to adapt and change the goals if necessary or required.

A comprehensive objective for the Psychological Operation can be established once these factors have been considered.

Define The Objective

The first step in planning a Psychological Operation is to define the objective. What do you want to achieve with the operation? Do you want to demoralize the enemy? Promote disunity? Undermine the enemy's will to fight? Once you know your objective, you can develop a plan to achieve it.

The objective of a Psychological Operation is to influence the target audience's emotions, motives, objective reasoning, and, ultimately, behavior. The desired behavior can be to accept a point of view, take a specific action, or adopt a certain attitude.

WHO - WHAT - WHERE - WHEN - WHY

When defining the objective of a Psychological Operation, it is essential to consider the following factors:

The Target Audience: Who are you trying to influence?

The Desired Behavior: What do you want the target audience to do?

The Environment: What is the current situation in the target audience's environment?

The Resources Available: What resources do you have available to carry out the Psychological Operation?

A comprehensive objective for the Psychological Operation can be established once these factors have been considered.

The objective should be clear, measurable, achievable, relevant, and time-bound.

Here are some examples of specific objectives for Psychological Operations:

- Increase the target audience's trust in the government by 10% in the next month.
- Reduce the target audience's support for the insurgency by 5% in the next quarter.
- Encourage the target audience to evacuate a dangerous area within 24 hours.

Defining the objective of a Psychological Operation is an essential first step in the planning process. Establishing a clear objective expectation allows the mission participants to develop an operation that is more likely to achieve the desired results.

Identify The Target Audience

The next step is to identify the target audience. Who are you trying to influence with your psychological operation? Are you trying to reach the enemy's soldiers? The enemy's civilian population? The enemy's leadership? Once you have defined your target audience, you can start developing messages that appeal to them.

Identifying the target audience of a psychological operation is one of the most essential steps in the planning process. The target audience is the group of people that you are trying to influence with your psychological operation.

There are several factors to consider when identifying the target audience:

The Objective Of The Psychological Operation: The target audience will depend on the objective of the psychological operation. For example, if you are trying to demoralize the enemy, you will target the enemy's soldiers.

The Environment: The target audience will also depend on the environment where the psychological operation will occur. For example, if you are conducting a psychological operation in a foreign country, you will need to consider the culture and language of the target audience.

The Resources Available: The target audience will also depend on the available resources. For example, if you have limited resources, you may need to target a smaller group of people.

Once you have considered these factors, you can start to develop a profile of the target audience. The profile should include the following information:

Demographics: The demographic information of the target audience, such as age, gender, and location.

Psychographics: The psychographic information of the target audience, such as interests, attitudes, and beliefs.

Needs and wants: The needs and wants of the target audience.

Develop The Message

The third step is developing the messages you will use in your psychological operation. These messages should be tailored to your target audience and designed to achieve your objective. For example, if you are trying to demoralize the enemy, you might use messages highlighting the enemy's defeats or that make the enemy feel hopeless.

Here are some tips on how to develop a message for a psychological operation:

What Do You Want To Achieve: Indicate precisely the message's object. Define what actions should be taken.

Be Clear And Concise: The message should be easy to understand and remember.

Be Credible: The message should be believable and consistent with the target audience's values and beliefs.

Be Relevant: The message should be relevant to the target audience's needs and interests.

Be Timely: The message should be delivered when the target audience is receptive to it.

Be Consistent: The message should be consistent with other messages that the target audience has been exposed to.

Be Creative: The message should be original and attention-grabbing.

Be Measurable: The message should be designed to achieve a specific objective.

Here are some examples of messages that have been used in psychological operations:

"Freedom is contagious." The United States used this message during the Cold War to encourage people in communist countries to overthrow their governments.

"The enemy is weak and will soon be defeated." During World War II, the Allies used this message to boost morale and encourage people to keep fighting.

"We are here to help you." This message has been used by the United Nations and other humanitarian organizations to provide aid to people in need.

Create The Perfect Message

Create a storyboard for designing and creating the content presentation.

Define the order for the presentation of the content.

Present the information in an easy to understand and logical sequence.

Define which content segments (text, graphic, audio, video) which will be paired with other elements (phrases, music, background, lyrics).

Ensure that all content segments complement each other and not overshadow the other elements.

Examples Of This Include: Background music does not render voiceover audio unintelligible or background imagery does not detract attention from the primary visual focus.

Ensure that content transitions smoothly to ensure a quality presentation that does not jar or detract from the overall quality.

Ensure that all selected content is culturally and ethnically acceptable for the target audience.

Ensure all text, visual and audio content is grammatically correct for the target audience.

Emphasize these essential elements in the presentation:

- Topic background information.
- Specific facts and statistics.
- Why the audience should care.
- What action the audience can take.
- The impact of the issue on relevant communities.
- References to issues the audience can relate with.
- Emphasize the importance of spreading the word.
- Remember that message brevity and information quality are vital for achieving success.

Use compelling methods to engage your audience:

- Slogans.
- Imagery.
- Stories.
- Skilled media editing.

Psychological Warfare Campaign Information Worksheet

Accurate, timely, and comprehensive information will allow development and planning to assess the target audience comprehensively. This information can also be used to understand the relevant underlying issues and options for achieving success.

The content delivery method can be determined once the target audience has been identified and designated. The choice of content delivery method will directly affect the resource requirements for the creation of the content.

A matrix diagram of information can be created using the supplied information and can be used to assist in the planning of content creation and methods for content delivery. This method will allow proper resource and personnel allocation to achieve the maximum success rate of the planned operation.

Method Of Delivery

The fourth step is to choose the delivery method you will use to deliver your messages. Will you use radio? Television? Newspapers? Social media? The channels that you choose will depend on your target audience and on the resources that you have available.

The method of delivery for a Psychological Operation (PSYOP) should be chosen based on the following factors:

The Target Audience: The delivery method should be appropriate for the target audience. For example, if the target audience is young people, you might use social media or video games.

The Objective: The delivery method should be designed to achieve the objective of the Psychological Operation. For example, if the objective is to demoralize the enemy, you might use propaganda or deception.

The Environment: The delivery method should be appropriate for the environment where the Psychological Operation will occur. For example, if the Psychological Operation will take place in a war zone, you might use leaflets or loudspeakers.

Mission Resource Availability: The delivery method should be feasible with the available resources on hand. For example, it may be necessary to use leaflets or radio broadcasts if additional resources are not available.

Target Audience Resource Availability: The delivery method should be feasible with the available resources of the target audience. For example, does the target audience have unfiltered access to internet content, or does the target audience have equipment capable of receiving long distant radio or television broadcasts?

There are several different methods of delivering Psychological Operations, including:

Leaflets: Leaflets are a low-cost and effective way to deliver messages to a large audience. They can be dropped from airplanes or distributed by hand.

Radio Broadcasts: Radio broadcasts are an excellent way to reach a large audience, especially in rural areas. They can deliver messages, provide information, or create a sense of urgency.

Television Broadcasts: Television broadcasts are an excellent way to reach a large audience, especially in urban areas. They can deliver messages, provide information, or create a sense of urgency.

Internet: The Internet is an excellent way to reach a large audience, especially young people. It can deliver messages, provide information, or create a sense of urgency.

Social media: Social media is an excellent way to reach a large audience, especially young people. It can deliver messages, provide information, or create a sense of urgency.

Public events: Public events are an excellent way to reach a large audience in person. They can deliver messages, provide information, or create a sense of urgency.

Personnel: Personnel can deliver messages in person or over the phone. They can also be used to gather information about the target audience.

It is essential to choose the method of delivery that is most likely to achieve the required objectives successfully.

Implementation

The fifth step is to implement the operation. This process involves delivering the messages to the desired target audience using the specified methods. It also consists of monitoring the operational progress and adjusting as needed.

Immediately prior to the implementation phase, a thorough operational assessment review should be made to ensure that all required resources and personnel are in place and ready to deploy. This assessment will allow the mission to achieve the planned objectives. Key operational personnel should also be given an expected timeline for mission execution.

Reserve resources for the mission should be accounted for and prepared for the operational mission. Designated reserve personnel should also be included in the operational assessment review, briefed, and prepared for final mission execution. The reserve personnel should also be notified of an expected timeline for the imminent mission execution, depending on the complexity, scope, and operational mission requirements.

The operational implementation process should be thoroughly specified to alleviate any possibilities of deviating from the intended final results. All operational participants should review the operational plan prior to execution. This review will allow all participants to understand all necessary elements, process steps, and resource requirements and ensure clarity and interpretation of the intended results. All involved organizations should also have their specific roles defined to ensure the proper execution of all plan elements.

All information related to all individual campaign research, planning, operational implementation, post-operational review, and message reach assessments should be combined and cataloged for later peer review/lessons learned assessments. Such information can also be a valuable resource for future operational campaign research and implementation.

Evaluate The Results

The sixth and final step is to evaluate the results of the operation. Did you achieve your objective? If not, why not? What can you learn from this experience for future psychological operations?

There are several different ways to evaluate a Psychological Operation (PSYOP). One common approach is to use a mix of quantitative and qualitative methods. Quantitative methods can measure the reach and impact of the Psychological Operation, while qualitative methods can be used to understand the target audience's reaction to the Psychological Operation.

Some common quantitative methods used to evaluate Psychological Operations include:

Surveys: Surveys can measure the target audience's awareness of the Psychological Operation, their understanding of the message, and their attitude toward it.

Focus Groups: Focus groups can be used to understand better the target audience's reaction to the Psychological Operation. Focus groups can be used to identify the key messages that resonated with the target audience, as well as the key messages that were not effective.

Content Analysis: Content analysis can be used to analyze the media coverage of the Psychological Operation. Content analysis can be used to identify the key themes covered in the media and the tone of the coverage.

Some common qualitative methods used to evaluate Psychological Operations include:

Interviews: Interviews can be used to understand better the target audience's reaction to the Psychological Operation. Interviews can be used to identify the key messages that resonated with the target audience, as well as the key messages that were not effective.

Observation: Observation can be used to observe the target audience's behavior in response to the Psychological Operation. These can be used to identify the critical behavioral changes caused by the Psychological Operation.

Case Studies: Case studies can be used to study the impact of the Psychological Operation on a specific group of people or a specific event. Case studies can be used to identify the key factors that contributed to the success or failure of the Psychological Operation.

The specific methods used to evaluate a Psychological Operation will depend on the specific objectives of the Psychological Operation, the target audience, and the resources available.

Psychological Warfare Campaign Content Review

How well do you remember this message? **(Check only one.)**

- ☐ Don't remember at all
- ☐ Remember intended audience but not the cause of the problem or way to fix problem.
- ☐ Remember intended audience and cause of the problem but not way to fix problem.
- ☐ Remember everything.

If you were describing this message to a friend, would you say this message is? **(Check all that apply.)**

General Methods To Enhance The Effectiveness Of Campaigns

Targeting: The target audience must be carefully selected and understood. Messages must be tailored to the target audience's needs, interests, and values.

Credibility: The final product must be credible and believable. This can be achieved through credible sources, such as experts or celebrities.

Consistency: The delivery must be consistent over time. This means that the messages must be repeated and reinforced.

Relevance: The final product must be relevant to the target audience's needs and interests. The messages must address the target audience's concerns and offer solutions.

Timing: The delivery must be timed correctly. The messages must be delivered when the target audience is most likely receptive to them.

Flexibility: The final content creation must be flexible enough to adapt to changing circumstances. The messages must be able to be adjusted as needed.

Evaluation: The final content must be evaluated to determine its effectiveness. This will help to identify areas where it can be improved.

Testing: The final content should be with a small group of people to get their feedback. This will help you identify any areas needing improvement before distributing the content.

Clear And Concise: Get the point across quickly and concisely. People have short attention spans. Use simple language and avoid jargon or technical terms.

Make The Message Persuasive: The message should be compelling. You want to convince the audience to take action.

Make It Relevant: Your final product should be relevant to the people you are trying to reach.

Make It Emotional: People are more likely to remember and act on messages that evoke an emotional response. Use powerful images and stories to connect with your audience on a personal level.

Make It Memorable: Your final product should be memorable so that people will think about it long after they have experienced it. Use catchy slogans, music, or visuals to help the message stick in the people's minds.

Make It Actionable: Tell people what you want them to do after they experience your message. Make sure your call to action is clear and easy to understand.

Make It Shareable: The final content should be shareable so that people can help spread the message. Use social media, email, and other channels to encourage people to share the message with their friends and family.

Make It Trackable: You should track the results of your message so you can see how well it is performing. This will help you identify what is working and what is not so that you can make necessary adjustments.

Specific Methods To Enhance The Effectiveness Of A **PRINT** Campaigns

Use High Quality Images: Images are one of the most critical elements of print. Make sure your images are high-quality and relevant to your message.

Use A Strong Headline: The headline is the first thing people will see, so make sure it is attention-grabbing and relevant to the message.

Use White Space Effectively: White space is the empty space around text and images. It can make the printed material look more visually appealing and draw attention to your message.

Specific Methods To Enhance The Effectiveness Of **VIDEO** Campaigns

Keep It Short And Sweet: People have short attention spans, so getting the message across quickly and concisely is essential. Aim for content that is 30 seconds or less.

Use A Catchy Hook: The first few seconds of the video are crucial for grabbing someone's attention. Use a strong hook that will entice people to want to watch more.

Professional Video Production: A well produced video will look more polished and professional, which will make people more likely to take your message seriously.

Use Eye Catching Visuals: People are more likely to watch a video with interesting and attention-grabbing visuals. Use high-quality images and videos that will capture people's attention.

Tell A Story: People are more likely to remember and connect with a video if it tells a story. Use your video to tell a story about the cause or concern that will resonate with the target audience.

Specific Methods To Enhance The Effectiveness Of **AUDIO** Campaigns

Use High Quality Audio: The quality of your audio is essential, as people are more likely to listen to an ad if it sounds good. Make sure the audio is clear and free of background noise.

Keep It Short And Sweet: People have short attention spans, so it is essential to get the message across quickly and concisely. Aim for content that is 30 seconds or less.

Use A Catchy Hook: The first few seconds of the audio are crucial for grabbing someone's attention. Use a strong hook that will entice people to want to listen more.

Use Clear And Concise Language: Avoid using jargon or technical terms that the target audience might not understand.

Specific Methods To Enhance The Effectiveness Of **COLORS**

Choose Colors That Evoke The Right Emotions: Different colors evoke different emotions in people. For example, red is often associated with passion, excitement, and danger, while blue is associated with calmness, trust, and security. Choose colors that evoke the emotions you want to associate with the message.

Use Color Contrast: Color contrast is the difference in brightness, hue, and saturation between two colors. Using color contrast can make the message more visually appealing and easier to read.

Specific Methods To Enhance The Effectiveness **IMAGES**

Use High Quality Images: The quality of images is essential, as people are more likely to be engaged with high-quality images. Ensure the images are clear, sharp, and well-lit.

Use Images That Capture Attention: Images used should be eye-catching and attention-grabbing. Use bright colors, interesting patterns, and bold fonts to make the images stand out.

Use Images That Convey The Message: The images should convey a message clearly and concisely. Ensure the chosen images are relevant to the cause and support the desired message.

Use Images Consistent With The Message: The images should be consistent with the message's overall look and feel. Ensure the images chosen to reflect desired outlook and perception.

Specific Methods To Enhance The Effectiveness Of **WRITING**

Use Strong Headlines: Headlines are the first thing people will see, so they need to be attention-grabbing and relevant to the message.

Use Clear And Concise Language: People have short attention spans, so you want to get the message across quickly and concisely. Avoid using jargon or technical terms that the target audience might not understand.

Use Active Voice: Active voice is more engaging than passive voice.

Use Personal Pronouns: Personal pronouns like "you" and "your" help to create a connection with the reader.

Use Storytelling: Stories are a great way to connect with the audience and make the message more memorable.

Use Social Proof: Social proof is a psychological phenomenon stating that people are more likely to do something if they see others doing it.

Use Scarcity: Scarcity is a psychological phenomenon that states that people are more likely to want something if they think it is scarce.

Use A Call To Action: A call to action is a statement that tells the reader what the desired action is. Make sure your call to action is clear and easy to understand.

Software Tools And Applications

Ubuntu Studio is a derivative of the Ubuntu Linux distribution and is created for general multimedia production work. This Linux Operating System has many pre-configured software applications ready for multimedia content creation to support mission operations.

--	-----

THIS PAGE INTENTIONALLY LEFT BLANK

Foreword

From a military commander's perspective, the role of psychological operations (PSYOP) in the successful planning and execution of modern military operations is absolutely essential. The recent successes of PSYOP in Panama and the Persian Gulf amply demonstrate its importance in achieving our military objectives and national goals. PSYOP is an integral part of the United States Special Operations Command mission. Today, the military faces a dynamic and unpredictable world. PSYOP will remain a valuable instrument in our overall defense posture and will be a key asset in the fulfillment of US national policy.

Psychological Operations: Principles and Case Studies serves as a fundamental guide to PSYOP philosophy, concepts, principles, issues, and thought for both those new to, and those experienced in, the PSYOP field and PSYOP applications. This book clarifies the value of PSYOP as a cost-effective weapon and incorporates it as a psychological instrument of US military and political power, especially given our present budgetary constraints. The authors contribute to the understanding of psychological operations by presenting diverse articles that portray the value of the planned use of human actions to influence perceptions, public opinion, attitudes, and behaviors so that PSYOP victories can be achieved in war and in peace. The four sections classify articles with related themes into a common category.

Part I offers an overview of the nature and scope of PSYOP and serves as an introduction to the overall nature, historical background, concepts, and principles of psychological operations. These independent articles, which reflect the broad scope of historical development and thought about PSYOP, are intended to be a foundation for understanding the basic nature and key elements of PSYOP.

Part II follows with issues and influences related to developing effective US strategy, doctrine, and structure for conducting psychological and political warfare. The authors focus on those

psychological issues and roles that have been recurrent as our national policy, objectives, and strategy have been formulated and implemented. They explain historical and contemporary elements of the national policy process and the framework within which national PSYOP policy is formulated, administered, and implemented.

Part III deals with the objectives and activities of strategic, tactical, operational, and other types of PSYOP. These authors emphasize that all forms of PSYOP should primarily support the attainment of national policy and objectives. They conclude that the key to all US PSYOP is credibility of the message as defined by the influencing or changing of perceptions, attitudes, and behaviors through utilization of words and actions.

In Part IV the authors use case studies to present and clarify PSYOP goals, roles, and methods. One of the editors of this book condenses and analyzes (1) US and Vietcong PSYOP in the Vietnam War and (2) the Iraqi propaganda network. The other writers examine tactical and consolidation PSYOP activities in Operations *Just Cause* and Promote *Liberty* in Panama. They address (1) our national antidrug policy and its relationship to the role of military psychological operations and (2) the importance of the political-psychological dimensions of conflict and insurgency.

By addressing the breadth and depth of psychological operations thought, this collection of PSYOP articles serves as a valuable knowledge base for those who read it. A major purpose of the book is to pull together those previously published articles under one cover in one volume. *Psychological Operations* should stimulate your thinking and reinforce the value of PSYOP.

A handwritten signature in black ink that reads "Frank L. Goldstein". The script is fluid and cursive, with the first letters of the first and last names being capitalized and prominent.

Frank L. Goldstein, PhD
Col, USAF
Dean of Research
Air Command and Staff College

Preface

This book explores the breadth and depth of fundamental PSYOP roles, principles, and methods. Many of these readings were previously published in professional journals. *Psychological Operations: Principles and Case Studies* is not a collective work and does not attempt to be. Each article is an independent effort and together they represent a cross section of what the "best and brightest" feel is key to both offensive and defensive psychological operations. What the 24 contributors share, besides their own particular expertise in PSYOP, is a recognition that a clear understanding of PSYOP is important to our national defense and to the way PSYOP should be conducted in the future.

Understanding PSYOP is not a simple task. Historically, both military and civilian discussions of PSYOP throughout the leadership spectrum have regularly substituted cliches, myths, and untruths for hard evidence or analysis of what PSYOP is and how it can serve our national objectives. PSYOP policy and doctrine have not received their deserved attention while hostile PSYOP efforts against the US are misunderstood and often ineffectively countered.

Although the Soviet threat has ended, three Soviet PSYOP articles are deliberately included because the classic Soviet PSYOP model has been taught and integrated into third world countries all over the world and will continue to be an influence in the international arena.

In 1984, a major effort began to revitalize the state of psychological operations in the United States. That effort was spearheaded in 1985 by a document known as the DOD PSYOP Master Plan. The plan evolved over several years and revision began again in 1990, just prior to the Persian Gulf War. The plan directed the overall revitalization of US psychological operations; it directed that PSYOP be fully integrated into planning and military operations; it directed that PSYOP be considered for immediate and effective use in crises and hostilities; and it directed the use of overt PSYOP programs in

peacetime. The plan presented an across-the-board baseline of problem areas and laid out specific remedial actions for fundamental improvements in our capability to employ PSYOP in peace, crisis, and war.

This volume is also an ongoing effort. While the collected articles will expand both the knowledge and understanding of psychological operations past and present, many of these authors would not have written their articles without the initial revitalization-and Air University Press may not have published them had they been written. The essays present critical PSYOP issues, problems, activities, and techniques in the book's four sections, which classify articles with related themes into a common category.

We must underscore the fact that these essays are independent of each other. Many were written and published decades ago, and most were originally published in differing formats with differing style requirements. Those that were written in the present tense years ago have been edited to reflect the past tense. We have retained the original flavor of each essay, but some style changes have been made to conform more closely to current Air University Press style. Some essays have notes, some don't; some have bibliographies, some don't; some have appendixes, some don't. We have retained the original styles, with this exception: Notes number 1 that appeared at the titles of some original essays have been removed and the references thereto have been moved to the bottom of the first page.

We are grateful to the 24 contributing authors and regret that we could not include biographical information on all of them; unfortunately, we were unable to obtain biographical data on Preston S. Abbott. We thank J. Schmier, B. Karabaich, and C. Williamson, who provided assistance to MSgt Blair and Col Goldstein, and we are especially grateful to Maj Thomas P. Sands, Florida ANG, who provided editorial assistance to the entire project in its early stages. We also extend our gratitude to those who provided outstanding administrative and technical support. In particular, Majors Stephen Asher, USAF, and James V. Keifer, USAF, Retired; Ms Victoria L. Blessing and Ms Eva E. Hensley; SFC Roger D. Crocker, USAR; SSgt Sherri Adler, USAFR; Sgt Manuel D. Gonzalez, USAFR; and A1C Jayme L. Laurent, Florida ANG.

PART I

Nature and Scope of
Psychological Operations
(PSYOP)

THIS PAGE INTENTIONALLY LEFT BLANK

Introduction

The scope of military PSYOP during World War II, the Korean War, and in much of the 1960s was primarily limited to combat propaganda and psychological warfare (psywar). During those times, it was accepted as a specialized tactical application and as a subordinate operation. The experiences of these conflicts, especially the Vietnam War, convinced some American military and political leaders that the psychological dimension of national power and conflict encompasses diverse elements 'and many activities-nonmilitary as well as military-in both peacetime and war in support of our national policy and objectives. Its scope can vary from the tactical battlefield to the operational theater to the strategic levels of conflict to national political and military goals.

Part I serves as an introduction to the overall nature, historical background, and concepts of PSYOP, and to some principles that can be used for training in the field of psychological operations. The independent articles in this section reflect the broad range of historical development and thought about PSYOP and are intended to be a foundation for understanding the basic nature and key elements of PSYOP.

Col Frank L. Goldstein, USAF, and Col Daniel W. Jacobowitz, USAF, Retired, provide a general introduction to and a commonly accepted definition of PSYOP. The authors explore the three types of PSYOP and give several examples of strategic, tactical, operational, and consolidation PSYOP. They divide propaganda into white, gray, and black classes, and present the various resources of psychological operations. The six major military objectives of PSYOP are condensed for the reader.

The late Col Fred W. Walker, USAF, Retired, presents strategic concepts for military PSYOP to enhance the overall understanding of the PSYOP dimension and its challenges. His emphasis is on the public's understanding that the US government does not engage in public disinformation activities in pursuit of national policy. He addresses strategic rather than tactical battlefield and operational PSYOP. He focuses on the concept that "truth is the best propaganda" and analyzes

efforts to counter Soviet global disinformation. Walker died before the dissolution of the Soviet Union; however, the article represents a clear and precise use of Soviet PSYOP between 1917 and 1990.

Col Alfred H. Paddock, Jr., USAF, Retired, provides a brief perspective on the evolution of military PSYOP. He addresses the 1985 Department of Defense (DOD) PSYOP Master Plan as the major framework for rebuilding worldwide military PSYOP capabilities in support of national objectives in peace and crisis and at all levels of conflict. Colonel Paddock presents several essential themes for remedial actions-developing comprehensive joint PSYOP doctrine, developing an adequate number of #PSYOP planners on joint staffs, and improving commanders' understanding of PSYOP capabilities and missions.

Col Benjamin F. Findley, Jr., USAFR, analyzes the many similarities between civilian business marketing and military PSYOP. His premise is that, just as marketing and promotion processes in business have dedicated necessary resources and utilized persuasive strategies and tactics to successfully influence perceptions, motivations, attitudes, and opinions to achieve results, so military PSYOP can and should employ similar approaches to market our country. Colonel Findley focuses on basic persuasion and marketing principles and on business lessons learned.

Psychological Operations

An Introduction

Col Frank L. Goldstein, USAF

Col Daniel W. Jacobowitz, USAF, Retired

If your opponent is of choleric temper, try to irritate him. If he is arrogant, try to encourage his egotism. If the enemy troops are well prepared after reorganization, try to wear them down. If they are united, try to sow dissension among them.

— General Tao Hanzhang; translated by Yuan Shibing
Sun Tzu's Art of War: The Modern Chinese Interpretation

PSYOP is a vital element within the broad range of US political, military, economic, and ideological actions. Properly employed, PSYOP reduces the morale and combat efficiency of enemy troops and creates dissidence and disaffection within their ranks. Psychological operations can promote resistance within a civilian populace against a hostile regime or be employed to enhance the image of a legitimate government. The ultimate objective of American PSYOP is to convince enemy, friendly, and neutral nations and forces to take action favorable to the US and its allies. Because of the nature of the parent society and the comparative ease of detecting falsehood in a multimedia world, US overt PSYOP campaigns are limited to presenting factually correct material. It would be disingenuous to claim that a balanced picture is presented in US propaganda, but the actual material presented in any particular overt PSYOP message will be verifiable against independent sources.

Truth and falsehood in propaganda must be separated from overt and covert operations and the issue of white, gray, and black (false) propaganda. Overt propaganda is produced by a government or organization that takes responsibility for it. Because of police state conditions or tactical considerations, it

may have to be disseminated by covert means, such as agents who risk their lives to transport and distribute the materials. Overt propaganda may be true or false. Since the effect of propaganda depends on credibility, overt sources that utilize falsehoods quickly lose all effectiveness. Overt propaganda is also known as white propaganda because the source takes responsibility for it. Gray propaganda is material that is distributed without an identified source. It may be true or false. Black propaganda is material produced by one source that purports to have emanated from another source. Such covert productions may be used to damage the credibility of a white (truthful) source by disseminating obvious falsehoods under the label of the previously trusted source. Black propaganda-if effective at all-quickly loses effectiveness unless the populace is particularly susceptible to rumors, manipulation, and distortion of fact. Nevertheless, black propaganda can be highly effective if properly planned. For example, should intel sources determine that an invasion is imminent, broadcasting that fact under an aegis purporting to be that of the potential invader removes all surprise and falsifies all the invader's claims of a "just" war.

Propaganda may legitimately be economical of the truth. For example, in describing the triumph of democracy there is no particular obligation to discuss the role of Boss 'tweed in urban politics.

Military psychological operations are inherently joint operations. Unified, joint task force, and other military commanders identify target audiences and develop PSYOP themes, campaigns, and products. These are submitted through channels to the joint chiefs for approval. The principles of developing a PSYOP campaign are applicable across the operational continuum. Although the complexity of the methodology varies with the level of conflict, considerations for development of PSYOP campaigns are the same for counterterrorism as they are for global war.

The psychological dimension covers the battlefield as well as the effects upon the soldiers fighting the battle, their military leaders and staffs, the political leaders, and the civilian population. On the field of battle, US forces want to face an enemy who is both unsure about his cause and capabilities

and sure about his impending doom; an enemy who, even if unwilling to surrender, has little will to engage in combat.

It is US policy that psychological operations will be conducted across the operational continuum. It must be understood that psychological operations are conducted continuously to influence foreign perceptions and attitudes in order to effect changes in foreign behavior favorable to US national security objectives. Any type or level of PSYOP can be conducted at any point along the operational continuum. The operational environment in which psychological operations are conducted does not, by itself, dictate or limit PSYOP actions or the level of PSYOP applied.

In environments short of declared war, national PSYOP policy is normally derived from official policy statements and declarations on US foreign policy as well as national security policy. Interagency coordination is required. During declared war, the policy emanates from the national command authorities (NCA) upon approval of plans submitted by the Office of the Secretary of Defense (OSD). This national policy is executed through a strategy of coherent international information programs, which consist of US information dissemination efforts dealing with policy and information. It is essential that PSYOP themes and products reflect and support national policy, these overt messages are as official as any White House press release. Therefore, appropriate PSYOP policy and strategy must fully integrate Department of Defense (DOD) PSYOP into these international information programs to alleviate the potential for disseminating contradictory information.

Psychological actions such as show of force, cover, and deception have been used throughout history to influence enemy groups and leaders. Modern psychological operations are enhanced by the expansion of mass communication capabilities. Nations can multiply the effects of their military capabilities by communicating directly to their enemies a threat of force or retaliation, conditions of surrender, safe passage for defectors, incitations to sabotage, support to resistance groups, and other messages. The effectiveness of this communication on the target audience depends on their perceptions of the communicator's credibility-does the

communicator have the capability to carry out the threatened actions?

PSYOP actions convey information not only to intended target audiences but also to foreign intelligence systems. Therefore, PSYOP messages must be coordinated with cover and deception plans and activities, along with operational security planners, to ensure that essential secrecy is realized and that PSYOP messages reinforce cover and deception objectives. Skillful content analysts can determine overall intentions by carefully analyzing PSYOP messages and PSYOP planners can screen their own products to ensure that only the overt intention is broadcast. The methodology of overt propaganda analysis is arcane and difficult, as much derived from art as science. Some practitioners believe the method is more valid when aimed at totalitarian propaganda than PSYOP produced by democracies. Democratic propaganda normally is far less patterned, possibly because the products reflect a less organized process-ad hoc arrangements, swiftly evolving policies, lack of hidden agendas, or, frequently, no agendas at all. Totalitarian-especially communist-propaganda may be easier to analyze because it is highly formalized and patterned.

There is a psychological dimension within any element of national power projection, particularly the military element. Foreign perceptions of US military capabilities are fundamental to strategic deterrent capability. Therefore, US policymakers must articulate our national and military actions (if we don't, others will). Communicating unambiguously to allies, enemies, and neutrals is a key element of US national strategy. The effectiveness of deterrence, power projection, and other strategic concepts hinges on our ability to influence the perceptions of others.

For these communications, any player in the US government or overall body politic may become an important tactical element regardless of the strategic position that the player holds. In conveying the will of the United States, the firm set of the president's jaw in drawing "a line in the sand" may have as much influence on international, and especially adversarial, understanding of US policy as the actions taken by the government. Supporting statements by other officials, including the secretary of state, congressional leaders, and

military commanders, similarly are tactical elements carrying out the information strategy. Tactical actions of this nature, delivered at the strategic level, are analogous to the actual tactical delivery of weapons to targets of a strategic nature in a shooting war. Since much of policy is devoted to achieving national goals while ameliorating genuine conflict and avoiding a shooting war, tactical performance of these roles by strategic elements of the political/ military system is critical to national policy. One of the benefits of the open political process-disseminated and monitored by a free and aggressive media-is that individuals who would be inadequate tactical communicators tend to be shunted away from positions for which the nation's fate requires skillful performance. Military PSYOP may be undertaken at the strategic level, augmenting other national communications systems, particularly in areas for which the peacetime national systems-such as the United States Information Agency-have no access.

In every case, it is crucial that military PSYOP be integrated with other national communications, since the audiences will accept military PSYOP messages as official positions. To ensure this process, military psychological operations rely on a planned, systematic process of conveying messages to, and influencing, selected foreign groups. The messages conveyed by military PSYOP are intended to promote particular themes that result in desired foreign attitudes and behaviors. Therefore, PSYOP may be used to establish and reinforce foreign perceptions of US military capability, determination, and responsiveness to US political goals and to support overall US policy.

Psychological operations are an important dimension of overall military operations. They may be used by commanders to influence the attitudes and behavior of foreign groups in a manner favorable to the achievement of US national objectives. Thus, the principal purpose of DOD PSYOP is to persuade foreign audiences to change or enhance attitudes or behaviors in a manner favorable to one or more national security objectives. Additionally, PSYOP can counter foreign propaganda that adversely affects the achievement of US objectives.

The United States typically distinguishes between PSYOP on a strategic level and PSYOP on a tactical, battlefield level.

Strategic psychological operations are usually considered an aspect of public diplomacy and are normally established and guided by intergovernment working groups created for a particular short-term situation or regional area of concern. The intergovernment groups meet periodically to clarify strategic PSYOP policy in light of political and military developments of the day. At the present time, however, the US government has no permanent mechanism to institutionalize this process.

In tactical or battlefield PSYOP, commanders use such techniques as loudspeaker broadcasts and leaflet drops with the intent of generating a force multiplier without having to increase force size. Psyopsers support tactical deception, counterterrorism, counterpropaganda, and other nontraditional means as the tactical situation merits. PSYOP messages cannot replace tactical performance or redeem inadequate training, weapons, or tactics that result in poor combat performance. However, the methodology can increase the overall functional degradation of enemy capability. Missiles, bombs, bullets, and maneuvers establish the context for PSYOP multiplication and hastening the cumulative results of tactical competence. Psychological operations speed the positive effects of military prowess, and may, under certain conditions, delay the consequences of military failure. Because psychological operations multiply desired effects, positive outcomes can result in quicker victory at lower cost in material, time, and casualties. Whether strategic or tactical, PSYOP uses any available means of communication to achieve desired ends. In Western circles, truthfulness is a desirable goal in itself, and is the principal means for building credibility among targeted audiences. Success in PSYOP rests on thorough analysis and planning.

Modern PSYOP planning includes a target analysis that consists of several phases. The first phase identifies possible target audiences. Once the target audience is identified, such target characteristics as vulnerabilities, susceptibilities, conditions, and effectiveness are analyzed. Vulnerabilities are the four psychological factors that affect the target audience: perception, motivation, stress, and attitude. Susceptibilities include the degree to which the target audience can be

influenced to respond to the message it receives. Conditions of the target audience include all environmental factors-social, economic, political, military, and physical-that influence the target audience. Audience effectiveness is the capability of the target audience to carry out the psyopser's desired response. The concept of audience effectiveness is fundamental to PSYOP success at strategic and tactical levels. If the goal is functional destruction of an enemy tactical unit, the effective audience may be individual soldiers, who may be persuaded to desert, defect, or defect in place; that is, simply fail to perform without overtly resisting their commanders. Other goals may require finding different effective audiences. The responsive audience in a battlefield air interdiction campaign could be the civilian workers who repair damaged railroads and bridges. Truthfully reporting that they are at risk from restrikes of previously damaged targets may dissuade them from voluntarily working. However, if they are slave laborers, the audience may be nonresponsive regardless of their susceptibility. The responsive audience may be taskmasters, or high-level commanders. For example, the susceptibility of the high-level audiences may be threats of war crimes prosecution. Both audiences will have to be convinced, by multiple messages, if the campaign is to be effective. Once the above analysis of audiences is accomplished, the psyopser seeks to determine the specific psychological plan that supports the national objective.

Psychological operations have been a part of military strategy since armies first took the field of battle. The Persian Gulf War and the employment of PSYOP by both sides were the most recent chapter in a long history of PSYOP as an integral part of military strategy. Throughout much of military history, PSYOP's presence has been felt in battlefield campaigns. Psychological operations were integrated into the commander's scheme of maneuver before the label of PSYOP was invented and without the benefit of thorough or scientific planning. An early example of how PSYOP was planned and applied in ancient battle is contained in the writings of the Chinese strategist Sun Tzu, who stated that the most noble victory was to subdue his enemy without a fight. Another was the successful exploits of Genghis Khan (the Mongolian

general Temujin), who would soften his enemy's will to resist by spreading rumors about his own army's strength and fierceness. His planning was simple and, seemingly, relevant and effective.

As early as the Battle of Bunker Hill, colonial military PSYOP operators used leaflets designed to work on the susceptibilities of the effective audience. Leaflets distributed among British troops in Boston by trusted colonial agents were based upon analysis of the situation and the conditions the British troops anticipated, as well as their motivation. Thus, some leaflets reported that food and provisions among the colonial troops were far superior to the hardtack fed the British, and that switching sides would result in an immediate improvement in diet. More important and effective was an appeal to a basic desire to improve the British soldier's status in life, an important factor in motivating enlistment. Many troops had joined merely to obtain subsistence or with the hope of achieving enough riches to obtain farmland. The most effective message slightly pointed out that to obtain land in the colonies, a soldier needed merely to desert and walk west until he found a suitable plot. Hessian mercenaries in particular responded to this appeal later in the war, and a considerable number of the present-day Pennsylvania Dutch owe their ancestry to the effectiveness of this appeal as these soldiers settled in a language-compatible area in which they were unlikely to be turned over to British authority. Colonial strategic psychological operations were masterful from inception, with Thomas Jefferson and Thomas Paine effectively working their various chosen audiences while Benjamin Franklin used his post in France to bolster not only continental support-which eventually resulted in the Franco-American force that was victorious at Yorktown-but also helped bring Lafayette, Pulaski, and Kosciuszko to American shores. The campaigns within Britain that drained political support for the war were most effective. Battlefield competence was important to the success of this effort and included not only victories at Trenton and other places but also the amazing raids by John Paul Jones upon English coastal towns, whose political effect far outshone their minimal military importance. James H. Doolittle's raid on Japan-undertaken for the same purposes

and with analogous military results-was foreshadowed in methodology and in equivalent technological means almost 150 years before.

In the American Civil War, both sides of the conflict directed strategic campaigns at England in the hope of winning support for their respective causes. It remains questionable, however, that these campaigns had been formally planned and that the proper resources were marshaled to execute them. The Southern campaign was virtually undercut by the Confederate refusal to sell cotton to Great Britain. This economic suicide overwhelmed any positive effects that media campaigns may have engendered.

During World War I, PSYOP came into its own as a formal activity. Almost all countries involved in the war used forms of strategic and tactical PSYOP. Many countries formed military units specializing in propaganda. These units' primary duties included distribution of leaflets by balloon and aircraft. The linkage among planning, resource mobilization, and execution by these agencies appeared to be an uncomplicated matter. How the PSYOP details were integrated into the shooting war of the day, or how well PSYOP induced surrenders, was not recorded for history. What is known, however, is that surrenders occurred with a positive correlation to PSYOP activities. Thus, military analysts began taking a new look at PSYOP as an ingredient with surprising impact on the battle. Psychological operations were a resource because they induced stress on both civilian and military forces of the enemy.

During World War II, propaganda activities became known as psychological warfare (psywar). Public broadcast radio, about 20 years old at this point, was called into play. Tank-mounted loudspeakers with a range of approximately two miles amplified the ability of the human voice to reach opposing combatants. Besides media programs, military actions were undertaken for their PSYOP effect. The Doolittle raid against Japan was considered an important PSYOP event for at least two reasons. The carefully planned raid demonstrated credibly to the Japanese that the US could reach and bomb their homeland, prompting them to take unnecessary steps for home defense. More important perhaps, news of the

success back home caused morale to soar in an American population desperate for a victory. Planning, mobilization, and execution all worked in this one instance. However, it must be noted that during this war, aircrews frequently expressed reluctance to risk themselves on leaflet-dropping missions because they lacked confidence in that methodology as a means of bringing victory nearer.

In the years that followed, PSYOP matured as a combat force multiplier, albeit through a series of starts and stops. During the 1950s, the Soviet Union made great strides in both strategic and internal PSYOP. Soviet client-states began very elaborate psychological operations for foreign insurgents and home conscription. At the same time, little was apparently being planned in Western PSYOP circles.

Although strategic and tactical psychological operations were effectively integrated by the North Vietnamese during the Vietnam era, US PSYOP planning was not effectively formalized or coordinated with operations and troop mobilizations. It was in Vietnam that propaganda activities assumed the current term PSYOP-and television was a new medium. The North Vietnamese mastered the art of using the international media, particularly television, for their PSYOP. The US government was ineffective in both public information and public policy in mobilizing its public for the war. As a result of this negative experience in Vietnam, the US government learned the importance of domestic and foreign support of major policy goals.

In the more recent conflicts, PSYOP has been integrated with combat operations. In the Falklands, Afghanistan, Africa, South and Central America, Grenada, Panama, and the Persian Gulf, PSYOP was included by all parties. PSYOP even became a critical part of the terrorist mode of operations during the seventies and were part of the Iraqi PSYOP plan when they threatened terrorist activities.

Any student of PSYOP will quickly learn how important PSYOP can be in political and military strategy. What every student should strive for is an internalization of the concept proposed by Sun Tzu, the Chinese military strategist, that to fight and conquer in all your battles is not supreme excellence; supreme excellence consists of breaking the enemy's

resistance without resorting to fighting. Because soldiers and civilians have not fundamentally changed in nature or psychology since Sun Tzu wrote these observations, they remain appropriate today.

THIS PAGE INTENTIONALLY LEFT BLANK

Strategic Concepts for Military Operations

Col Fred W. Walker, USAF, Retired*

For many years, people have indicated a lack of understanding ~of exactly what military psychological operations (PSYOP) entail. News media refer to PSYOP as psychological warfare (psywar) and imply that there is some nefarious objective or purpose in such action. They usually indicate that there is some element of deliberate misinformation-or even some public lies-involved in such activity. It is time that these misperceptions were set straight. The public must understand that the United States government does *not* engage in public disinformation activities in pursuing national policy. This article concentrates on peacetime strategic concepts, setting aside the loudspeaker and leaflet activities of the battlefield.

Joint Pub 1-02, *Department of Defense Dictionary of Military and Associated Terms* (1 December 1989) broadly defines strategic psychological activities as "planned psychological activities in peace and war which normally pursue objectives to gain the support and cooperation of friendly and neutral countries and to reduce the will and the capacity of hostile or potentially hostile countries to wage war."

This is demonstrably any program that supports a long-term effort to achieve a national or regional foreign policy objective through persuasion. We might consider the term *persuasive communications* to mean the same thing as psychological operations.

How did we become focused on strategic psychological activities? Quite fundamentally, various administrations assessed that the United States was falling behind in world

*Deceased 1990.

influence because the global propaganda and disinformation efforts of the Soviet Union were directed against US foreign policy objectives. As a result of this assessment, President Ronald Reagan directed the Department of Defense (DOD) to revitalize its psychological operations capabilities and use them to support national security objectives in all legal and proper areas.

Secretary of Defense Caspar W. Weinberger ordered an extensive study on how best to implement the president's direction. This action resulted in a master plan to revitalize military capabilities and better apply them to support long-term peacetime national security objectives. Key elements in his plan involved (1) separating the profession of PSYOP from the more narrow field of special operations and (2) significantly restructuring staffs and units. He also recommended enhanced interagency coordination.

It is important to stress the fact that US military psychological operations in peacetime do not involve misinformation or anything related to the Soviet concept of disinformation. Truth must be our guideline in every undertaking. After World War II, Dick Crossman, the British master of international influence activities, counseled that truth is the very essence of strategic peacetime foreign policy efforts and that it should be our fundamental guideline. US policy must endorse his astute recommendation.

DOD is still engaged in a period of transition to revitalize its military PSYOP capabilities. We envision a number of strategic roles and missions, all of which support objectives derived from published national security policy.

According to the annual defense guidance document, our fundamental national security objective is to deter conflict. This is clearly a psychological phenomenon because it occurs in the mind of a potential enemy. When an enemy perceives that it would be too costly for him to attack or that he would probably lose if he started a war, then he elects not to attack and conflict has been deterred. His mental decision, based upon his perception of our capabilities and resolve, is the key element in the process of deterrence. Military PSYOP in support of this fundamental defense objective, then, should seek to clarify and focus this perception.

Military PSYOP programs designed to enhance deterrence should include those that support arms control talks as well as those that clarify and explain national aims for strategic nuclear force posture. Efforts to clearly describe our policies for peaceful military uses of space and the strategic defense initiative (SDI) can readily be listed as contributing to deterrence. The fact that the term *star wars* was publicly attached to the SDI program aided the Soviets considerably in their propaganda campaigns against it. There were two reasons for this: (1) the term evoked subconscious perceptions of science fiction and fantasy among various public audiences and (2) "wars" is perceived as aggressive rather than defensive. As a result, there was little support for the program. Nevertheless, little was done to decouple this negative terminology. In the future, more must be done to properly support national policy.

A simple thing like terminology can indeed be a major factor in various public audiences' acceptance of or support for any policy. Recent history shows that the term *neutron bomb* was a key element in the Soviets' eminently successful campaign a decade ago to prevent President Jimmy Carter from deploying enhanced radiation weapons in Europe. In like manner, we can recall how our national leaders were duped into referring to Iranian terrorists and kidnappers as students at the outset of the Iranian Embassy hostage debacle in 1979. These are clear examples of how terminology can sway public perceptions on a global basis.

Certainly, strategic military PSYOP programs should play a significant role in countering terrorism. In addition to gaining some control over media terminology, we need information programs that will disassociate terrorist groups from pockets of popular support. Such programs should publicly impugn the worth of the terrorists' objectives and denigrate their leadership. We should also seek to reduce their internal cohesion and cause them to waste their resources defensively; for example, in hiding and vetting new members.

Above all, we should seek to positively influence foreign policy efforts to reduce or eliminate foreign governmental support to terrorist groups. With firm evidence that the governments of Libya, North Korea, and Cuba support various

terrorist groups, we can and should make publicly supported diplomatic efforts against such governments. Although we have the capability to do this, there are tremendous administrative and bureaucratic hurdles to surmount in developing such programs.

There is a major role to play in countering global disinformation efforts as used by the former Soviet Union. A thoroughly documented Soviet disinformation campaign attributed the cause of acquired immune deficiency syndrome (AIDS) to the Central Intelligence Agency (CIA) and DOD experiments to develop biological warfare weapons. While this was a total falsehood and seemed preposterous to most Americans, the disinformation was found credible by several audiences elsewhere in the world. We are only at the beginning of the level of fear that this epidemic can cause in our world, but the Soviets and others recognized early on that fear inhibits rational thinking and vastly enhances the effectiveness of their propaganda and disinformation.

The second phase of their AIDS disinformation campaign began surfacing in foreign public news items that accused US military personnel stationed overseas of spreading AIDS in various host nations. News stories and leaflets with this theme appeared in the Philippines, Africa, and the Middle East. The obvious objective was to undermine US military presence and influence on a global basis. Still a foreign policy problem, it could be helped by a comprehensive and coordinated foreign policy that vigorously exposes and describes disinformation campaigns while pointing out extensive US efforts to control the disease.

Many are probably not aware that the Soviet Union engaged in a sinister and very dangerous game of economic warfare against the United States. The area of strategic metals provides a good example. Africa was the most visible battlefield in this subtle economic struggle, having as it does an abundance of these resources easily and economically available. The US is about 10 percent self-sufficient (within our borders) in supplies of this type; the USSR was about 90 percent self-sufficient. Metals such as chromium, cobalt, zirconium, titanium, and tantalum are essential to any modern high-technology industrial society. The military

dimension is obvious from the extent to which defense systems depend on technology.

The Soviets attempted to keep their supplies in the bank—mostly in Siberia, under the ice. They were content to compete with the US on the world market, thus driving up the price. In various countries of Africa, we saw propaganda, disinformation, and guerrilla warfare drive the price up and the Americans out. In Zaire, this combination of activities caused a 600 percent price increase for cobalt in a two-year time period (1979-81). Now, years later, we are still wondering how to gain control of this issue.

Other areas on the economic warfare front were international financing (manipulating debtor nations and credit extensions), protectionism (still an issue), and peaceful uses of nuclear energy. Propaganda in these areas is increasingly more subtle and less noticed, but it should be monitored. Resulting evaluations should be placed in our national security and foreign policy development processes. And we must ensure that the military dimension is properly coordinated.

There is a military dimension in negotiations on the law of the sea—treaties involving fishing rights, oil drilling, navigation rights, and seabed mining. We also have legitimate national security interests in extradition treaties for terrorists and drug traffickers.

Persuasive communications in peacetime may be accurately likened to advertising and public relations programs. Secrets to success involve getting the facts out in clear and understandable ways, relating these facts to perceived human needs, and ensuring enough repetition so that the message is received and reinforced. Various target audiences have differing perceived needs, scripts, and priorities; therefore, the same message must be packaged in different ways in order to appeal to a wider spectrum.

The United States government has a wide variety of communication channels. Each major government agency has offices whose purpose is to announce its policies and explain how its activities support national policies and goals. The United States Information Agency is specifically charged with informing peoples in foreign nations about US policies and describing American culture and our democratic way of life.

This is done through speakers and seminars, press conferences, and various publications. Radio and television programming, such as the "Voice of America" and the new "Worldnet," are able to reach vast audiences.

Areas where there is the most room for improvement are in (1) coordinating various government agencies and (2) packaging the message to fit the audience. Often in crisis situations or periods of tension, the need for rapid response inhibits coordination among various branches of the government. Officials tend to couch their statements in terms they are comfortable with and to speak from their personal points of view, neglecting to consider the cultural aspects and aspirations of foreign audiences. Improvement in these areas is absolutely essential for more effective communications.

Repetition is also necessary. Government officials are busy people; they tend to make policy statements once, and then get on to the next item of business. But policy statements don't necessarily have a life of their own. Unless repeated in various ways and related anew to emerging situations, they tend to submerge in piles of records and gather dust in archives.

The Soviets clearly demonstrated that the most blatant lies can be successfully put across through massive repetition of disinformation and propaganda. In fact, repetition was the secret of their success. Some Soviet propaganda lines were constantly repeated for 50 years; although there was not a single economic success story arising out of a communist or socialist system, belief in this big lie continued over much of the world. People are still willing to give up their freedom for a dream that is inconsistent with the human condition. This is the threat we face from the competition.

Initial changes by Mikhail S. Gorbachev to the Soviet global propaganda machine reflected a stepped-up effort to supplant US power and influence. After the Twenty-seventh Party Congress in the spring of 1986, their propaganda apparatus was restructured and even more centralized. The International Information Department was disestablished and its responsibilities were consolidated within the International Department (ID) and the Propaganda Department (PD). The PD had been responsible for internal domestic propaganda. After

the changes, it had oversight for several activities oriented toward foreign audiences; for example, Tass and Novosti as well as Radio Moscow. This move reflected the theory that foreign propaganda and domestic propaganda are intimately linked, and that greater efficiency can be gained through centralization.

At the same time, Gorbachev's reforms (under his program of glasnost) were being widely touted in the West. Many were led to believe that this change represented a welcome softening of formerly hard Soviet propaganda lines. In fact, one of the major propaganda efforts to sugarcoat this program sought to convince people that the term glasnost meant "openness." A more accurate translation would be "publicity." Proper translation is not simply a semantic game; it shaped the debate on effective policy response toward the USSR.

Most analysts feel that the real intent of glasnost was not to create an open society, but to consolidate Gorbachev's power by modernizing the system and ending economic stagnation. Carefully staged events, such as the Moscow Peace Forum, dissident releases, rock concerts, and television shows, sought to take advantage of easily co-opted Western participants in order to improve external opinion of the Soviet Union, further Soviet propaganda lines, and secure badly needed Western technology.

Those events should have been viewed with extreme distrust, inasmuch as they represented a quantum leap in Soviet propaganda sophistication. We saw significant improvements beginning under Yuri V. Andropov's administration, with expanded use of professional psychology and psychiatry along with infusions of equipment and talent that increased the quality of Soviet PSYOP. Under glasnost, we watched a merger between these professional propagandists and the innocent Western media. It was and is a dangerous and threatening evolution.

Still, the Soviets lost control of glasnost, affording an opportunity to project democratic messages to various Soviet audiences while those channels were open.

If US government agencies can improve their coordination and persuasive communications capabilities, we may be able to slow and then reverse our losing trend in exerting world

influence. Propaganda and disinformation that seek to cause people to trade freedom for lies is a most insidious and dangerous threat, and freedom is far too precious a thing to be defended by haphazard efforts. We do have one significant advantage: There is no need to lie because properly packaged truth is the very best propaganda.

No More Tactical Information Detachments

US Military Psychological Operations in Transition

Col Alfred H. Paddock, Jr., USA, Retired

US military PSYOP today faces an uncertain future. This paper provides a brief perspective on the evolution of US military PSYOP during the twentieth century, examines the conditions that led to a revitalization of these capabilities during the 1980s, contrasts this revitalization with the international and domestic environment faced by the Department of Defense (DOD) today, and outlines some of the major challenges for the US military PSYOP community during a transitional period.¹

A broad definition of psychological operations details the planned use of communications to influence human attitudes and behavior. They consist of political, military, and ideological actions conducted on target groups to create desired behavior, emotions, and attitudes. If used properly, PSYOP will precede, accompany, and follow all applications of force. The military should carry out this course of action under the broader umbrella of national policy. In addition, it should coordinate fully and carefully the military component of the overall PSYOP effort with other agencies of government.

More specifically, PSYOP can demoralize, disorient, and confuse hostile groups. Against such groups, psychological operations are employed as offensive weapons to enhance the overall effectiveness of military operations. They also can unite, inform, and bolster the morale of nonhostile groups. When targeting neutral or friendly groups, they are used to support military objectives by developing cooperative attitudes and behavior in the targeted group.

Evolution of US Military Psychological Operations

The level of interest in military psychological operations during this century has been episodic, basically rising and falling during and after the major conflicts in which US forces have been committed. Over this period, most of the activity in military PSYOP centered on the Army. The following brief historical perspective, therefore, focuses on the Army's experience to illustrate the fortunes of military PSYOP.

While giving psychological warfare (psywar) only token recognition' in World War I, the Army established both the Psychological Warfare Subsection of G-2 in the War Department and the Propaganda Section of G-2 in General Headquarters, American Expeditionary Forces. Military tactical psychological warfare centered on the production of leaflets; radios did not exist as a means of communication, and loudspeakers were primitive. Military propaganda concentrated on producing surrender appeals; balloons and airplanes were the primary method for their dissemination.

From 1918 to 1941, no psychological warfare office existed in the War Department. The lessons of experience were lost, and by 1941 only one officer on the War Department staff had had psychological warfare service in the previous war.

During World War II, most of the Army's operational work in psywar took place at the theater level, where the responsible organization was normally designated a psychological warfare branch (PWB). The largest of these organizations at the theater level, the PWB at Allied Forces Headquarters (PWB/AFHQ), was activated in North Africa in November 1942 at the order of Gen Dwight D. Eisenhower. It was expanded in February 1944 to the Psychological Warfare Division, Supreme Headquarters, Allied Expeditionary Force (PWD/SHAEF). Psychological warfare was defined as "the dissemination of propaganda designed to undermine the enemy's will to resist, demoralize his forces and sustain the morale of our supporters." ²

The basic Army field operating unit for psywar was the Mobile Radio Broadcasting (MRB) Company. The equipment for this company was unlike anything conventional soldiers had seen in the field: public address systems, radios,

monitoring sets, loudspeakers, typewriters, mobile printing presses, and leaflet bombs. MRB units were usually divided by the separate Army groups and field armies into small teams, often to work in direct support of frontline conventional combat units. Five such units eventually served under PWD/SHAFF. Although these units resulted from improvisation in 1943 and 1944, the doctrinal and organizational concepts they embodied reappeared in the psychological warfare units formed during the Korean conflict.

During 1945-46, Army psychological warfare staffs and units dissipated with the general demobilization of the military establishment. Despite the efforts of a few senior civilian and military officials to retain a military PSYOP capability, the Tactical Information Detachment was the only operational psychological warfare troop unit in the US Army when the North Koreans attacked South Korea in June 1950. Organized at Fort Riley, Kansas, in 1947, this detachment had been reorganized as the 1st Loudspeaker and Leaflet (L&L) Company. Sent to Korea in the fall of 1950, it served as the Eighth Army's tactical propaganda unit throughout the conflict. Tactical propaganda, sometimes called combat propaganda, was directed at a specific audience in the forward battle areas and used in support of localized operations. Mobile loudspeakers mounted on vehicles and aircraft became a primary means of conducting tactical propaganda in Korea.

To conduct full-scale strategic operations, the 1st Radio Broadcasting and Leaflet (RB&L) Group was organized at Fort Riley and shipped to Korea in July 1951. The 1st RB&L Group was specifically designed to conduct strategic propaganda in direct support of military operations. This propaganda was intended to further long-term strategic aims and was directed at enemy forces, populations, and enemy-occupied areas. The 1st RB&L Group had the equipment and capability to produce newspapers and leaflets, and to augment or replace other means of broadcasting radio propaganda. The group supervised a radio station network, known as the "Voice of the United Nations," and often produced more than 200 million leaflets a week that were disseminated by aircraft or by specially designed artillery shells. The leaflets expressed various themes. Some leaflets, for example, offered inducements for

enemy soldiers to surrender; others bolstered the morale of Korean civilians by proclaiming UN support.

Although the RB&L Group was a concept accelerated to meet the requirements of the Korean conflict, it performed functions similar to those used in psychological warfare in World War II. Its MRB Company bore a direct linkage to the mobile radio broadcasting companies formed under PWD/SHAEF to conduct operations in North Africa and the European theater during 1944-45. However, the MRB companies were organized during World War II to perform tactical psywar; radio later became an essentially strategic weapon that had no place in a purely tactical psychological unit. The strategic concept embodied in the RB&L Group was destined to figure prominently in the psywar capability that was subsequently formed as part of the Psychological Warfare Center in 1952. The tactical idea expressed by the L&L Company also influenced the capability that was developed there. As originally established at Fort Bragg, North Carolina, the Psychological Warfare Center consisted of a psychological warfare school, the 6th Radio and Broadcasting Group, a psychological warfare board, and the 10th Special Forces Group. The mission of this unprecedented center:

To conduct individual training and supervise unit training in Psychological Warfare and Special Forces Operations; to develop and test Psychological Warfare and Special Forces doctrine, procedures, tactics, and techniques; to test and evaluate equipment employed in Psychological Warfare and Special Forces Operations.³

After an initial burst of activity fueled by the Korean conflict and by fears of a possible outbreak of war in Europe, interest in the Psychological Warfare Center began to dissipate. Its title was changed to the Special Warfare Center in 1956, but the Army's psychological operations capability had eroded by the early 1960s.

Consequently, an insufficient base of PSYOP-trained officers were available when the 6th Psychological Operations Battalion was activated in Vietnam in 1965. By 1967, the Army's PSYOP forces in Vietnam had been expanded to a group (the 4th) with four battalions, one in each of the four corps tactical zones (CTZ). The group served under the commander, US Military Assistance Command, Vietnam, with the J-3's Psychological Operations Division exercising direct

staff supervision. The Joint US Public Affairs Office (JUSPAO) provided US PSYOP policy guidance not only to the civilian agencies but also to all military PSYOP elements.

In addition to providing tactical support to field force commanders, the 4th Psychological Operations Group assisted the South Vietnamese government in its communication effort down to the hamlet level. The group headquarters operated a 50,000-watt radio station and high-speed heavy printing presses, published a magazine for Vietnamese employees working for US government and civilian agencies, and could research and develop propaganda materials.

In contrast, PSYOP battalions had light printing presses, a research and propaganda development capability, personnel to work with the US Air Force Special Operations units for aerial leaflet and loudspeaker missions, and ground loudspeaker and audiovisual teams. Loudspeaker and audiovisual teams operated with US divisions and brigades or with province advisory teams. The 7th Psychological Operations Group in Okinawa provided valuable backup support in printing and in disseminating leaflets at high altitudes.

During the height of US involvement in Southeast Asia, the Army stationed PSYOP units at Fort Bragg and in Germany, Panama, and Okinawa. These units were established in addition to the 4th Psychological Operations Group in the Republic of Vietnam. By the mid-1970s, however, all that remained in the active component was an inadequately staffed and antiquatedly equipped group at Fort Bragg-a condition that did not improve significantly for 10 years.

Revitalization of PSYOP in the 1980s

The 1980s saw an upturn in the fortunes of military PSYOP, made possible by several conditions. President Ronald Reagan, who assumed office with a strong anticommunist orientation, characterized the Soviet Union as the "evil empire" early in his tenure. He directed that a program be developed to support noncommunist insurgencies (the "Reagan Doctrine") around the world. With public opinion supporting him, President Reagan embarked upon a large buildup of the US defense establishment-a buildup that benefited military PSYOP.

The president then outlined, in a number of national security directives, his approach to the psychological dimension of national power. His initial national security strategy, announced in the summer of 1981, contained four basic components: diplomatic, economic, military, and informational. This emphasis on the psychological component was retained in subsequent Reagan national security strategies.

In January 1983⁺ President Reagan signed National Security Decision 77, "Management of Public Diplomacy Relative to National Security." This directive defined public diplomacy rather broadly, stating that it "is comprised of those actions of the U.S. Government designed to generate support for our national security objectives." The term generally evolved to embrace a broad range of informational and cultural activities. The decision also established an interagency mechanism to plan and coordinate public affairs, information, political, and broadcasting activities of the US government.

In early 1984, the president directed DOD to rebuild its military PSYOP capabilities. In response to this directive, Secretary of Defense Caspar Weinberger launched a major evaluation of the department's capabilities and needs in psychological operations. This evaluation concluded that DOD's PSYOP capabilities had been allowed to atrophy over the previous decade. Across-the-board deficiencies had developed in policy guidance, roles and missions, doctrine, organization, force structure, operational concepts, planning, programming, training, logistics, intelligence support, readiness, personnel programs, and-most importantly-attitude, underscoring the need for education and heightened awareness at all levels of military and civilian organizations.

DOD PSYOP Master Plan of 1985

Secretary Weinberger elected to use a DOD PSYOP master plan as the framework for rebuilding military PSYOP capabilities. Approved in mid-1985, the plan served as a comprehensive design for the fundamental improvement of the department's capabilities to effectively perform worldwide psychological operations in support of national objectives in peace and crisis and at all levels of conflict.

The plan specified a number of remedial actions-over 200, in fact-to be implemented over several years. Several essential themes manifested themselves.

The first theme highlighted the need to develop a comprehensive joint doctrine for the formulation, direction, coordination, and conduct of PSYOP in peace, crisis, and war. In effect, this doctrine provided a foundation for the revitalization effort. Among other things, it sought to enunciate the function of PSYOP as a force multiplier in all military activity, establish the conceptual framework for planning and implementation, and delineate roles and responsibilities of the several components. The Joint Chiefs of Staff (JCS) published this doctrine in 1987. It was later revised to reflect US experience with PSYOP in support of military operations in Panama and the Persian Gulf.

The development of doctrine was to be paralleled by major improvements in PSYOP planning, the second theme of the 1985 Master Plan. It devoted insufficient human talent to full-time, meaningful, sustained PSYOP planning at appropriate staff levels. The report card on this major deficiency offers mixed reviews, but some evidence of progress exists. Creation of a small psychological operations directorate, the first such office to exist in the Office of the Secretary of Defense (OSD) in over 20 years, indicated the seriousness with which Secretary Weinberger undertook the revitalization effort. The PSYOP staff element in the Office of the Joint Chiefs of Staff (OJCS) was upgraded from a branch to a division. It also showed an increase in personnel, but later reverted to a branch and lost a few personnel spaces. The Department of the Army staff created a psychological operations and civil affairs division, where before only one full-time officer had been assigned to this activity.

Outside the Pentagon, a few changes occurred. Among the unified commands, United States Southern Command (USSOUTHCOM) created a PSYOP detachment to augment its staff capability. The US Special Operations Command (USSOCOM) was established in 1987 at MacDill Air Force Base, Florida. Included in this unified command staff was a directorate for psychological operations and civil affairs (J-9). More recently, in 1990, the Army created the Civil Affairs and Psychological Operations Command at Fort Bragg. Commanded by a USAR

brigadier general and staffed primarily by reserve component personnel on varying periods of active duty, this headquarters of 146 personnel (later reduced to 80) serves all active and reserve component Army civil affairs and psychological operations units. This new organization reports to the US Army Special Operations Command (USASOC) at Fort Bragg.

Much more remains to be done in this area, however. Perhaps the key requirement is that staff officers receive formal training in this specialized area and that psychological operations become an integral part of the operational course of action in any plan. A few innovative and resourceful staff officers can make a vast difference if they have access to a command's major planning activities. Because of the paucity of trained PSYOP staff officers in major commands, the burden for planning too often falls upon the Army's 4th Psychological Operations Group, the only active duty unit of its type among the services.

Development of adequate numbers of PSYOP planners is where the Air Force, Navy, and Marine Corps can make an important contribution to the revitalization envisaged in the 1985 Master Plan. The conduct of psychological operations is not the exclusive domain of such specialized units as those in the Army. In the current resource-constrained environment, only a small possibility exists that the other services will opt to field new PSYOP units. On the other hand, there is every reason to expect those services to develop fully qualified PSYOP planners to meet their own needs and to provide their proportionate share on joint staffs.

To help address this need and in response to the 1985 Master Plan, the Army's John F. Kennedy Special Warfare Center and School at Fort Bragg developed a joint PSYOP staff planning course in 1988. A large proportion of its students have been from the Army's reserve component PSYOP community. Too few representatives from the other services have participated, and it is uncertain how many of them actually were assigned to staff positions where their expertise could be utilized. Reportedly, the Army plans to eliminate the course in 1996. If it does, this will be unfortunate-it is the only formal joint PSYOP planning course currently available. What is needed instead is a renewed and continuous emphasis that would enable the course to fulfill its original purpose. This

will not happen, however, until the services begin to send more officers to the course and ensure their assignment to positions where their training can be utilized.

Closely related was the need to educate our officer corps on psychological operations, the third theme. As indicated earlier, the 1985 Master Plan stated that the root cause of the atrophy of our military PSYOP capabilities was a lack of understanding of psychological operations, their value, and their application. Some improvement was made in this critical area as a result of frequent briefings to senior commanders and staff officers by PSYOP personnel, the professionalism of PSYOP units in contingency planning and in support of conventional forces on joint training exercises, and the steady improvement of PSYOP studies and assessments in support of the unified commands and national level agencies. Certainly, the credible performance of PSYOP forces during combat operations in Panama and the Persian Gulf also played a key role in this regard.

Additionally, the PSYOP courses being presented by both the Air Force and the Army help to address the deficiencies in this area of PSYOP awareness and understanding. The Air Force's Joint Senior Psychological Operations Course, held four times a year by their Special Operations School at Hurlburt Field, Florida, provides selected senior officers and civilians with an awareness of how psychological operations can support national objectives throughout the spectrum of conflict. This course initially showed considerable promise as an educational tool, but it attracts too many personnel whose duties have little relationship with psychological operations. Again, this situation requires renewed and continuous emphasis to interested senior officials in key positions. Unfortunately, these personnel too often find it difficult to fit a three-or four-day course away from the office into their busy schedules. A shorter orientation-perhaps four hours, presented by a traveling team-should be considered as an addition to the present course.

As was the case before the Vietnam War, the 1985 Master Plan stated that PSYOP instruction in our mainstream service school system-where our future commanders and staff officers are trained-was limited or nonexistent. This situation not only made more difficult the PSYOP community's job of educating supported units on this unique weapons system-it

also had a negative effect when priorities concerning force modernization were being set.

To address this loss of PSYOP institutional memory, the under secretary of defense for policy, Dr Fred Ikle, sent letters in 1986 and 1987 emphasizing the secretary of defense's intention to revitalize our military PSYOP capabilities and offering an OSD presentation on psychological operations to commandants of the colleges and the command and staff colleges. The intent was to stimulate interest in a more extensive treatment of PSYOP in service school curricula. The military services were asked to review all levels of their professional military education (PME) curricula, both officer and enlisted, and to develop new educational goals that would upgrade their psychological operations PME. As a second part of this approach, OSD initiated a contract to develop applicable PSYOP curriculum materials for the services.

These materials were in fact provided to the services, but there is little evidence to suggest that the services integrated PSYOP into the curricula of their schools. Nor have great speakers made presentations on PSYOP to service schools in a coherent and consistent manner (some presentations are made in electives). Institutionalization of PSYOP understanding will not occur until service schools have removed this deficiency.

The fourth broad theme in the 1985 Master Plan encompassed the need to modernize our PSYOP force structure in terms of both personnel and equipment. With the exception of an increase of the 4th Psychological Operations Group's strength, the force structure today is essentially the same as in 1985. The Navy has an excellent radio and television capability in its reserves and a 10-kilowatt (kW) mobile radio transmitter that is assigned to its Tactical Deception Group (Atlantic), both of which can be used to support PSYOP activities. The Air Force has a National Guard squadron of specially fitted C-130 aircraft for radio and television support of PSYOP along with other duties. Also, a handful of Air Force officers with PSYOP expertise are serving in key positions in the Pentagon, among the unified commands, and at their Special Operations School at Hurlburt Field. The Marine Corps has two civil affairs groups with PSYOP as a secondary

mission in its reserves. Only the Army has active duty forces dedicated solely to psychological operations.

The 4th Psychological Operations Group at Fort Bragg is all that remains of the Army's active PSYOP capability. Assigned to the US Army Civil Affairs and Psychological Operations Command, and to a part of the US Army Special Operations Command, the 4th Group has many worldwide missions and responsibilities. The 4th provides support to all levels of DOD, from unified command through division. It supports both conventional forces and special operations forces. In addition, it is often nailed upon to provide support to national level agencies and organizations. If any one military unit can be adjudged a "national asset," surely the 4th Psychological Operations Group fits the requirements.

Essentially, a military PSYOP unit engages in two broad activities: (1) research/ analysis and (2) operations. The first activity consists of continually monitoring and assessing psychological environments in specific foreign nations to determine how those situations affect the formulation and execution of US policies and actions. This research and analysis results in published studies and assessments that are unique; they provide the foundation for establishing psychological objectives that support US goals related to foreign nations or groups. Research and analysis is therefore essential to accomplishment of the second broad activity: planning and executing PSYOP campaigns that employ communications media and other techniques designed to cause selected foreign groups and individuals to support US national and military objectives.

In peacetime, a military PSYOP unit conducts research and analysis of specific geographic regions and target audiences, develops PSYOP plans to support conventional and special operations units, and participates in field exercises that employ these plans. Because of the paucity of PSYOP expertise at unified commands, the 4th Psychological Operations Group provides staff assistance and advice to headquarters and to other major commands.

It should be eminently clear from the foregoing that one active duty PSYOP organization cannot support all unified command requirements for mid- or high-level intensity

conflicts. The reserves are, therefore, a vital component of the "PSYOP community," since 73 percent of the Army's PSYOP mobilization capability lies in its reserve component units. Serving as the Army's planning agent to align the AC and RC units program (CAPSTONE, which links reserve units with the units they would support upon mobilization), the Civil Affairs and Psychological Operations Command (USACAPOC) provides training assistance to, and coordinates the contingency planning efforts of, reserve units. The 4th Group assists USACAPOC in this effort.

Generally speaking, then, USACAPOC and the 4th Psychological Operations Group act as a "strategic nucleus" for the PSYOP community; they provide the bulk of peacetime and low-intensity conflict requirements, give direction and guidance to the PSYOP community for contingency planning and participation in peacetime exercises, and serve as the command and control nucleus for generally or partially mobilizing reserve component forces. The reserve component performs its planning and training responsibilities under the CAPSTONE program and prepares for general or partial mobilization in support of the unified commands.

Paradoxically, the successful CAPSTONE program underscores one of the PSYOP community's most glaring weaknesses: its limited capability to respond to peacetime and low-intensity conflict requirements. While mid- and high-intensity conflict requires either partial or general mobilization of the reserve component, the active component must provide most PSYOP activities during peacetime and at the lower end of the conflict spectrum.

As a result of initiatives undertaken in the early_ 1980s, the Army increased the strength of the 4th Group by 500 personnel, roughly doubling its size by the mid- to late 1980s. The 1985 DOD PSYOP Master Plan provided additional impetus for this increase. The reserve component PSYOP structure has remained relatively stable in recent years, with a little over 3,000 personnel.

In terms of personnel quality, the Army's military occupational specialty (MOS) for PSYOP enlisted personnel was a welcome accomplishment. Reports of the high quality of personnel being trained under this specialty have been encouraging.

Less encouraging was the Army's decision in the mid-1980s to remove its officer **PSYOP** and civil affairs MOS from the foreign area officer (FAO) specialty. The change was disturbing because it separated psychological operations from the specialty that had provided its intellectual lifeblood. The core of the area expertise (knowledge of foreign cultures) and the analytic capability of psychological operations fell within the FAO specialty.

The Army's initial decision included both **PSYOP** and civil affairs in the special operations functional area. Subsequently, however, the Army developed separate functional areas for **PSYOP** (FA 3913) and civil affairs (FA 39C). It remains to be seen whether this decision will provide the quality officers that previously had been produced by the FAO program.

With respect to the modernization of psychological operations equipment, the progress has been more positive. Several Army initiatives in the early and mid-1980s upgraded active and reserve component print, radio, loudspeaker, and audiovisual capabilities. The 4th Group's media production center, built in the mid-1980s, represented a quantum leap in the military's **PSYOP** capability to operate in a modern audiovisual environment. Similarly, the Air Force allocated funds to modernize its National Guard aircraft dedicated to support **PSYOP**.

Nevertheless, modernization of **PSYOP**-unique equipment requires continued emphasis. For example, with one exception, the old, relatively immobile 50,000 kW radios (the TRT-22s) in the **PSYOP** community have not been replaced. **PSYOP** loudspeakers once again need upgrading, and the Air Force needs a device that can rapidly release leaflets in high-altitude operations.

Two of the most controversial themes of the 1985 DOD **PSYOP** Master Plan were the organizational separation of psychological operations from special operations and its corollary, creation of a joint psychological operations center. Indeed, these were the only truly revolutionary initiatives in the original plan-and both failed.

The authors of the 1985 Master Plan believed that, in general, the subordination of psychological operations to special operations detracted from recognition of the overall applicability of **PSYOP** in times of peace, crisis, and war. The

1985 Master Plan, therefore, called for separating psychological operations from special operations throughout DOD, including departmental levels and all headquarters and staffs of the JCS, the services, the unified and specified commands, and the component and subordinate commands. The plan outlined several reasons for separating PSYOP from special operations.

Planning, particularly in the unified and specified commands, suffered because the sole PSYOP planner was usually located in the special operations staff element and was employed only part-time in psychological operations. This subordination detracted from the broader responsibility of planning psychological operations support for the theater's total requirements, particularly in those missions that link military psychological operations and national objectives, policy, and strategy, and that require in-theater interagency cooperation.

Further, the subordination of psychological operations units to the special operations field, including its command and control structure, contributed to the lack of understanding of PSYOP, its uses and capabilities, by military officers and senior civilians. This association and subordination caused many in the field to conclude that psychological operations were focused primarily in support of special operations missions.

While PSYOP does have a mission in support of special operations, it also has a much broader application in peacetime and in crisis-with or without accompanying military operations-and across the entire spectrum of conflict. In the 1980s, only 10 percent of the Army's psychological operations forces-active and reserve-were designated by contingency plans to support special operations units in wartime.

Similarly, the argument for separation of PSYOP from special operations was implicit in the Army's and JCS's arrangements for wartime command and control of psychological operations. In wartime, most of the PSYOP forces are aligned (within the unified commands) with a chain of command that is totally separate from that of special operations forces. PSYOP units are combat support forces and are employed at both strategic and tactical levels from the theater to the division as a matter of routine; special operations forces are employed primarily as strategic assets only on an exceptional basis.

Because of its controversial nature, the separation directed by the 1985 Master Plan was slow in implementation. To be sure, some important initial steps were taken. A new OSD psychological operations directorate established in January 1986 was assigned to the principal deputy under secretary of defense for policy and was separated from special operations in terms of overall policy responsibilities. On the joint staff, PSYOP was removed from the Joint Special Operations Agency and placed under the J-3. An important precedent was established on the Department of the Army staff when a separate PSYOP and civil affairs division was created; and two unified commands—USSOUTHCOM and USCENTCOM—effected the separation (PSYOP from special operations) within their staffs.

But for the large part, separation did not take place among the unified commands, subordinate service headquarters, or at the operational level. The Army, for example, took the position that separation applied only to staff levels, not forces. A major reason for the delay, of course, was the uncertainty resulting from the congressionally mandated reorganization of special operations forces. This subject will be discussed later in more detail. Suffice it to say at this point that full separation did not occur.

The separation issue was closely related to the final major theme of the original master plan: creation of a joint psychological operations center. According to the master plan, psychological operations was sufficiently important to warrant the creation of a separate center dedicated to the long-term development and nurturing of this unique capability. This center eventually became the organizational and intellectual font of PSYOP within the Department of Defense.

The responsibilities for the center envisaged in the 1985 Master Plan included long-range strategic psychological operations plans; continuing education and training of personnel research and analytical studies; and development of equipment. The center was also to assist OJCS and OSD to develop, plan, and coordinate the defense portion of inter-agency activities, and to assist the unified and specified commands in their planning of psychological operations. To best accomplish these tasks, the plan favored the Washington, D.C. area for the center's location.

The joint psychological operations center was to consist of two separate but mutually supporting elements, one operational and the other developmental, each indispensable to the other. These elements were to have been the 4th Psychological Operations Group along with PSYOP spaces in the Army's John F. Kennedy Special Warfare Center and School. This concept would have used existing PSYOP units and personnel spaces to provide the nucleus of initial manpower requirements.

The plan indicated that initially the center probably would be under Army management because the other services had few personnel to contribute. However, as representation from the other services increased to more than token level, the joint character of the center was to be emphasized by making its command rotational among the services. As with the separation theme, however, the joint psychological operations center envisaged by the original plan met with fierce resistance, particularly from the Army-which, of course, would have been the most heavily affected by the initiative.

Implementation of both initiatives-the separation of PSYOP from special operations and the creation of a joint psychological operations center-became, in effect, hostage to the resolution of several issues that resulted from the congressionally mandated reorganization of special operations forces. In October 1986, Congress passed a special operations force (SOF) reform package sponsored by Senators William Cohen (R.-Maine) and Sam Nunn (D.-Ga.). The law created a unified SOF command under a four-star general or flag officer, an assistant secretary of defense for special operations and low-intensity conflict, and a board for low-intensity conflict within the National Security Council (NSC). It recommended the appointment of a deputy assistant to the president for low-intensity conflict. Particularly important, it directed the secretary of defense to create a major force program category for DOD's five-year defense plan for special operations forces.

After passage of this legislation, a major question arose on whether to include PSYOP and civil affairs units in the assignment of forces to the new USSOCOM. Good arguments were presented on both sides of this issue. Two of the major advantages advanced for inclusion were that these forces would benefit from the sponsorship of a unified commander

and participation in the major force program for SOF. But the secretary of defense's previous guidance to separate PSYOP from special operations-as part of his decision concerning implementation of the 1985 DOD Psychological Operations Master Plan-had to be considered. After a lengthy review of this issue, Secretary Weinberger decided to assign Army and Air Force active and reserve component psychological operations and civil affairs units to USSOCOM, effective 15 October 1987.

Secretary Weinberger's decision, of course, sealed the fate of the two most controversial and far-reaching initiatives of the original plan: separation of PSYOP from special operations and creation of a joint PSYOP center. Separation at the operational level had never taken place, since the Army's PSYOP forces remained under their special operations command at Fort Bragg. And separation at the staff level-which had seen some initial progress, at least in the Pentagon-would inevitably fail as well. On the joint staff, PSYOP was transferred back to special operations. And in May 1992, overall policy responsibility for PSYOP in OSD was moved to the Office of the Assistant Secretary of Defense (OASD) for Special Operations and Low-Intensity Conflict.

The secretary's decision also made moot the creation of a joint PSYOP center, as originally conceived in the 1985 Master Plan. The forces and personnel spaces scheduled for the nucleus of this project remained under the Army's special operations command and as part of USSOCOM. Even the creation of a much smaller version of the joint PSYOP center-located in the Washington, D.C. area and concentrating primarily on strategic PSYOP-has become unlikely in the current environment.

A candid assessment of the 1985 plan, therefore, provides mixed reviews. The most significant initiatives on increasing the strength of the 4th Psychological Operations Group-establishing an enlisted PSYOP MOS, modernizing PSYOP-unique equipment for both active and reserve component units, and undertaking detailed PSYOP contingency planning in support of the unified commands-were all undertaken by the Army in the early 1980s, prior to the 1985 plan. To be sure, the plan provided additional emphasis to help bring these initiatives to fruition, but the initial impetus came from

the Army. Improvements undoubtedly occurred in the formulation of joint doctrine, indoctrination of the officer corps, and staff planning, but these areas still require attention. And the two truly revolutionary themes of the original master plan—separation of PSYOP from special operations and creation of a joint PSYOP center—did not become a reality. In the final analysis, perhaps the greatest benefit to the PSYOP community was the morale-enhancing evidence of senior-level interest, due in large part to the dedication of the late Gen Richard G. Stilwell, USA, Retired, who spearheaded the 1985 plan while serving as the deputy under secretary of defense for policy.

Nevertheless, while the plan's ambitious goals were not fully realized, the revitalization efforts of the 1980s made possible the highly credible performance of PSYOP forces in Panama (Operations *Just Cause* and *Promote Liberty*) and the Persian Gulf (Operations *Desert Shield* and *Desert Storm*). The early integration of PSYOP into military planning for these operations—heretofore all too often a serious deficiency—contributed significantly to its successful utilization. In both contingencies, PSYOP forces employed a wide range of media, including loudspeaker broadcasts, radio transmissions, posters, and leaflets. Principal PSYOP objectives were to (1) cause the enemy to cease resistance and surrender, (2) solicit information and the turn-in of weapons, (3) inform civilians and keep them out of the battle areas, (4) establish a favorable image of friendly forces, (5) deflect hostile propaganda, and (6) support civil affairs units in emergency relief and consolidation activities. Overall, the goal was to enhance combat operations and reduce casualties on both sides. Successful accomplishment of this goal would have been doubtful without the increased personnel strength of the 4th Psychological Operations Group and the modernization of equipment for both active and reserve component PSYOP units brought about by revitalization.⁴

Thus, the revitalization of military PSYOP capabilities that took place during the 1980s was fueled by a presidentially inspired public perception of the common threat (i.e., the Soviet Union), a "defense consensus" which enabled massive increases in military budgets, several key Reagan administration national security directives that provided impetus for DOD, and the "top-down" emphasis of Secretary Weinberger

and a few key advisors which resulted in the 1985 DOD PSYOP Master Plan.

The Changing International and Domestic Environment

A comparison of these earlier conditions with the present environment provides some rather stark contrasts. The most dramatic change has occurred in the American public's perception of the threat.

An important stimulus for this change in attitude was the emergence of Mikhail Gorbachev as Soviet leader in 1985. His domestic political and economic reforms, the withdrawal of troops from Afghanistan, the cessation of "Voice of America" jamming, his announced intention to reduce Soviet military forces by 500,000 men and cut their budget by 14.2 percent, and the intermediate nuclear forces arms control agreement were just some of the actions that helped to lessen international tensions. Polling data of US public attitudes depicted a startling change in just over a two-year period; by July 1988, 94 percent of voters believed that US-USSR relations were stable or getting better. Mr Gorbachev's policies led Margaret Thatcher to conclude in November 1988 that the cold war had come to an end.

If onlookers thought Thatcher's conclusion a bit premature, they should consider that the subsequent years have been truly mind-boggling. The dissolution of the Warsaw Pact and the liberation of Eastern Europe, the reunification of Germany and its emergence as a major power, and the disintegration of the former Soviet Union have been revolutionary geopolitical changes that few could have foreseen. Russian Republic President Boris Yeltsin's signing of a historic strategic arms control agreement with President George Bush in June 1992 is only the most recent indicator that the cold war as we knew it has, in fact, ended.

During the same period that these momentous events have occurred in the international arena, Americans have become more preoccupied with domestic concerns. A lingering economic recession and high jobless rate, concerns over the burgeoning federal budget deficit, and deep-rooted problems of

the cities (as vividly seen in the Los Angeles riots) have taken their toll. In February 1992, the conference board's measure of consumer confidence registered its lowest level in 17 years; and in April, four-fifths of Americans surveyed said they believed the country was seriously on the wrong track.⁵ These domestic anxieties, coupled with the absence of a clearly discernible external threat, have led to growing pressures for steeper cuts in the defense budget and in foreign aid. The "defense consensus" of public and congressional support during the early Reagan administration has disappeared.

Thus, the context within which defense planning takes place is in transition, as William Hyland, editor of *Foreign Affairs*, reminds us:

This time the cliché is true: this is a new era, but we are only in the opening phases. It is fruitless to search for a politically correct concept of the national interest to justify American foreign policy. Debating in these categories is itself an intellectual hangover from the Cold War. . . . The US defense posture is only in the preliminary stages of the restructuring that will follow the end of the Soviet threat.⁶

Challenges for Future US Military Psychological Operations

The challenges for military psychological operations are formidable. To be sure, inclusion of PSYOP forces in USSOCOM provides some assistance in meeting these challenges: a four-star proponent (the commander, USSOCOM) and, ostensibly, full participation in the major force program (MFP-11) for SOF. The clout of an assistant secretary of defense (ASD/SOLIC) also should benefit psychological operations at the policy level.

Nevertheless, three broad areas must be addressed if the PSYOP community is to emerge from this period of transition to play a viable role in our nation's security: (1) education of senior civilian and military officials on the value of the psychological dimension; (2) planning for the use of military PSYOP in a changing world; and (3) continued modernization of the PSYOP force structure.

Planning should begin now to ensure that the psychological dimension receives appropriate attention by the new administration-and OASD/SOLIC should play a leading role.

Unfortunately, a loss of momentum has occurred in this area. The national security strategy statements of President Bush (March 1990 and August 1991) placed a much less explicit emphasis on the informational element of national power than did those of Ronald Reagan. The Reagan administration directives that created interagency public diplomacy mechanisms, and that played a vital role in revitalizing DOD's psychological operations, have lain dormant. The NSC has paid little attention to this area.

A review of our national security strategy suggests that OSD, OJCS, and USSOCOM must continue to coordinate their efforts to have psychological operations considered by the NSC. DOY must intensify its efforts to educate new players on the NSC staff and to build allies among the key agencies in order to resuscitate existing national security directives-or create new ones-that provide guidance to psychological operations and public diplomacy activities. To address a long-standing deficiency, DOD sorely needs a senior-level NSC mechanism to integrate and direct the information and psychological operations activities of the various agencies. Such a forum also would provide a vehicle to overcome the differences in operational terminology that have plagued past efforts to integrate interagency planning in these areas.

To meet its needs in a changing world, DOD should undertake once again to update its bilateral agreements with the United States Information Agency (USIA), the Board for International Broadcasting, and the Central Intelligence Agency (CIA). With diminishing budgets almost a certainty, it will behoove these agencies to pool their resources and accomplish common goals in the psychological dimension.

Another major task facing PSYOP advocates after every election is that of educating the new players in DOD. This process should begin after a major turnover of senior civilian officials has taken place. A good vehicle to accomplish this is the DOD PSYOP Master Plan. Inclusion of key advisors in the final staffing of the document would provide an opportunity for them to educate themselves on psychological operations. There is some symbolic value attached to having the secretary of defense sign the master plan: It provides visible evidence of top-down emphasis.

Similarly, a number of DOD directives affecting military psychological operations need to be modified and revalidated. Involving key civilian players in this process would provide an excellent opportunity to educate them about PSYOP. The same holds true for staffing the defense planning guidance and the national military strategy, both of which should follow publication of the president's national security strategy. Indeed, the current national military strategy, published in January 1992, contains no mention of the psychological dimension.

Renewed efforts must be made to indoctrinate the mainstream of the officer corps on psychological operations. High-level emphasis, continuously applied, will be necessary to remedy the long-standing absence of PSYOP instruction in most of PME. Until this is done, OSD, JCS, and USSOCOM should coordinate their efforts and provide annual presentations to the senior service schools and the command and staff colleges. Formation of a traveling team to provide instruction on PSYOP to major commands should be considered. Examples of the successful use of psychological operations in Grenada, Panama, and the Persian Gulf would enhance the learning experience for commanders and staff officers. PSYOP should be integrated into computer-assisted war games and simulations. High-quality articles on psychological operations in professional military journals would help to publicize the successful use of this valuable force-multiplier. Institutionalization of military PSYOP will take root only when commanders are convinced that it is indispensable to combat effectiveness.

This education process must continue with planning for the utilization of military psychological operations. This will be a critical task during a period in which there is no apparent clear consensus about either US national security interests or the military's post-cold-war missions. Consider these words of Paul Hammond:

Where strategy used to be something that we could think of as a plan to be executed, now it must be increasingly a set of capabilities for dealing with contingencies. Where strategy once was a matter of inventing the future, now it is increasingly a matter of adapting to it. ⁷

This, of course, is what our present National Security Strategy and National Military Strategy attempt to provide: a broad focus, regionally oriented, and a "base force" to deal with an uncertain and rapidly changing world.

Within this context, military PSYOP advocates must demonstrate the applicability of psychological operations in all environments: support of conventional forces, low-intensity conflict, and special operations forces. Similarly, military PSYOP can play a valuable supporting role in the peacetime activities of the CINCs and other government agencies, such as the USIA and CIA.

First priority, however, must go to planning military PSYOP that will assist the unified commands-the combatant commands-and the conventional forces assigned to support them for various contingencies. As the military services reduce in size and units are withdrawn from Europe, a major realignment of Army PSYOP forces to other unified commands will take place. The CAPSTONE program provides an excellent vehicle to link these forces to the combatant commands for planning and participation in exercises. As the unified commands identify their priorities for contingency planning-a process of "emerging missions" that is likely to go on for some time-the PSYOP community must be alert to offer their services early on. In many cases, existing regional analytical studies will require revision, or the development of new ones, to provide the foundation for detailed PSYOP planning. Finally, supporting PSYOP plans should anticipate the new contingency plans of the unified commands and their assigned forces.

In addition to planning for mid- or high-intensity conflicts, the PSYOP community must plan for, and be prepared to participate in, peacetime and low-intensity conflict requirements. These requirements may include humanitarian assistance, peacekeeping, disaster relief, counterdrug operations, civic action, unscheduled studies and assessments oriented to crisis areas, advisory mobile training teams for the military forces of friendly nations, staff assistance to unified commands, counterterrorism, foreign internal defense, and support for DOD and non-DOD agencies. PSYOP forces-indeed, all special operations forces-provide versatile capabilities for

the National Command Authority to consider in the uncertain future environment.\$

Closely related is this major challenge: to continue modernization of the PSYOP force structure in terms of both personnel and equipment. For the PSYOP community, the corollary to Army Chief of Staff Gordon Sullivan's oft-quoted "no more Task Force Smiths" is "no more Tactical Information Detachments" (the only operational psychological warfare troop unit in the US Army when the Korean War erupted in June 1950; it consisted of two officers and approximately 20 enlisted men). In the face of continued pressures to reduce even more the size of the military, strenuous efforts must be made to avoid the fate experienced by the PSYOP community after every major conflict in this century. As recently as the early 1980s, the 4th Psychological Operations Group consistently reported the lowest readiness ratings in both personnel and equipment-and many reserve component units lacked items vital to mission accomplishment, including loudspeakers. This oversight must not recur.

In particular, the modest-but crucial-gains in personnel strength by the 4th Group during the revitalization of the 1980s must be preserved; the bulk of requirements for support of peacetime activities and low-intensity conflict will necessarily fall upon the active component. Over the long term, the key to military PSYOP viability will be the health of the Army's functional area for psychological operations (FA 39B). Continued high-level emphasis is needed to attract quality officers for this specialty, to provide them with excellent training, and to offer sufficient field grade billets for their utilization and career advancement.

The modernization of PSYOP-unique equipment undertaken in the 1980s, while beneficial, still has not been completed. The replacement for the TRT-22 radio, in particular, needs to be fielded. New loudspeakers are needed. Modernization, however, should be an ongoing process; emphasis needs to be placed on developing more mobile equipment for the future.

Being assigned to USSOCOM should help the PSYOP community in its perennial battle to obtain a proportionate share of dwindling resources or, put another way, to ensure that they do not suffer a disproportionate share of reductions.

However, a speedy resolution of whether or not military PSYOP will fully participate in MFP-11 for special operations forces is needed.

At the same time, the PSYOP community must demonstrate a fiscally responsible attitude by making maximum use of existing resources. This usage includes not only continued reliance on the reserve component for mobilization in mid-and high-intensity conflicts, but also in investigating ways in which specially trained reservists can be used to augment active component units for peacetime and low-intensity conflict requirements. Establishment of redundant capabilities should be avoided. For example, in the absence of a joint PSYOP center in the Washington, D.C., area, the 4th Psychological Operations Group's regional analysts should provide maximum support to the JCS and OSD PSYOP offices in neither of which have area experts been assigned. The use of new technologies to enhance military psychological operations capabilities without increasing personnel requirements also must be pursued. Overall, the keys will be cost-effectiveness and the utility of military PSYOP in both peace and war.

Summary

US interest in military psychological operations during this century has been episodic, basically rising and falling during and after major conflicts. The Reagan administration interrupted this pattern by providing the impetus for a revitalization of US military PSYOP during peacetime. The international and domestic conditions that made this possible have changed significantly, however, and the PSYOP community faces formidable challenges in maintaining a viable capability for an uncertain future. To address these challenges, emphasis must be placed on educating senior civilian and military officials concerning the value of psychological operations, on aggressive planning to support the emerging contingency and peacetime missions of PSYOP within the unified commands, and on continued modernization of the PSYOP force structure.

After having prevailed in the battle to gain control of military psychological operations forces and policy, the commander in chief, USSOCOM, and the assistant secretary of defense for

special operations and low-intensity conflict must play key roles in facing these challenges. For their part, the PSYOP community must demonstrate fiscal responsibility, maximum utilization of existing resources, and continued professionalism in accomplishing new missions. Working together, the goal of both the PSYOP community and its special operations leadership should be to ensure "no more Tactical Information Detachments" during this period of transition.

Blending Military and Civilian PSYOP Paradigms

Col Benjamin F. Findley, Jr., USAFR

This article compares and contrasts the concepts, philosophies, processes, strategies, and major elements of the civilian business marketing system (BMS) with the military PSYOP system. The purpose is to inform the reader of the many similarities and successful applications of proven BMS approaches, both macro and micro, and how they relate to strategic and tactical objectives in PSYOP scenarios. The goal is to improve the reader's understanding that integrating the effective practices of civilian marketing systems into the military PSYOP sector is very important. A related goal is to offer recommendations.

In a business firm, marketing generates revenues by persuading specific customers to do something. Whenever you try to persuade somebody to donate to the United Way, refrain from littering the highways, save energy, vote for your candidate, or buy your service, you are engaging in marketing. The challenge that faces the BMS is to generate those revenues and results by satisfying a targeted customer and making a profit in a socially responsible manner. Since every aspect of our lives is affected by business marketing practices, often in ways we do not even consider, we need to understand the basic principles and concepts of effective marketing. Then we need to apply them to PSYOP.

Business Marketing Philosophy

The American Marketing Association defines marketing as "the process of planning and executing the conception, pricing, promotion, and distribution of ideas, goods, and services to create exchanges that satisfy individual needs and

organizational objectives." Inherent in this definition is an exchange process where two or more parties give something of value to one another to satisfy felt needs. The marketing function, simple and direct in subsistence-level economies, is more complicated in industrial societies. Nevertheless, the basic concept of exchange is the same. To understand the BMS philosophy, we must distinguish between a sales orientation and a marketing orientation. A sales orientation assumes that customers will resist purchasing products and services not deemed essential and that the task of selling is to convince them to buy something even if they do not need it. It is a "push"; effort, focusing on selling after the product exists.

A marketing orientation is different-it begins with the customer and integrates marketing into each function of a business. Marketing will initially establish what the customer wants and needs; it should play a lead role in planning, coordinating, and directing the organization's activities. It certainly does involve selling, but only after the customer's need has been established. If the marketing job has been done well, the customer doesn't need much persuading.

Military Psychological Operations Philosophy

Military PSYOP is a specialized field of persuasive communications. It involves formulation, conceptualization, implementation, and evaluation of government-to-government and government-to-people persuasion. It is a planned use of human actions to influence the attitudes of populations that are important to national objectives. Lt Col Philip Katz, USA, Retired, emphasizes that the critical variable in military PSYOP is that of influencing the perceptions, and thereby the will, of foreign populations. PSYOP can modify the opinions, emotions, attitudes, and behaviors of a target audience. It can be directed at enemy forces to demoralize, disorient, and confuse them. It can induce defection, encourage dissident elements, and reduce combat effectiveness by adversely affecting the enemy's discipline and command and control functions. Directed toward neutral or friendly target audiences, it can be

used to unite them, boost their morale, and provide information designed to foster their understanding and cooperation.

To enhance the total opportunity for success, PSYOP must be integrated into, and considered in, all military decisions. Certainly, PSYOP planning should be concurrent with-and coordinated with-all operational planning. A few commentators imply that there is some nefarious objective and some element of deliberate misinformation involved in PSYOP. Therefore, it is important that the public understand the truth: the United States government does *not* engage in public disinformation activities!

Business Marketing Process

A company's complete marketing system consists of many processes and variables, some controllable and some uncontrollable. *Marketing mix* is the term that describes the combination of the four main controllable inputs that constitute the core of a company's marketing process: (1) the product or service, (2) the promotional activities, (3) the distribution system, and (4) the price structure. Each input has its own process, with key decisions to be made and activities to be accomplished.

The product mix involves policies, procedures, services, and activities related to the product lines to be offered, the markets to sell to, and the degree of product differentiation. The product mix also involves decisions about which product quantities to offer with which brands, in which packages, where, and when.

The promotion mix process begins with an analysis of the organization's overall mission, from which specific promotion objectives are determined. The promotion process consists of decisions and activities related to advertising, personal selling, publicity, and sales promotion. Activities include analyzing the promotion's target audience; selecting appropriate themes and symbols, following market segmentation strategies; deciding on the optimal blend of print, broadcast, and other media; setting sales quotas; conducting message pretests; and analyzing selected characteristics of the target market. Motivation, perception, attitudes, opinions, and stress are

considered. The promotion mix directly relates to the military PSYOP process and will be addressed later.

The distribution mix involves decisions about transportation, storage, and inventory. It also includes decisions about the type, quantity, and quality of wholesalers and retailers required.

The price mix includes methods for setting the right base price for a product. Discounts, allowances, markups, break-even points, and pricing strategy are elements of the price mix.

Aside from these four controllable elements in the marketing mix, the manager must be concerned with uncontrollable forces in the environment. Marketing is affected by cultural factors, laws, economic conditions, competition, technology, and demography, none of which are controllable; neither are the firm's microenvironment of suppliers, marketing intermediaries, and customers.

Military Psychological Operations Process

Psychological operations can be divided into three general categories: strategic, operational, and tactical. Strategic psychological operations are conducted to advance broad or long-term objectives designed to create a favorable global environment for military operations. Operational PSYOP seeks to achieve midterm objectives in support of regional campaigns and major theater operations. Tactical psychological operations are conducted to achieve short-term objectives against an enemy force, in direct support of tactical units. According to Field Manual 33-1, Psychological Operations, the mission of PSYOP forces is to support conventional as well as special operations forces at all levels of war and within all degrees of the conflict spectrum-low intensity, midintensity, and high intensity. Overlapping missions and objectives can blur the distinction between the categories of PSYOP.

Propaganda development for PSYOP involves a multistep process that is very similar to the promotion mix process for the BMS. Initially, the unit's mission must be analyzed so the military PSYOP mission can be derived. Information must be collected and the target must be analyzed. Just as in the business promotion process, the vulnerabilities and susceptibilities

of the target audience are key factors. Appropriate themes, symbols, and media are selected, and propaganda messages are developed and pretested. Campaign approvals are acquired, propaganda is disseminated, and the impact of the psychological objective is assessed according to specific indicators.

Just as there are strategic, operational, and tactical levels of military PSYOP, there are corresponding levels in marketing planning. Louis E. Boone and David L. Kurtz define strategic marketing planning as "the process of determining the primary (long-term) objectives of an organization and the adoption of courses of action and the allocation of resources necessary to achieve those objectives." Tactical planning in marketing focuses on the implementation of short-term plans that must be completed near-term to implement overall strategies. Boone and Kurtz emphasize the necessity of adequate resource allocation in tactical planning. Certainly, this necessity should be recognized by military PSYOP planners.

Cultural Differences

The marketing manager in business and the military PSYOP specialist must understand a variety of influences on the promotion and persuasion processes in trying to satisfy the needs and wants of the target audience. Culture is at once the most basic and the broadest environmental determinant of individual behavior. Culture is comprised of values, ideas, attitudes, and other symbols that shape human behavior. The influence of culture is difficult to define because so many crucial elements are hidden from the participants of the system itself. Cultural patterns often exist as unrecognized assumptions that are taken for granted. Culture affects how and why people live and behave as they do, which affects the target audience's susceptibility to promotional themes and their buying/ accepting behavior. America has many ethnic, religious, racial, and economic groups, each of which has its own cultural values. And each of these groups has sub-cultures with norms and values that are used to define meanings and to specify needs and wants. Thus, individuals respond uniquely to persuasive messages and appeals.

Persuasive messages in military PSYOP and in business marketing must use symbols and themes that are easily recognizable and meaningful to the culture they are trying to reach. A key persuasion guideline is that one should not substitute one's own judgment and cultural values for the values and cultural characteristics of the audience being targeted. No market has been more frustrating and difficult for American business marketers than the Japanese market. Japanese culture has produced marketing institutions and promotional relationships that differ from those found in the United States.

While leading some university students on an industrial tour of Japan in 1981, for example, I found that the food distribution system there was different from that in the United States. Japanese wholesalers, unlike their US counterparts, are specialized sellers. They do not carry a complete line of products for a select group of stores. Instead, they carry a select line of noncompetitive products that they supply to all supermarkets. Japanese wholesalers take great pride in supplying all retail stores with an exclusive but narrow product line. The goal of American wholesalers is total distribution of a complete product line to a captive set of stores; the goal of the Japanese wholesaler is distribution of a limited set of products to all retail outlets. Culture is a major influence on marketing and PSYOP.

Social Influences

The social groups to which people belong or aspire -to belong help explain why they buy certain types and brands of products, shop in one type of store and not another, accept and believe certain ideas and persuasive messages, and spend their money in certain ways. A person's social class is a major influence on his style of life and an important factor in determining his social and economic behavior. A social class is a group of people whose members are nearly alike in terms of a characteristic that is valued in their group and that clearly differentiates them from others.

PSYOP specialists and promotion managers must be aware of social class influences on the acceptance of ideas and the

willingness to behave a certain way. Different persuasive appeals, different copy, different art, and different media may be needed to promote the same product to different social classes. An upper-middle-class wife may want products, ideas, and brands that are clear symbols of her social status. She may be highly susceptible to preselling through mass media. Conversely, a lower-lower-class wife may buy largely on impulse and may be influenced by point-of-purchase promotion materials. She may not care to read much, and the broadcast media may be of great importance in communicating with her.

When social influences are combined with foreign culture influences, we see how difficult it is to understand needs and behaviors well enough to persuade an individual to accept a PSYOP message. One way to exert influence on a social class in a culture is to identify and target opinion leaders. They are chosen on the basis of expertise as well as social position. Exposure to mass media is significantly greater among opinion leaders than among nonleaders-and mass media directly influence opinion leaders. It is important to note that opinion leaders are far more effective in securing opinion changes among followers than are the mass media. Thus, it is important in PSYOP as well as in marketing to identify and aim persuasive messages directly at opinion leaders.

Family Influences

An individual is born into a family and inherits a certain social status. That status remains until he becomes an adult. Of all face-to-face groups, a person's family plays the strongest role in basic value and attitude formation.

Early family training is not cast off easily; it remains to affect one's individual values, ideas, and behaviors. Even as the adult individual strives to acquire the prestige symbols of another class, latent family influences remain to sway acceptance of ideas and products. Most buying decisions and idea acceptances are made within a framework of experience developed within the family.

Needs and Motives

Personal determinants of behavior include needs, wants, motives, and self-concepts. All of these variables combine with the previously presented interpersonal and group factors to influence one's acceptance of an idea or purchase of a product. People have a need when they lack something useful, required, or desired. When a few needs are fairly well satisfied, others emerge. Some say needs are insatiable, incapable of ever being fully satisfied; thus, PSYOP specialists and marketers do not have to satisfy one need before progressing on to other needs. Several needs at several levels can be present concurrently to influence an individual's behavior, but this approach complicates the prediction of behavior. Abraham H. Maslow proposed a hierarchy of needs that includes the most basic: physiological, safety, social, esteem; and the highest: self-actualization. Motives are inner states that direct people toward the goal of satisfying a felt need. Examples of motives include high quality, conformity, low price, performance, ease of use, long life, prestige, friendship, the opposite sex, and a desire to be different.

One's self-concept includes feelings, perceptions, and evaluations of oneself as a person. How one perceives and evaluates one's own status in relation to others in the same social class and reference groups-and to one's own levels of aspiration-are prime forces in shaping one's self-concept. The self-concept is learned; it emerges through experiences with the environment and through interactions with other people. By observing socially acceptable and unacceptable behavior and comparing one's own behavior to them, one lays the basis for one's own self-concept. The self-concept is useful in PSYOP and marketing because, through their actions and purchases of products, individuals let others know who they are and what they hope to be or to do. The purchase of goods and the expression of ideas serve as social symbols that communicate meaning. The behavior of an individual will be directed toward enhancing his self-concept through the consumption of goods and the expression of ideas as symbols, allowing a prediction of events.

Perceptions and Attitudes

Everything a person knows about the world and what it contains comes from perceptions. Perception is the reception of stimuli through the senses and the attachment of meaning to them. Sound, light, odor, taste, and pressure are received by one's sensory receptors-ears, eyes, nose, tongue, and skin. These sensations are translated into perceptions that are altered by previous learning, beliefs, values, and attitudes, and then organized into meaningful concepts. People perceive things that make sense within the context of their beliefs, values, attitudes, and experiences. Since we cannot possibly perceive all stimuli at any given time, our perceptions are highly selective and subjective; we see what we want to see and hear what we want to hear. Further, if we do not like what we perceive, we often distort or modify it.

Mass-marketing messages and PSYOP messages are based on selective perception. Because a large number of persuasive messages are directed at different target audiences, PSYOP specialists and marketers must carefully test the messages to be employed with representative targets. They must make every effort to ensure that the various target groups perceive the messages that were intended.

Attitudes are predispositions to respond in particular ways toward people, ideas, activities, or things. An attitude is not neutral; rather, it is for or against some person, object, or idea. An attitude is composed of three dimensions: cognitive (factual information), affective (feelings and emotions), and behavioral (tendencies to behave in a certain way). Attitudes affect both perception and behavior, and people resist changes in their attitudes. The more closely an attitude is related to one's self-concept, the greater will be one's resistance to changing it.

To change an attitude, a PSYOP specialist must (1) provide new information to enlarge and change the cognitive dimension; (2) attack the affective dimension of the attitude by associating the end-state of change with the desirable consequences that result; and/or (3) induce the person to engage in "attitude-discrepant" behavior (behavior that contradicts held preferences). Successful attitude-change approaches include using a trustworthy and credible source, drawing

conclusions for the target, repeating the message, and using both one-sided and two-sided messages.

Successful and Unsuccessful Business Marketing

Businesses spend several billions of dollars each year on marketing, a fact that indicates the importance they place on it. According to an *Advertising Age* article, the top 100 firms spent more than \$34 billion in 1989 for advertising. Advertising represents 'about 20 percent of total marketing expenditures. The top 10 advertisers spent more than \$10 billion for advertising alone in 1989. Those companies have been successful. Failures do occur, however. A 1988 *Advertising Age* report, for example, lists these \$100 million failures: Campbell's Red Kettle Soups, Ford's Edsel, DuPont's corfam, Hunt's flavored ketchups, and Gillette's Nine Flags Cologne.

Newspapers account for the largest annual advertising expenditure (\$31.2 million in 1988). Other 1988 expenditures: television (\$26.1), direct mail (\$21.2), radio (\$7.7), and magazines (\$6.1). Use of advertising, however, does not guarantee success even if it is planned and implemented well. A key reason is that most people do not systematically process the information they receive through the marketing message. We are largely emotional, influenced by testimonials and emotional appeals-we do not logically consider pertinent criteria when we purchase products. It seems we are more influenced by the skill, appearance, and character of the presenter than the content of the message. A 1988 *Advertising Age* survey mentioned three of the most powerful ads in US history: Volkswagen's "Lemon," Marlboro's "Country," and Coca-Cola's "Real Thing." Aside from getting commitments from dealers to carry the product, the Coca-Cola ad was successful because it capitalized on the affective domain and the unsystematic emotional responses of people. A critical conclusion for PSYOP specialists and marketers is that the ad created a psychological idea of a unique and better taste. It focused on image and emotional themes through heavy repeat advertising and readily identifiable names, symbols, and packages. It also

linked abstract, beneficial images to the physical product-the implied associations of Coca-Cola with youth and authenticity.

Business Marketing Models

Marketing lessons can be learned from business failures as well as from effective marketing models. Burger Chef did not realize that economic conditions are major factors, did not adapt to changing consumer preferences, and did not meet target market expectations. Coors did not recognize changes in the environment that necessitated adjustments in marketing strategies' and did not take the time to continue developing an image of quality and great desirability. The World Football League lost credibility by taking actions counter to prior promises and by not paying strict attention to environmental variables.

After analyzing five leading models of consumer behavior, I have blended optimal elements from each to suggest a marketing model for the buyer's decision process. The model focuses on systematic thinking and defining relevant elements for making a buying decision. It attempts to explain the progressive process that a consumer might experience in buying products or accepting ideas. PSYOP specialists and marketers can anticipate effective messages if they understand the process through which buyers can progress. They can then address those messages to bring about the desired change in behavior. My buyer decision model is like any scientific problem-solving model except that it focuses on buyer behavior. It consists of five stages: problem recognition, information gathering, alternative evaluation, the decision to buy, and postpurchase evaluation. Initially, the target consumer recognizes a problem because of inadequate supplies, changing needs, or other internal or external activities. This first stage forces buyers to succinctly state the problem based on specific unfilled needs. Then the second stage begins the planned search for specific, relevant, and identical information on all possible products. Buyers must weigh the pros and cons of the various products based on a set of criteria during this third stage. In the next stage, they make the decision that best meets their needs and wants, and that satisfies the

expectations of influencers in their social groups. The fifth and final stage is the evaluation of that decision; it should not be omitted.

Effective Objectives

Specific marketing and promotion-persuasion objectives, based on the organization's general goals, should be established. Clearly stated objectives should exist for each promotion tool so that results can be measured against them. Advertising, personal selling, publicity, and sales promotion functions should have specific expected objectives that are measurable. Print, broadcast, and audiovisual media should also have specific objectives. Marketing objectives should meet certain criteria and should be built on a solid foundation of research that reveals what the targets want to buy. The objectives should be stated in terms of target benefits-and in quantitatively measurable terms. They should help attain and reinforce the firm's overall objectives, and they should be reviewed periodically.

The Ethics of Persuading

Many critics of marketing contend that persuasion is really manipulation-or even control-of consumers, unethically coercing them into buying products they do not want. Is it immoral to arouse fears of inadequacy to sell an antiperspirant? Is it wrong to use reference-group concepts to make a product more appealing? Is it improper to design products and appeals that enhance a buyer's self-concept in order to gain a sale? Some observers argue that embellishment and distortion are legitimate and socially desirable activities and that illegitimacy enters the picture only if there is falsification with larcenous intent.

That argument notwithstanding, however, truth is the best persuasion approach; it should be the fundamental principle in both business marketing and military PSYOP. Truth, which is basic to strategic peacetime foreign policy, should be our fundamental guideline. The ultimate questions concern "What is the truth?" and "Can consumers really be convinced to buy something they do not want?"

Target Market Analysis

Target market analysis is performed every time a marketing or PSYOP campaign is developed. It includes selecting a target, determining conditions that affect the target, analyzing target vulnerabilities, specifying target susceptibilities, formulating the persuasive objective, determining target effectiveness, and assessing campaign impact indicators. Once the conditions and vulnerabilities of the Iraqi soldiers were identified in the Persian Gulf War, individual susceptibilities for each vulnerability were specified. Because the coalition's bombing campaign was effective, the Iraqis had needs for food, shelter, water, medical attention, and basic safety. They were, therefore, driven to respond in an expected way. Target market analysis is key to successful marketing and PSYOP.

Recommendations

My recommendations, which are based on my own analysis, are intended to serve as suggestions for improved business marketing and military psychological operations. They emphasize the transfer of proven marketing and promotion strategies, concepts, and techniques from the civilian business marketing system to the military PSYOP system.

- A primary recommendation is to accept the marketing orientation (as opposed to a sales orientation). The marketing orientation begins with the customer's needs and wants, then integrates marketing into each function of the business to design the desired product. (The sales orientation focuses on the product characteristics and attempts to sell the existing product.)**

Both PSYOP planning and marketing planning should be concurrent with, and coordinated with, all operational planning. Together, they should address the target audience's needs in any given situation. This relates to the function of PSYOP as a force multiplier in all types of military activity.

- Another recommendation is to ensure that marketing and PSYOP support all operations, to include production and finance in business or conventional and special operations in the military. This support should be for all levels of business**

operations and all levels of war-strategic, operational, and tactical; low intensity, midintensity, and high intensity.

- **A commensurate resource and budget commitment to support adequate PSYOP and marketing is required so that PSYOP and marketing can be integrated into all operational planning. It is an absolute necessity that military PSYOP and business marketing planners understand the level of resourcing necessary to conduct a successful campaign; under-capitalization may doom an otherwise promising organization to failure.**

- **The business community and the military services must accept culture as the most basic environmental determinant of individual behavior, and they must gather sufficient quantitative and qualitative information about it. Individual judgment and cultural values should not be substituted for those of your target audience.**

- **PSYOP specialists and marketing managers must be aware that social-class membership influences the acceptance of ideas, the willingness to behave a certain way, and the need to use different persuasive techniques and concepts.**

- **Persuasive messages should be aimed directly at opinion leaders; they are far more effective in securing changes among followers than are the mass media.**

- **It is important to make maximum utilization of family influence; research shows that it plays the strongest role in basic value and attitude formation.**

- **The PSYOP specialist and the business marketer must know the various needs of individuals and the corresponding specific persuasive appeals that can be employed to influence each need.**

- **Marketing and PSYOP professionals must recognize the dominant influence of the self-concept-and how consumption of goods and expression of ideas are directly based on that concept and on selective perception. They must understand the main behavioral dimensions of attitudes, so that appropriate techniques can be employed to change them.**

- **My final recommendation is an all-encompassing one. It refers to the need to educate our military and civilian leaders about marketing philosophy and psychological operations (as a unique weapons system). Also, managers and specialists**

already employed in the field need tactical training. The professional military education service school system should include courses designed to improve the awareness and understanding of PSYOP. The primary goal would be to enhance the understanding of strategic PSYOP and marketing, their benefits and long-term capabilities, and their applications in support of our national objectives.

PART II

National Policy
and
PSYOP Planning

THIS PAGE INTENTIONALLY LEFT BLANK

Introduction

This section presents articles about recurrent psychological issues and roles in formulating and implementing our national policy, objectives, and strategy. The authors explain historical and contemporary elements of the national policy process in **PSYOP** and the framework within which national **PSYOP** policy is formulated, administered, and implemented.

Dr Carnes Lord explores the historical influences on developing effective US strategy, doctrine, and organizational structure for the conduct of psychological and political warfare. While accepting that a psychological-political component is inherent in every use of the diplomatic, economic, and military instruments of national power, he urges a rethinking of the role of political and psychological factors and a revitalization and integration of their capabilities into US national strategy. Dr Lord analyzes the influences of American cultural inhibitions and the media on psychological conflict.

Michael A. Morris reminds us that national policy objectives must be clearly defined so that military objectives and strategy can be precise. He emphasizes that clarification of political objectives is the responsibility of political leaders rather than military leaders. Morris concludes that propaganda advantages can be gained through clearly stated political objectives. He suggests guidelines for distinguishing clear political objectives from vague ones.

William F. Johnston focuses attention on psychological operations as a vital instrument in national liberation wars. He believes governments of countries threatened with insurgency should regard **PSYOP**, particularly face-to-face communications, as a first line of internal defense-the Vietnam lesson. He also wants more recognition of **PSYOP** as a major instrument of low-intensity conflict and the elevation of **PSYOP** planners to "first-team" status.

Lloyd A. Free examines the role of public opinion and the psychological dimension in international security affairs. He believes that while public opinion cannot be slavishly followed, psychological data should be collected and analyzed so that government can take this factor into account in planning.

Lt Col Philip K. Katz, USA, Retired, Ronald D. McLaurin, and Preston S. Abbott include a critical analysis of US PSYOP. They focus on the communications aspect of international relations and PSYOP, identify and assess the principles and critical developments in this field, and advance ideas for progress. They stress that intelligence is the most commonly overlooked prerequisite to effective PSYOP. Their focus on evaluating the effectiveness of PSYOP challenges the reader to systematically concentrate on results. This article is clearly a historical piece that sets the groundwork for producing effective PSYOP.

The Psychological Dimension in National Strategy

Dr Carves Lord

To recall the time when psychological-political warfare was widely, acknowledged by Americans as an important instrument of national strategy requires a certain effort of historical imagination. Such was indeed the case, however, from the early days of the Second World War until the mid-1960s. The experience of World War II convinced many American political and military leaders that the psychological dimension of conflict had become critical in the contemporary world.

Totalitarian regimes that employed modern communications technologies to specialize in ideology and subversion constituted a qualitatively new strategic problem for the West. The postwar years witnessed an outpouring of academic studies in this area, most of which took for granted the necessity and legitimacy of a vigorous American response to the emerging political-ideological threat posed by the Soviet Union and the international communist movement.'

The US government allowed its propaganda, and political warfare capabilities to wither in the years of rapid demobilization immediately following World War II. Creation of the Central Intelligence Agency (CIA) in 1947, however, provided a fresh impetus and an organizational vehicle for covert psychological operations and political action in peacetime. The deteriorating political situation in Western Europe in the late 1940s created urgent objectives for the CIA's covert action directorate.

The coming of the Korean War stimulated improvements in US overt capabilities as well. In 1950, President Harry S Truman created the Psychological Strategy Board in the White House to provide a high-level focus for government-wide

activities in this area. The new International Information Administration was established within the State Department; military psychological operations were given new life (the Army established the Psychological Warfare Center at Fort Bragg, North Carolina, in 1952); and the Psychological Operations Coordinating Committee attempted to provide operational coordination among the various involved agencies.² President Dwight D. Eisenhower moved to create the US Information Agency (USIA) as an autonomous agency reporting directly to the National Security Council.³

It can be questioned whether the US government as a whole was able, in the 1950s, to develop an effective doctrine and organizational structure for the conduct of psychological and political warfare. Sharp differences of opinion existed over fundamental questions of strategy toward the Soviet bloc and over the roles of key agencies such as CIA and USIA-and coordination among the agencies left much to be desired.⁴

It could perhaps be argued that militarization of the Vietnam War was the key factor underlying the progressive atrophy of US political warfare capabilities after the mid-1960s. However, it seems evident that larger issues of governmental organization and national style or culture also figured critically in this development. It should have been clear that the assignment of political warfare responsibilities to new agencies would not eliminate-and in certain respects would probably fortify-the sources of bureaucratic resistance to this new instrument of national power.⁵ Finally, mention must be made of the cultural revolution that took place in the United States beginning in the mid-1960s. The shattering of the foreign policy consensus of the postwar decades (a result of Vietnam) meant, in the first place, a questioning of American values and the legitimacy of a leading world role for the United States. Such attitudes could only spell trouble for any strategy that depended on the confident projection abroad of America's political identity and values.

Any attempt to rethink the role of political and psychological warfare in US strategy today must take account of these fundamental and persisting obstacles. Before turning to consider them more systematically, however, it is necessary to sketch briefly the basic features of political and psychological

warfare and their relationships to other instruments of national power.

One problem is the general tendency to use the terms psychological warfare and political warfare interchangeably, not to mention a variety of similar *terms-ideological* warfare, the war of ideas, political communication, psychological operations, and more. The uncertainty of reference derives partly from the fact that this sort of warfare is waged to a considerable extent with weapons that are not truly distinctive. There are indeed distinctive psychological instruments-radio broadcasting, publications of various kinds, and educational and cultural prpgrams-that are capable of communicating information and ideas. But because these capabilities are easier to conceptualize, and to handle bureaucratically, the tendency has been to give them undue weight when it comes to defining the overall phenomenon.

There is a psychological dimension to the employment of every instrument of national power, emphatically including military force at every level. Similarly, major increments of military and economic power necessarily generate political effects. In thinking about psychological and political warfare, the tendency has been to think about the conflict of ideas, ideologies, and opinions. Yet the concept is in fact seriously misleading. Psychological-political warfare is also about cultural and political symbols, perceptions and emotions, behavior of individuals and groups under stress, and cohesion of organizations and alliances.

Using the term warfare to describe US psychological-political strategy in its broadest sense is itself problematic. Psychological-political operations need not be directed only to adversaries; neutral, allied, and semiallied nations potentially constitute highly important targets because our enemies will target them in efforts to break those alliances.

The English language apparently does not include a good term for designating psychological-political operations in their broadest sense. In recent years, and especially since the arrival of the Reagan administration, the term public diplomacy has gained considerable currency in Washington. Public diplomacy appears to encompass three distinct though closely related functions: international information, international political

action (or what may be called overt political warfare), and public affairs. The inclusion of public affairs is a recognition that it is impossible in a modern democracy to separate sharply information communicated to domestic audiences from that communicated to international audiences, but the domestic function associated with public diplomacy differs from traditional public affairs by virtue of its strategic approach and its active effort to shape the domestic political agenda.⁶

The public diplomacy rubric serves a useful purpose, but it is not and was not intended to be comprehensive. Covert political warfare was excluded from its purview from the beginning. Nor does it have any clear relationship to military psychological operations, to educational and cultural affairs, or to the range of US government activities that may be grouped under the general label of international aid and humanitarian affairs.

I would propose, if only for the sake of clarity, the following anatomy of basic psychological-political warfare functions.

Political warfare is a general category of activities encompassing political action, coercive diplomacy, and covert political warfare. In general, the first of these functions is performed by diplomatic personnel, the second by military and diplomatic personnel, and the third by intelligence personnel. Political action refers to a range of activities, including certain kinds of multilateral diplomacy, support for foreign political parties or forces, and support for or work with international associations of various kinds.⁷ Coercive diplomacy refers to diplomacy presupposing the use or threatened use of military force to achieve political objectives.⁸ Covert political warfare corresponds roughly to the covert aspects of what the Soviets called active measures; it includes support for insurgencies, operations against enemy alliances, influence operations, and black propaganda.⁹

Psychological operations, once frequently used in a general sense to designate psychological-political operations as a whole, is probably best reserved for use as a term of art to designate military PSYOP.¹⁰ Military PSYOP can encompass both overt and covert activities in both peacetime and war, and its scope can vary from the tactical battlefield to the operational

and strategic levels of conflict. Historically, however, US military interest in PSYOP has focused heavily on tactical applications in wartime. Battlefield PSYOP is sometimes distinguished from consolidation PSYOP, which is geared to securing the loyalty and cooperation of civilian populations in combat areas and is closely related to civic action conducted by military forces in low-intensity conflict situations. Another related function is troop information or education, which serves among other things-much like public affairs in relation to public diplomacy-to counter the psychological operations of the enemy.

International communications encompasses international information and international educational and cultural affairs. **USIA performs this range of functions, though other organizations-in particular, "Radio Free Europe/Radio Liberty" but also the Departments of State and Defense-perform information functions of political or strategic importance as well.** 11

A further general category is *international aid and humanitarian affairs*. This category includes foreign economic and development aid, food aid, humanitarian assistance (rescue operations, disaster relief, famine relief, etc.), and technical assistance of various kinds. Many agencies involved in such activities, including the Defense Department, the Agency for International Development, and the Peace Corps, are organizations that have dedicated missions in this area. Although these functions are bureaucratically scattered and very largely autonomous, they have a very important psychological-political component. Whether intentionally or otherwise, they serve as significant instruments of US foreign policy and national strategy.

Finally, to repeat what was said earlier, a psychological-political component is inherent in every use of the diplomatic, economic, and military instruments of national power. The art of negotiation rests on an understanding of individual and group psychology and a sensitivity to cultural contexts. Similarly, the exercise of military command at all levels involves an assessment of the psychological strengths and vulnerabilities of the enemy commander and his forces; deception and surprise are key elements of the military art. A

nation's economic and military strength creates political weight that can be exploited in a variety of ways to advance the national interest.

The impetus for rethinking the role of political and psychological factors in US national strategy has come primarily from the renewed attention given these matters by the Reagan administration.¹² Since 1981, a major effort has been under way to modernize and expand US government capabilities in the area of international communications, particularly radio and television broadcasting.

It remains doubtful that the administration has succeeded in overcoming the obstacles, both internal and external, to a thorough revitalization of US psychological-political capabilities and their full integration into national strategy.¹³ In many respects, the cultural pressures working against such an effort are as strong as-or stronger than-ever. In addition to a kind of generic resistance to such activities on the part of Americans as Americans, there has been a wholesale loss of understanding and support of them among American elites in recent years. But perhaps equally troublesome is the resistance stemming from the national security bureaucracy itself and from the continuing weakness of integrated strategic planning and decision making at the national level.

Painful as it may be to face squarely the question of American cultural inhibitions in the area of psychological-political conflict, the effort is necessary-in order not only to develop intelligent approaches for dealing with them but also to achieve cultural self-consciousness, which is essential for effective participation in this kind of conflict. It is essential because Americans tend to assume that people everywhere are much like themselves, with similar fundamental motivations and views of the world. But blindness to differences in national characteristics is apt to be a fatal handicap for anyone attempting to affect the psychological orientation and political behavior of foreign audiences.

Perhaps the most severe single limitation in the American outlook is its tendency to discount the relevance of nonmaterial factors such as history, culture,, and ideas. Americans tend to assume that concrete interests such as economic well-being, personal freedom, and security of life and

limb are the critical determinants of political behavior everywhere. It is an interesting irony that such a view is so prevalent in a country as fundamentally idealistic as the United States while the importance the Soviets attributed to ideological factors stands in some tension with the materialistic basis of Marxism.

Connected with this emphasis on material considerations is the fact that Americans, unlike many peoples, are uncomfortable with personal confrontation and argument and do not customarily debate political and ideological questions in their private lives. Americans tend to look on the political realm as an arena not of conflict and struggle but of bargaining and consensus, where strongly held opinions and principled positions and disruptive of the process and to be discouraged. This tendency makes it extremely difficult for Americans to deal effectively in international settings where basic American values are under challenge. Furthermore, American notions of fair play and due process are subject to serious misinterpretation abroad. Americans' insistence on a presentation of both sides of any argument is frequently seen as reflecting a lack of self-confidence. In general, the openness and penchant for self-criticism in American society strike many foreigners as manifestations of weakness rather than strength.

Manifest or latent in the attitudes of many Americans toward the practice of psychological-political warfare is a distaste for any sort of psychological manipulation or deception. The idea that psychological-political warfare is a black art that can be morally justified only under the most extreme circumstances is a derivative of such attitudes. That such activities necessarily involve misrepresentation or deception is in any case far from the truth. (The conveying of purely factual information under certain circumstances can have powerful psychological effects.)

Military psychological operations, such as battlefield broadcasting, have as their primary purpose the saving of lives-enemy as well as friendly lives. Indeed, such activities make both moral and strategic sense. According to the Chinese strategist Sun Tzu, "what is of supreme importance in war is to attack the enemy's strategy. . . . Next best is to disrupt his alliances.... The next best is to attack his army....

The worst policy is to attack cities." As Sun Tzu puts it, "To subdue the enemy without fighting is the acme of skill." In other words, competence in the psychological-political sphere is the essence of a rational approach to war. ¹⁴ Failure to attain such competence within the limits of one's possibilities is a failure that is all too likely to be paid for in blood.

As important as the effect of these general cultural biases is the role of the American media. Developments in the culture and operating style of the prestige media in the United States in recent years have substantially complicated any effort by the US government to engage seriously in psychological-political conflict. Before the late 1960s, it may be argued, a satisfactory understanding existed between journalists on the one hand and American military and government officials on the other regarding the proper scope and limits of press coverage of national security and foreign policy matters. In particular, the press in wartime tended to adopt the national cause and to accept broad responsibility not only for protecting sensitive information but also for safeguarding the morale both of the troops at the front and of civilians at home

Since Vietnam, there has been a dramatic change. ¹⁵ In the general wreck of the national foreign policy consensus resulting from that experience, the media have adopted an increasingly skeptical attitude-not only toward the specific policies and actions of the incumbent administration but also toward many of the fundamental assumptions that had underpinned the global position and role of the United States since World War II. The legitimacy of the American defense and intelligence establishments in particular has been sharply questioned and subjected to scrutiny by the new style of investigative journalism inaugurated by the prestige press. Most significantly, the media ended their deference to and informal cooperation with an incumbent administration in favor of a posture of neutral observer or critic. One result of this shift has been a general refusal to take responsibility for the consequences of media coverage's effect on national security policy outcomes. ¹⁶

This change in media attitudes is worth dwelling on, since the role of the media on the battlefield of the future is likely to decide whether the United States will be capable of conducting

effective military psychological operations. In general, the media now acknowledge a responsibility to avoid jeopardizing the lives of American soldiers engaged in military operations. But they do not recognize an obligation to refrain from publicizing information that demoralizes American troops, reveals aspects of American intelligence or military planning, undermines American diplomatic initiatives, or gives psychological aid and comfort to the enemy. This obligation is denied even though the ultimate effect of such disclosure may be to prolong military operations and cost American lives, not to speak of more generally damaging the international position of the United States and its ability to avoid future conflicts. Nor do the media recognize any obligations with respect to the domestic audience.

Of particular importance in this connection is the wartime role of television. To argue (as media spokesmen regularly do) that television coverage is essential to informed debate on the merits of a particular military action is unconvincing, not to say disingenuous. The information content of TV pictures is typically low or nonexistent, and the emotions such pictures arouse are more likely to defeat than to promote rational discussion. The rapid juxtaposition of death and destruction images torn out of any intelligible context, so common in television coverage of war, inevitably encourages the feeling that the war is futile, immoral, or absurd.¹⁷

Equally harmful is the practice-pursued well beyond the point of abuse by the networks in Lebanon in 1983-of interviewing American GIs on their feelings and views about the situation they happen to be involved in. To portray soldiers (and if they are looked for they will be found) who are confused, inarticulate, naive, or bitter about the reasons why a war is being fought or the way it is being conducted serves no purpose. The immediate danger to morale and the effect on allied and enemy perceptions are only part of the costs of such behavior. As in the case of media obsession with the families of terrorist victims, the effect is to pander to private concerns and emotions and to mobilize them in a way that greatly complicates the pursuit of rational policies by the US government.

All of this suggests that serious thought needs to be given to restricting or even eliminating at least television's presence on

the battlefield of the future, with or without the cooperation of the media. Particularly difficult, of course, is the question of censorship or restraint of the media during limited contingencies or undeclared wars such as Vietnam, Lebanon, or Grenada. Because the stakes in such conflicts are relatively low, the pressures for preserving peacetime rules of media engagement are difficult to resist. Yet it is precisely these conflicts in which the political and psychological element in war is predominant. These conflicts are therefore most directly susceptible to influence by media reporting. Devising acceptable arrangements for limiting media coverage of such wars in the future may well be critical if the United States is ever to engage in them successfully.¹⁸

The American media have also affected the US government's international information programs. Despite the popular image of the "Voice of America" and "Radio Free Europe/Radio Liberty" as propaganda organs fully comparable to "Radio Moscow," they have been profoundly affected by the American media's evolution over the last two decades, as well as by the general cultural climate these media have reflected. Objectivity and balance as understood by the new journalism have become the standards for these radios as well. The point here is not that a balanced treatment of American or Soviet virtues and vices is not in some sense desirable, but rather that the domestic cultural context shapes-to an unhealthy degree-the aims and methods of the US international radios.

The effective conduct of psychological-political warfare by the United States is perhaps more immediately constrained by bureaucratic and organizational weaknesses within the US government itself. There is a connection between the inadequacy of US psychological-political warfare efforts in the past and the inadequacy of strategic planning and decision making at the national level. Precisely because the instruments of psychological-political conflict are not altogether distinctive, this arena requires fully integrated planning and coordinated operations throughout virtually the entire national security bureaucracy.

We need not dwell at length on the causes of the resistance to psychological-political warfare throughout the US diplomatic, military, and intelligence establishments; they are apparent to

most of those who have had direct experience in this field. The State Department continues to ply its trade very much in the spirit of the foreign ministries of nineteenth-century Europe, with only grudging accommodation to the role played by modern communications, public opinion, ideology, and political theater in contemporary international affairs.¹⁹ The military services-in their preoccupation with technology, major weapon systems, and the big war-tend to neglect low-cost approaches to enhancing operational effectiveness, especially at the lower end of the conflict spectrum; and they tend to regard psychological-political warfare as someone else's business.²⁰

The failure of both the State Department and the military to assume psychological-political responsibilities might seem to point to the intelligence community as the natural home for such activities. Yet the CIA has generally been unwilling or unable to allow the degree of coordination with other governmental entities that is essential for an integrated national strategy in this area. There is also a feeling at the agency that the era of CIA involvement in political or ideological struggles is essentially past-that an aggressive agency role can only jeopardize more important institutional equities.

What, then, would be involved in a revitalization of US psychological-political warfare capabilities? The foregoing discussion is not meant to suggest that fundamental change is a hopeless proposition-only that it is essential for us to be conscious of the obstacles to it. We must be particularly conscious of the less tangible obstacles that cannot be fixed by organizational rewiring or other short-term measures. At the same time, useful steps undoubtedly can be taken without creating a revolution in the way Americans behave or the US government conducts its business.

Perhaps the most promising area for change is in the field of military psychological operations. The fact that military psychological operations have generally been treated as a subspecialty of special operations is a good indication of the conceptual and operational limitations under which it has long labored.²¹ Of course, the very identification of PSYOP as a special forces mission has tended to isolate it from normal military activities and bring it under a certain suspicion,

which its black connotations have further strengthened. But PSYOP has perhaps suffered most from identification with the hardware and missions of the tactical battlefield—that is, leaflet delivery, loudspeakers, and radio broadcasting. As a result of all this, PSYOP has had very low priority in terms of personnel, equipment, training, exercising, and doctrine. In addition, it has suffered from low visibility at senior command levels within the military (particularly outside the Army, which owns most PSYOP assets), not to speak of other US government organizations.

This situation is now beginning to change as a result of renewed interest within the military as well as at the national level. The rethinking of PSYOP roles and missions is still at an early stage, however, and basic doctrinal and organizational questions remain to be worked out. The Air Force and Navy appear not yet fully persuaded that PSYOP can be a responsibility of all the services and of all higher command echelons. There is increasing recognition that PSYOP need not be limited to the hardware-supported missions of the tactical battlefield but can have important applications at the operational and theater levels, particularly in low-intensity conflict situations. But there is as yet little apparent consensus on the role of PSYOP at the strategic level or in peacetime.

The tendency to think of PSYOP in terms of direct verbal communication is a strong one, and it reflects the nature of tactical PSYOP as historically practiced by the United States. However, this is a tendency that must be resisted if the full potential of nontactical PSYOP is to be realized and if the services are to embrace the full range of PSYOP activities as legitimate and proper military missions. The uniformed military generally acknowledge that the overriding purpose of US military forces is not to fight wars but to deter them. But deterrence is a psychological phenomenon, not a simple reflection of the quantity and quality of military forces; and there is every reason to suppose that foreign perceptions of US military power can be shaped in various ways to strengthen its deterrent effect.²²

Even if one accepts that it would be difficult to shape Russian and Chinese perceptions of US power, a strong case can be made for the potentially high payoffs of efforts to shape

perceptions in third world countries. Within the third world, decision making is apt to be undisciplined, inadequately supplied with intelligence, lacking in orderly staff procedures, strongly influenced by the passing impressions and phobias of a small leadership element, and subject to sudden internal political challenge.

Much could be accomplished simply through deliberate exploitation of normal US military activities such as exercises, deployments, air and naval displays, and technology demonstrations. At a higher level of activity, with the movement of military forces dedicated specifically to a psychological-political mission, PSYOP measures shade into traditional coercive diplomacy. With activities such as naval port visits and presence, missions have generally not been understood as belonging within the PSYOP framework and do not appear to have been approached in a systematic or highly coordinated manner.

A characteristic weakness of America's approach to the use of force has been the tendency to draw sharp distinctions between wartime and peacetime. One result is the penalty exacted (in terms of organization, planning, and general readiness) in any transition from peace to war. Psychological-political warfare could compensate for temporary inadequacies in deployed US forces in severe crises or in the initial stages of war. In fact, this could be an important function for the United States. In general, a compelling case can be made for reviewing and enhancing the psychological-political component of US war planning and national-level crisis management operations.

The entire area of strategic war planning is of critical importance in this context, since it is the point at which the military, diplomatic, and psychological-political components of national strategy most closely converge. Efforts to enhance and better integrate strategic planning at the national level should focus on the difficult substantive and procedural issues involved in war planning. More generally recognized is the need for integrated interagency planning in crisis situations; but here as well the potential of psychological-political warfare seems not to have been fully realized.

The foregoing discussion highlights the part of this field that is the most neglected and at the same time the most

susceptible to immediate improvement. In low-intensity conflict theaters such as Central America, there is scope for application of, the full range of US psychological-political capabilities. The strategic importance of peacetime political warfare and international communications-with respect to the third world as well as the major powers-can hardly be overestimated. It seems clear that the best hope for diminution of political-military threats from major powers lies in the relentless exposure of their populations to information and ideas from the West. The opportunities for short-term gains should not be allowed to distract us from this fundamental strategic imperative.

Notes

1. See, for example, Paul Linebarger, *Psychological Warfare* (Washington, D.C.: Infantry Journal Press, 1948); Leonard Doob, *Public Opinion and Propaganda* (New York: Henry Holt and Co., 1948); Daniel Lerner, ed., *Propaganda in War and Crises* (New York: Stewart, 1950); William Daugherty and Morris Janowitz, eds., *A Psychological Warfare Casebook* (Baltimore: Johns Hopkins University Press, 1958); and W. Phillips Davison, *International Political Communications* (New York: Praeger, 1965).

2. On the early history of military psychological operations, see Alfred H. Paddock, Jr., U.S. *Army Special Warfare: Its Origins* (Washington, D.C.: National Defense University Press [NDUP], 1982).

3. The originally top secret report of the president's Committee on International Information Activities, headed by William H. Jackson, is now available in Department of State (DOS), *Foreign Relations of the United States*, 1952-1954, vol. 2, pt. 2 (Washington, D.C.: Government Printing Office [GPO], 1984), 1795-1867. Hereafter referred to as *Foreign Relations*.

4. Ibid., 1836-60. According to the Jackson committee report,

the national information program has suffered from the lack of effective central direction. In spite of the establishment of the Psychological Strategy Board, coordination has been lacking and the various agencies concerned have largely gone their separate ways. Opportunities have been missed to take the offensive in global propaganda campaigns.... The headquarters staffs of all agencies engaged in information work should concentrate more on the conception, planning, and coordination of global campaigns and less on detailed control and execution of day-to-day operations (1840).

For pertinent remarks on the confusion regarding the mission of US information agencies, see pages 1836-38; also of interest is this remark concerning the military role:

The contribution of the armed forces to political warfare has been limited by the lack of definition of the military role by higher authority, and by an inadequate understanding on the part of military authorities that they and their commands are full participants in the political aspects of the present struggle and must conduct themselves accordingly. Military commanders and planners tend to regard the allocation of military resources to current political operations as an unauthorized diversion from tasks for which the armed forces are explicitly responsible, (1860).

Eisenhower abolished the Psychological Strategy Board on the committee's recommendation, apparently on the grounds that psychological-political warfare was too closely bound up with US policy or strategy generally for such an arrangement to work effectively.

5. Consider, for example, John Franklin Campbell, *The Foreign Affairs Fudge Factory* (New York: Basic Books, 1971), 147-77.

6. A thoughtful discussion of the functioning of public diplomacy under the Reagan administration is provided by Gifford D. Malone, "Functioning of Diplomatic Organs," in Richard F. Staar, ed., *Public Diplomacy: USA versus USSR* (Stanford, Calif.: Hoover Institution Press, 1986), 124-41. See also Carves Lord, "In Defense of Public Diplomacy," *Commentary*, April 1984, 42-50.

7. The argument for a more political approach to multilateral diplomacy is cogently summarized by Richard S. Williamson, "U.S. Multilateral Diplomacy at the United Nations," *Washington Quarterly*, Summer 1986, 5-18. On the Soviet approach to political action, see, for example, James Atkinson, *The Politics of Struggle: The Communist Front and Political Warfare* (Chicago: Henry Regnery, 1966); and Roy Godson, *Labor in Soviet Global Strategy* (Washington, D.C.: National Strategy Information Center, 1984). On the promotion of democracy as an objective of US policy, see William A. Douglas, *Developing Democracy* (Washington, D.C.: Heldref Publications, 1972).

8. See, for example, James Cable, *Gunboat Diplomacy: Political Applications of Limited Naval Force* (New York: Praeger, 1971); and Barry M. Blechman and Stephen S. Kaplan, *Force Without War. U.S. Armed Forces as a Political Instrument* (Washington, D.C.: Brookings Institution, 1978).

9. See Richard H. Shultz and Roy Godson, *Dezinformatsia: Active Measures in Soviet Strategy* (Washington, D.C.: Pergamon-Brassey's, 1984). Soviet active measures (*aktivnyye meropriatia*) encompass what is here called political action as well as covert political warfare. For a general discussion, see Angelo Codevilla, "Covert Action and Foreign Policy, II," in Roy Godson, ed., *Intelligence Requirements for the 1980s: Covert Action* (Washington, D.C.: National Strategy Information Center, 1981), 79-104.

10. A collection of (generally older) materials on this subject is available in Ronald D. McLaurin, ed., *Military Propaganda: Psychological Warfare and Operations* (New York: Praeger, 1982).

11. A discussion of the history of US international broadcasting is available in James L. Tyson, U.S. *International Broadcasting and National Security* (New York: National Strategy Information Center, 1983). For an overview of current US activities in this area, see United States Advisory Commission on Public Diplomacy, 1986 *Report* (Washington, D.C.: GPO, 1986). Examples of public diplomacy materials produced by US government agencies are DOD, *Soviet Military Power* 1986 (Washington, D.C.: GPO, 1986) and DOS and DOD, *The Challenge to Democracy in Central America* (Washington, D.C.: GPO, 1986).

12. The role of information as an instrument of national strategy comparable to the diplomatic, economic, and military instruments was emphasized in an address of then National Security Advisor William P. Clark to the Center for Strategic and International Studies, Georgetown University, 21 May 1982. Administration studies of international information policy resulted in a presidential directive on this subject (NSDD 130) in March 1983. See "rune #Up for Term Two," *Chronicle of International Communication*, July-August 1984, 1.

13. For some critical reviews by recent participants, see the remarks of Alfred H. Paddock, Jr., and Gifford D. Malone in Staar, 297-99.

14. Sun Tzu, *The Art of War*, trans. Samuel B. Griffith (Oxford: Oxford University Press, 1971). 77-78.

15. Gen Dwight D. Eisenhower told a meeting of American newspaper editors in 1944: "I have always considered as quasi-staff officers, correspondents accredited to my headquarters." That reporters acquiesced in such treatment is scandalous for a contemporary journalist; see the discussion in Philip Knightly, *The First Casualty* (New York: Harcourt Brace Jovanovich, 1975), 315-17ff.

16. The gross abuses involved in media coverage of the Vietnam War have been well documented. See Peter Braestrup, *Big Story* (New Haven, Conn.: Yale University Press, 1978); Robert Elegant, *How to Lose a War: The Press and Viet Nam* (Washington, D.C.: Ethics and Public Policy Center, 1982; originally published in *Encounter*, August 1981).

17. An excellent brief analysis may be found in Mark Crispin Miller, "How TV Covers War." *The New Republic*, 29 November 1982, 26-33. Also of considerable interest is John Weisman, "Why TV Is Missing the Picture in Central America," *TV Guide*, 15 September 1984, 2-14.

18. The controversy arising from the exclusion of the press from the US action against Grenada in October 1982 led the Joint Chiefs of Staff to initiate a review of policy regarding media participation in contingency operations, in the form of a special commission of military and media representatives headed by Gen Winant Sidle. Although this commission reached informal agreement on the principle of press participation in all military operations to the maximum degree consistent with operational security, the DOD has since indicated some reservations on this score, and there is little evidence that any significant movement has occurred on the media side. As one retired admiral is reported to have said, "Operational

security is not the problem; the problem is that when you write about us, you make us look bad." See Fred Halloran, "The Pentagon and the Press: The War Goes On," *New York Times*, 29 January 1986; and "Material and the Media," *Essays on Strategy and Diplomacy 2* (Claremont, Calif.: Keck Center for International Strategic Studies, 1984).

19. Pertinent observations on the role of the State Department in the current administration's public diplomacy efforts are offered by Gifford Malone in Staar, 132-37.

20. Consider the complaints of Fred W. Walker, "PSYOP Is a Nasty Term-Too Bad," *Air University Review* 28 (September-October 1977), 71-76, as well as Edward N. Luttwak, "Notes on Low-Intensity Warfare," in William A. Buckingham, ed., *Defense Planning for the 1990s* (Washington, D.C.: NDUP, 1984), 197-209.

21. See the discussion in Alfred H. Paddock, Jr., "Psychological Operations, Special Operations, and US Strategy," in Frank R. Barnett, B. Hugh Tovar, and Richard H. Shultz, eds., *Special Operations in U.S. Strategy* (Washington, D.C.: NDUP, 1984), 231-51.

22. Of interest in this connection is Robert Jervis, Richard Ned Lebow, and Janis Gross Stein, *Psychology and Deterrence* (Baltimore: Johns Hopkins University Press, 1985).

When Are Political Objectives Clearly Defined?

A Historical Perspective

Michael A. Moms

National policy objectives should be clearly defined. Whether the goals are strategic or tactical, they must be delineated and articulated to those responsible for implementing them.

Since the difference between clarity and vagueness in political objectives is only a matter of degree, incomplete conceptions of vague political objectives obviously leads to incomplete conceptions of clear political objectives. Nevertheless, a rough distinction can be made between vague and clear political objectives after the nature of their relative difference is understood. Most observers acknowledge that political objectives should determine the nature of military objectives and strategy-which cannot be precise unless political objectives are clearly defined.

Clarity in political objectives is the responsibility of political leaders rather than military authorities; therefore, the military services cannot be expected to impose limits on their operations if the political objectives are vague.¹ In turn, if military power is to be used efficiently and without risk of major war, political objectives must not underestimate or overestimate the military capabilities at their disposal.

Correct Generalizations

The attempts of many authors to define clear political objectives are less perceptive than their analyses of the evils that result from objectives that are vague. Most envisage clear political objectives derived from an overall objective that reflects our national purpose. They point out that limited objectives determine the nature and extent of US involvement in limited wars or interventions. Some authors add that clear

political objectives also need to be flexible so they can be adjusted to meet changing conditions.

These statements about clear political objectives are correct generalizations. Clear political objectives should be limited and should not be achieved at the price of inflexibility. Changing circumstances will always make the task of formulating clear political objectives difficult. However, attempts to go beyond generalities belie incomplete conceptualizations of vague political objectives.

A Paradox

Political objectives evince much superficial continuity and, hence, an aura of decisiveness, although they may actually encompass and conceal considerable drift and indecision. Thus, while flexibility is necessary for adapting to changing circumstances, flexibility can also become largely synonymous with drift and indecision.

Nevertheless, political objectives still may remain constant in meaning over a period of time although different strategies may be required to implement them. The difficulty is in distinguishing between political objectives that only have superficial continuity of meaning and those that really are continuous in meaning.

This paradoxical nature of vague political objectives suggests a definition of clear political objectives. A political objective is clear when it continues to represent concern for the preservation of the same specific vital interest or for the same kind of postwar peace. If the objectives are clear in this sense, they can provide adequate political direction for the choice of military objectives and strategy.

Drift occurs when political objectives are not continuous in meaning or when they are so vague as to permit several divergent strategies to appear to be adequate ways of attaining objectives. In either case, drift rather than political objectives largely determines the nature of strategy.

However, this definition applies only to those specific political objectives that guide military strategy in a specific limited war or intervention. General foreign policy objectives are, perforce, vague. For example, support of the United

Nations and interest in a world free of aggression are general foreign policy objectives that attract popular support through their vagueness.

This suggested definition of clear political objectives needs to be elaborated further by examining its relation to the concept of vital interests. Since clear political objectives must represent concern for the preservation of the same specific vital interest, it is then necessary that vital interests also be clear and specific.

Propaganda Advantages

Some propaganda advantages can be gained by grandiloquent political objectives such as the Truman doctrine's aspiration to support free peoples who are resisting attempted subjugation by armed minorities or outside pressures. However, even at that early date in the cold war, the rhetorical exaggerations involved touched off a debate charging that the United States was overcommitting itself.

The US strategy of support to Greece and Turkey against aggression refuted these criticisms; it was a clear and limited commitment. However, this clarity of strategy was due to the US policymakers' clarity of purpose and their clear grasp of US vital interests rather than to the clarity of publicly stated political objectives.

Occasionally, vital interests may be precisely formulated while political objectives are vague; for example, the Truman doctrine. Nevertheless, it is extremely difficult for political objectives to be clear when vital interests are abstract and vague.

The stark clarity of a direct Soviet confrontation with the West in the late 1940s made the determination of US vital interests relatively simple. The calculation of what were these vital interests became more complex and ambiguous as the communist threat became more diverse and subtle in the 1950s.

Abstract Vital Interests

As the paradox of abstract vital interests began to loom larger in US policy in the 1950s and 1960s, the need for clarity of political objectives continued and, perhaps, even increased as the nature of the threat changed and became more ambiguous. However, the precedent of vague political objectives set by the Truman doctrine's rhetoric continued to be the observed norm.

One of Robert E. Osgood's main themes in a 1968 paper illustrated the consequences of a heritage of vague political objectives and of increasingly vague and abstract vital interests. While the US postwar pursuit of policy objectives has shown much continuity, the US concept of its vital interests has been constantly expanding.

In Vietnam, where communist aggression was considered a threat to US security, the general requirements of containment led to an increasing US response with no question as to the precise relevance of the Vietnam War to US security. Osgood argued that the growth of multipolarity and the increasing complexity of the communist threat necessitated more precision in determining the extent to which our vital interests are involved in communist aggression.²

The paradox of abstract vital interests, then, reinforces the paradox of vague political objectives and vice versa. Together, they reinforce the indecision embedded in each vague paradox. This tends to result in policy drift and in inadequately considered, expanding commitments.

This vicious circle of vagueness and drift can be broken by efforts to relate vital interests more specifically to contemporary conditions and conflicts, and can be weakened by increasing the clarity of political objectives; that is, clarification of vital interests leads to clarification of political objectives and vice versa. More precise vital interests make it harder for political objectives to equivocate in claiming they are preserving the same specific vital interest.

On the other hand, greater clarity of political objectives would increase pressures on vital interests to be more precise. Greater clarity of political objectives would indicate the respective advantages and costs of implementing different

strategies and combinations of political objectives, which would in turn increase the chances that vague concepts of vital interests would be exposed. Such exposure would surely result in greater pressure for more precise definitions of vital interests.

Guidelines

The peculiar characteristics of vague political objectives suggest several guidelines for distinguishing clear political objectives from vague ones. Clarity of political objectives is being achieved when the following questions can be answered in the affirmative.

Is the nature of the paradox of vague political objectives understood and consciously guarded against in defining political objectives?

Do political objectives help undermine the paradox of abstract vital interests? By indicating the respective advantages and costs of implementing different strategies, do political objectives expose vague conceptions of vital interests that unwisely require prohibitive costs?

In choosing our military strategy, have we carefully considered the costs and benefits of attaining objectives that primarily demand military action versus the costs and benefits of attaining objectives that are more closely related to nation-building and internal security?

Are drift and indecision being reduced in our political objectives, our conception of our vital interests, and our choice of military strategy?

Some Thoughts on Psychological Operations

William F. Johnston

Governments of countries threatened with insurgency should regard PSYOP, particularly face-to face communications, as a first line of internal defense.

The intent of this article is not to proclaim PSYOP a panacea for "wars of liberation." The intent is to focus attention on psychological operations as a vital instrument in Ho/Mao-type wars of national liberation, especially the early stages where revolutions are hatched from grievances of the masses by communist incubation and kept at the right emotional temperature by thousands of native agitators.² Without this skillful and massive agitprop and organizational effort, which has been characterized as "half the revolutionary task," there could be no successful liberation wars.

Auxiliary or Primary?

Psychological operations should have more recognition as important instruments of low-intensity conflict.³ They have the capability to compete with the communists' conflict doctrine, which requires the integration of political, economic, psychological, and military factors of power. Aggressive nations can successfully use PSYOP on a case-by-case basis in subversive insurgency-threatened countries. PSYOP use, however, must be carefully calculated in policy and operations to reach the grassroots level. Whoever gets to the people first, with ideas that stimulate self-interest, gains a decisive lead ... and that is precisely what happened in Vietnam.⁴

Use of Media Discounted

Looking at the Vietnam War in retrospect, we see that the communists used all available media, from instigation through propaganda and guerrilla warfare to conventional military operations. Such sophisticated mass media as printed materials, leaflets, posters, pamphlets, and radio broadcasts were more obvious than the workhorse of the revolution: the agitprop cadre who operated on a face-to-face basis in the rural villages and hamlets. The US discounted the sophisticated media in the early days because it did not seem to play an important role.⁵ What no one understood at the time was that radio was being used to communicate the Communist party line to the agitprop cadres in the remote areas of South Vietnam. They, in turn, were translating the party line into action among the masses. Based on opportunities at the local level, the actions generally consisted of study sessions (learning how to read and write Vietcong propaganda), demonstrations, parades, rallies, and any other activities that would get the people involved-ostensibly in furtherance of the peoples' interests, but with the end objective of strengthening the Communist party and weakening the opposition. The US did not appreciate the magnitude of the agitprop cadres-their numbers, their effectiveness, or the extent to which they were able to get the people engaged in furthering communist propaganda.

Douglas Pike, a noted expert, claims that the various social organizations created by the Vietcong in South Vietnam and used by the agitprop cadres were developed as "self-contained, self-supporting channels of communication." In his view, these organizations were the "secret weapon" and the "heart and power of the National Liberation Front (NLF)."⁶

Pike also revealed that the Vietcong "spent enormous amounts of time, energy, manpower, and money ... explaining itself to itself, to the other side, and to the world at large." He said they were "obsessed" with doing this. Pike found that the more he studied the Vietcong, the more "it became evident that everything the NLF did was an act of communication."⁷ In other words, everything the Vietcong did was calculated to gain the optimum psychological effect.

Policymaker and Propagandist

In the communist world, psychological operations /warfare experts are represented at the highest levels of government and within the Communist party. One of their roles is to help make policy. PSYOP experts in the United States and most of the free world, however, (except for Nationalist China) appear to have little status and not much influence; several reasons are offered below.

1. Psychological operations /warfare, including propaganda, has a distasteful image. It is thought to deal in lies and variations of the truth, and is looked upon in general as a dirty business with which few wish to be associated.

2. Psychological operations cannot be scientifically evaluated as to effectiveness. PSYOP activities that cannot produce fast, measurable results are hard to sell. There are exceptions, of course; for example, when tactical PSYOP can be used to encourage a beaten enemy to surrender or in an amnesty campaign where the defectors can be counted.

3. There are very few professionally qualified and experienced PSYOP experts who also have sufficient acquaintance with the people of a specific foreign country. A major reason is that little status, low prestige, few rewards, and no high-level promotions are based on professionalism in psychological operations. There is no psychological operations career program; yet, attaining full qualification as a psychological operations expert on a specific foreign country is a lifetime job, not unlike the type of professionalism required of a psychoanalyst.

4. Insurgency-threatened countries do not give enough attention or importance to psychological operations. They often lack the know-how to start an effective psychological operations program, and they tend to place the same priority on PSYOP that the United States does in its support of that country. This priority is usually relatively low in proportion to the overall assistance provided by the US. While in the later stages of an insurgency the US may help with such sophisticated media as printed leaflets, radio, and TV, the US usually lacks expertise in the language and ways of the people. This expertise is necessary to provide advice on the content of the message to ensure that the message achieves the desired

effect. **The main burden of face-to-face education must be on the shoulders of the indigenous government and people.**

Another problem is that of convincing an insurgency-threatened government to establish an uncomplicated but credible amnesty program early in the insurgency. This program would provide, for insurgents who have changed their minds, a way out of the "victory or death" box that the guerrilla is usually in.

Chieu Hoi

The Chieu Hoi (Open Arms) Amnesty Program was one of South Vietnam's most successful programs. However, considerable time was required for the program to build up credibility and to achieve the desired results.⁹ Initially, Vietcong who wanted to defect believed, as the Vietcong indoctrination claimed, that they might be shot.

After the low point at the end of 1964, the Chieu Hoi program showed a steady increase in the number of Vietcong returnees. In 1966 there were over 20,000 defectors, double the number of the preceding year. Total defections of Vietcong returning under this program numbered more than 75,000.¹⁰ If we accept the ratio of 10 government soldiers needed for each insurgent guerrilla, this program saved the GVN and the US a troop strength of over 750,000 soldiers. From the dollars-saved angle, the total cost of the program, using a figure of \$127 to bring in a Vietcong defector, was around \$9.5 million. Since the cost to kill a Vietcong is estimated at \$300,000, killing this number of soldiers would have cost \$2.25 billion.

Indigenous Armed Forces

The United States can and should give a higher priority to encouraging insurgency-threatened governments to develop a professional psychological operations capability. This capability must include personnel, both American and indigenous, who can conduct face-to-face psychological operations. Indigenous PSYOP people must be able to

overwhelm communist-trained agitators in both quality and quantity of ideas related to peoples' desires and fears if they are to get the people motivated and committed to the government.

Indigenous military forces, paramilitary forces, or police forces would be good organizations to undertake increased PSYOP responsibilities in the rural areas. One reason is that these forces represent the best organized and most cohesive institutions in many developing countries, particularly in the rural areas. Also, better results will be achieved in the remote rural areas if the peasants know that an iron fist is underneath the velvet glove of the communists' friendly persuasion. (Changing the ways of peasants is a real challenge.)

Every member of those military and police forces that are in contact with rural people should be trained to talk to the people-and doing so should be required as part of their duties. This would include interpreting news and participating in educational activities. They must also be prepared to discuss persuasively what the government is doing for the local people.

The main focus should be on developing specialized PSYOP units in the rural areas. These units should consist of local natives. Very important, also, is the establishment of a two-way communication system to ensure that popular grievances and good ideas get to the PSYOP planners and decision makers at the top level-and that governmental PSYOP policy guidance gets down to the lowest PSYOP level. This policy guidance must be centralized and controlled at the top, but implementation of the policy must be decentralized at the grass roots.

Lower-level PSYOP people should spend about one-half of their time in investigating and preparing so as to tailor their talks and educational activities to fit the local needs. Once the real needs of the rural people are ascertained and transmitted to the top echelons, there is more reason to hope that the government will help the people help themselves. This would go a long way toward preventing the communist agitators from generating revolutions out of grievances, hatreds, and social injustices.

Conclusions

In conclusion, insurgency-threatened governments can be expected to heed US advice if it is in the form of lessons learned at great cost. Indigenous governments must put a high priority on psychological operations, particularly on face-to-face education and on countering communist agitators. These governments must recognize that a face-to-face psychological operations capability must be developed from the people, by the people, and for the people of each particular language group, tribe, clan, or area of the country-and this takes time. Developing a successful capability requires careful selection and training of candidates. This is not something that can be "made in the USA" and exported.

The US military can and should develop mature, fully qualified, professional PSYOP experts who are experienced in the language and the thinking of a foreign people. Such experts could help governments with PSYOP organization and management, as well as providing support with our more sophisticated mass media. Psychological operations planners, both US and indigenous, must be raised to the first-team level. This is crucial for success! PSYOP planners must have ready access to top authorities. Governments must translate top-level interest and support into meaningful terms for people at the grassroots level. Feedback from the people to the top level is equally important. This interest from government is essential to winning and maintaining the support and loyalty of the people. Such a psychological operations program would be one of the cheapest and best security investments the US could make in the developing world.

Notes

1. This article consists of excerpts from "Neglected Deterrent: Psychological Operations in 'Liberation Wars'," *Transition*, nos. 12 and 13 (January 1968): 58-65. Reprinted with the permission of the Foreign Affairs Executive Seminar, Foreign Service Institute, and its author. The communist psywar instrument was simply a means to an end-communist domination over everything that was not already under communist control.

2. Late in the China conflict, Gen George C. Marshall realized that the battle for the mind waged with ideas and propagated by mass communications media could be decisive in countering the liberation war in China. In

1947, upon return from his unsuccessful mission to China, Marshall said, "China might have been saved by the massive use of radio and motion pictures, on a scale hitherto unheard of." William Benton, "How Strong Is Russia? And How Weak?" *New York Times Magazine*, 10 June 1956, 70.

3. Robert Holt and Robert Van de Velde, *Strategic Psychological Operations* (Chicago: University of Chicago Press, 1960), 64. These authors state that the US has never fully understood the nature of the psychological instrument.

4. Stefan Possony in "Viet Cong Propaganda War," *Los Angeles Times*, 11 July 1967, gives a good analysis of international propaganda based on captured documents. He concludes that although Americans are not conscious of it, the US was the target of a well-orchestrated and skillful Vietcong propaganda offensive after 1961.

5. Radio Hanoi and Vietcong clandestine transmitters were important for getting the Communist party line and other instructions to the leadership and agitprop cadres in remote areas-information which otherwise would have been delayed for weeks. Broadcasts were made in all five major languages used in Vietnam. Beginning in 1960, there was an increase in the use of all types of media in an accelerated propaganda offensive against the government of Vietnam.

8. See Slavko Bjelajac, "A Design for Psychological Operations in Vietnam," *Orbis*, Spring 1966. Bjelajac concludes that "psychological operations are indispensable" and in a Vietnam-type war "should be accorded a priority at least equal to any other weapon or technique in the Vietnamese protracted conflict."

9. The task of defecting a Vietcong in the Chieu Hot Program was primarily a psychological operations task. However, Aid for International Development (AID) Vietnam played an important role, since AID furnished the resources for most of the food, housing, and allowances given to the Chieu Hot.

The Role of Public Opinion

Lloyd A. Free

Public opinion cannot be slavishly followed, but psychological data should be collected and analyzed so that government can take this factor into account in planning.

The following excerpts are from an exchange of letters that took place at about the time of the Vietnam moratorium in the fall of 1969. One writer was a Georgetown University sophomore with the unknown name of Randy Dicks, the other a president of the United States with the well-known name of Richard Milhous Nixon.

Randy wrote the president:

I think that your statement at your recent press conference that "under no circumstances" will you be affected by the impending antiwar protests in connection with the Vietnam moratorium is ill-considered, to say the least. It has been my impression that it is not unwise for the President of the United States to take note of the will of the people. After all, these people elected you. You are their President.

The president replied, in part:

There is a clear distinction between public opinion and public demonstrations. To listen to public opinion is one thing; to be swayed by public demonstration is another.... Whatever the issue, to allow Government policy to be made in the streets would destroy the democratic process. It would give the decision not to the majority and not to those with the strongest arguments, but to those with the loudest voices.

Introduction

What is the role-the actual and proper role-of public opinion in international security affairs? And how, if public opinion does and should count, is majority opinion to be determined?

The assumption that public opinion, both at home and abroad, is somehow important is borne out by the efforts of political leaders to woo it and by the practices of governments to influence it. All major governments in the world today, and many of the minor ones, spend varying amounts of time, money, and attention on attempts to influence the opinions of their own citizens and the citizens of other countries.

Yet, even in our recent history, when a sense of the importance of public opinion has become more self-conscious than it used to be, there have been unbelievers. Harry Truman, whom I nevertheless admire as one of our great presidents, was one of them. When Mr Truman faced a problem, he would find a principle involved, often a moral principle, and then make his decision accordingly. And he would stick to that decision come hell or high water. With this approach, public opinion and opinion polls are irrelevant, you simply do what you think is right.

The late, great John Foster Dulles adopted this same approach. He once said in my presence:

If I so much as took into account what people are thinking or feeling abroad, I would be derelict in my duty as Secretary of State.

Another of our great secretaries of state, Dean Acheson, claimed, disapprovingly, that Americans have a "Narcissus psychosis." "An American," he wrote, "is apt to stare like Narcissus at his image in the pool of what he believes to be world opinion." After making the point that the only honest answer people generally could give to questions about the specifics of foreign policy would be a "don't know," he made this observation:

World opinion simply does not exist on matters that concern us. Not because people do not know the facts-facts are not necessary to form opinions-but because they do not know the issues exist.

Thus, we are faced with some very basic questions: Does such a thing as world opinion exist? Do people in the United States and other parts of the world really have meaningful opinions of any significant scope in regard to international issues? If so, are these opinions of importance to foreign relations and international security affairs? Your own instinctive answer to these questions may be an unqualified

"yes" or an unqualified "no," but after years of experience in the public opinion field, my own answer is very equivocal-namely, it all depends.

Definitions and Assumptions

To start with, I must define some of the terms we will be discussing. An opinion, in my terminology, is simply an expressed attitude-an attitude that is communicated. An attitude, on the other hand, is really more of a perception-a way of looking at a given subject.

In the course of our lives, we build up all sorts of assumptions based on our experiences and these assumptions influence what we perceive as the world in which we live. In other words, we participate in creating our own realities and our attitudes spring from these "realities." They are the result of an interplay of our assumptions, as shaped and modified by experience. In a very real sense, if an individual has no assumptions concerning a given subject, or that are capable of being related to that subject, he can have no attitudes-and hence no opinions. And any opinions expressed by an individual will be meaningful only if he in some way relates the subject to his own purpose, no matter how narrow or broad it may be. The range of his sense of purpose is delimited by his "reality world."

Every individual has blind spots of greater or lesser scope-that is, subject matter areas about which he has no assumptions and, hence, no attitudes. It is difficult for many people to realize what a large proportion of the people of the United States, not to mention the underdeveloped areas of the world, have no assumptions, attitudes, or information about international affairs.

Let me cite from a study I did in this country a few years ago. One-quarter of the American public had never heard or read of NATO, only 58 percent knew that the United States is a member of NATO, and only 38 percent knew that the Soviet Union was not a member-facts which go to the very nature and fundamental purpose of our most important alliance! One-quarter of the adults in this country did not even know that the government of mainland China is communistic!

In short, at least two-fifths of even the American people are far too ignorant about international affairs to play intelligent roles as citizens of a nation that is the world's leader-and only about one-fourth are really adequately informed. The situation in most other countries of the world is far worse, particularly in underdeveloped areas. For pollsters to ask these uninformed people about specifics of foreign policy is obviously an exercise in futility. Looked at in this perspective, one can begin to see the validity of Dean Acheson's views and to question the common assumption that, if enough people at home and abroad are persuaded to adopt a given opinion, then the policy of their government will be affected-at least in democracies.

Opinion Leaders and the General Public

Before we write off the importance of public opinion in international security affairs, however, let us introduce some other aspects of the problem. First, we must recognize that when it comes to the "nitty-gritty" day-to-day decisions on specifics, public opinion usually has no effect. Either the public has no opinions on the matter or people do not know that decisions are being made. On a broad range of matters that are publicly known, there is usually an educated elite who do have meaningful opinions, in varying degrees of intensity, about international security matters.

This elite may be of greater or lesser size, depending upon which country is involved and which issue is in question. However, the fact that it may be small does not derogate its power. We can meaningfully define world opinion abroad or significant opinion at home in terms of the publics that count in the particular situation, whether limited or mass.

Beyond this, however, elements of the public can and often do get into the act, not only in the United States, but also in the underdeveloped areas. The people may lack meaningful opinions on a wide range of specifics about international matters, but their broader assumptions may come into play at certain times and places to make a given international issue a matter of public concern. Often this applies only to a minority of the greater public; frequently the people are whipped up and

organized for ulterior ends, whether by the communists or by local leaders-but react they do!

Publication

The action may be as peaceable as signing a petition or writing a letter to the local newspaper (both of which are apt to be relatively ineffective), or to writing a personal letter to the president (as Randy Dicks did), or writing to one's congressman. (The latter action may actually be of some influence; the attention paid by members of Congress to their mail is out of all proportion to its significance as a barometer of public opinion.)

But, increasingly, more extreme manifestations of public action-demonstrations, picketing, and rioting-reflect attitudes that are strongly held by at least some segments of the public. These forms of public action have become a phenomenon of worldwide scope. For example, rioting in Japan and Korea made it exceedingly difficult for the two governments to normalize their relations. Demonstrations in Panama were unquestionably instrumental in causing the US-after a decent interval, of course-to agree to revise the Panama Canal Treaty. Demonstrations and potential riots in the Middle East have made it difficult for the Arab governments to follow a policy of moderation in the Arab-Israeli conflict. Anticommunist violence in Indonesia strengthened the hand of the army against the Communist party in a struggle that has had profound international implications. Anti-Vietnam protests in the United States unquestionably affected the calculations of the North Vietnamese, not to mention those of our American leaders.

But the greater public also gets into the act in a more regular and generally more peaceable way in the form of periodic elections, not only in the democracies but also in some of the semidemocracies (if not the "guided democracies"). In such elections, international matters can and often do enter as central issues of the campaign.

But then, one does not have to search very far back in US history for other examples: Woodrow Wilson's campaign theme, "He kept us out of war," helped him win the election in 1916; and Gen Dwight D. Eisenhower's promise to go to Korea

increased his landslide victory in 1952. In fact, it is almost axiomatic that whenever war or peace seems to be at issue, the public in almost every country will exhibit deep concern in ways that have political meanings.

Global Public Opinion

More broadly, a close study of the matter has convinced me that there are widely shared attitudes on international matters, amounting in many instances to consensuses which governments simply must take into account. Sometimes these consensuses are global. With apologies to Dean Acheson, there are, on occasion, worldwide or virtually worldwide reactions on matters that concern us.

One occasion was the Suez affair in 1956. I have little doubt that the United Nations well-nigh universal condemnation of the Israeli-British-French invasion of Egypt was supported by what can only be called a consensus of world opinion-a consensus shared even by many people in both the United Kingdom and France.

A similar consensus of condemnation seems to have existed over the Soviet Union's occupation of Czechoslovakia-a consensus apparently shared even by a good many people who were communists themselves.

Another is the worldwide impact of Russia's launching the first two sputniks in 1957, followed by its subsequent achievements in space. These developments led to reevaluations of the relative standings of the two superpowers, extending not only through official circles and elites but to general publics as well. In fact, data show that people throughout the world ranked the Soviet Union and the United States just about equally in terms of power and importance in those days, an enormous contrast from the days before 1957.

This perceived equality contributed, along with other developments, to the idea that a stalemate existed-a notion that affected the foreign policies of most of the world's nations.

Regional and National Attitudes

Short of these global consensuses, some basic attitudes are so widely held in certain regions or areas that they must be taken into account, both by the governments which rule there and by others dealing with them. The phobia in Latin America against American intervention is one example. Similarly, in almost all of Africa and Asia, basic attitude patterns opposed to imperialism and neocolonialism are deeply rooted. Other examples are the anti-Israeli "set" of the Arab world and, fortunately for us, the anti-Chinese bias in much of Southeast Asia.

In addition, there are many situations where there is a meaningful consensus of public opinion in particular countries. One example is the almost universal aspiration that the West Germans held for Germany's reunification. Other examples are the fear and hatred of Germans that were held by most Russians and Poles, and the Japanese public's opposition to full-scale rearmament.

The American people, too, have certain fixed ideas. One is opposition to foreign aid: Six out of 10 Americans favor either reducing economic aid to foreign countries or ending it altogether. Another is the very high degree of concern to keep our military defense strong at the same time that more than one-half of the public thinks we are spending too much on defense. In a related vein, almost six out of 10 Americans think the US "should take all necessary steps to prevent the spread of communism to any other parts of the free world, no matter where." Anticommunism is, in fact, clearly one of the strongest factors in Americans' ideas about US international security policies.

Policies and Opinions

In any particular country at any given time, there are programs and policies for which no government or leader can engender public endorsement. In other words, the climate of opinion imposes limits-sometimes very broad, sometimes very narrow-on each government's area of maneuver. In the extreme, certain things are virtually taboo; in other cases, they

are merely impolitic; in still others, particularly where public opinion is either in agreement, nonexistent, divided, or lacking in intensity, anything is acceptable. Although policymakers sometimes appear blind to the fact, the achievement of many-if not most-of the international security objectives adopted by the United States presupposes certain perceptions, attitudes, beliefs, and behaviors on the part of various persons in this and other countries.

Usually, on day-to-day matters, the opinions of key members of Congress and/or officials of foreign governments are important for the accomplishment of particular US objectives. On more important matters, the list of people who have influential opinions may include members of elite groups that have power or influence in our own or other societies. Often, the educated elements of the general public may also have a bearing on the success or failure of US policies. Frequently, the opinions of peoples as groups are important, either because popular support or cooperation is necessary or because the people show their concern by way of protests, demonstrations, or elections.

Often, psychological factors are critical to the success of US policies. If these factors are absent, it is futile to adhere to a policy which presupposes them. Taking into account, for instance, the feelings of the majority of the Chinese people toward the Chiang Kai-shek regime in 1949, no amount of effort or determination on the part of the United States could have prevented a communist takeover of mainland China. As another example, consider that the US supported French rule in Algeria for years, despite the fact that the psychology of the Algerians-not to mention the French-made this goal impossible.

In another aspect of French international security affairs, it was public opinion, more than anything else, that forced the French military to fight the Indo-Chinese war with one hand tied behind its back; victory was impossible. The French people would not condone the necessary national effort, so the government found it impolitic to send draftees to fight in Indochina. The current malaise in the European community and the disarray in NATO are prime examples of the limits that psychological factors can place on national objectives.

Public Opinion, Political Pressure, and Prophecy

Finally, to prove what a valid prophet I can be on occasion-and, of course, I like to forget those instances where my judgment proved faulty-let me quote from a lecture I delivered when the trends of American opinion about the war in Vietnam were still pretty obscure.

Our own Government will undoubtedly now have to face up to the fact that the American people are sick and tired of the war. It is my considered judgment as a so-called "expert" that we are in the early stages of an inexorable tide in favor of pulling out of Vietnam. There may be riptidA from time to time which will temporarily obscure the direction of the current, but it is my belief that however you and I may feel about the matter, the movement down below will continue ever more strongly in favor of disengagement.)

Of course, as usual when I stick my neck out, I had some data to rely on. In the aftermath of the Tet offensive, studies conducted in this country showed that in mid-February 1968, immediately after the offensive, the majority of Americans remained hawks. In fact, hawkish sentiment increased in the immediate sense after the Tet offensive, favoring further escalation of the war. One-quarter of the American people advocated gradual escalation and no less than 28 percent opted for "an all-out crash effort in the hope of winning the war quickly, even at the risk of China or Russia entering the war."

By June of the same year-1968-the picture had changed materially. One-half of the public had shifted to the "dove" side, with 7 percent favoring a cutback in the American military effort and 42 percent wanting us to discontinue the struggle and start pulling out of Vietnam-this latter figure being almost double what it had been just four months earlier.

By June of 1970, Gallup had found that the proportion of people thinking that the US had "made a mistake in sending troops to fight in Vietnam" had risen from 25 percent (in March of 1966) to 56 percent. About one-half of the people now favored withdrawal, either immediately or at least by July 1971.

Policymakers and Public Opinion

There is a real question about the sensitivity of our policy-makers to psychological factors that have a bearing on the success or failure of our international security objectives. There is also a question about those policymakers' receptivity to the results of public opinion polls and other forms of policy-oriented psychological research. I can only speak on the basis of my own experience and that of my late associate, Hadley Cantril, plus years of personal observation of the government process. And from these points of view, I would say that the record is spotty at best. However, recent presidents have shown an awareness of the importance of psychological factors.

Oddly enough, the supreme example of sensitivity to public opinion-and of consummate ability to influence it-came in the earliest days of scientifically conducted polling. The man of the hour was Franklin D. Roosevelt. Tommy Corcoran once credited Roosevelt with having said, in effect, that he was the captain of the ship but that events and public opinion limited his power while providing instrumentalities for exerting power.

Particularly after the adverse reactions to his famous "quarantine" speech, Roosevelt was determined not to get too far out in front of public opinion in connection with the war in Europe-nor to stay any farther behind than he thought he had to. In this connection, he followed the polls with great interest-particularly charts of American public opinion specially prepared for him by Mr Cantril, who had conducted surveys throughout this period.

President Eisenhower

President Dwight D. ("Ike") Eisenhower was less consciously interested in domestic public opinion polls than Roosevelt had been. This was probably in part because Ike was so popular and his administration so relatively noncontroversial. But I know from my own experience that he was deeply interested in the opinions of people in other countries. While working with Nelson Rockefeller, who was a consultant to the president in

1955, I started a series of periodic reports on the psychological situation abroad.

The president read these reports carefully and followed them with great interest. (The common notion that he did not read documents is ridiculous; every single report I submitted to him through Rockefeller was read-and annotated-by the following morning. And this goes even for a 67-page document, single-spaced, which I know he read in full because he corrected a typographical error in his own hand on the next-to-last page!)

On more than one occasion, after John Foster Dulles had given one of his masterful briefings to the National Security Council (NC), the president was heard to say, "But, Foster, you forget the human side," as he pulled out one of my reports and read from it. As a result of that, I was the second most hated man (by Dulles) in Washington, Rockefeller being the first!

By 1955, my reports to President Eisenhower had shown a sharp increase in skepticism abroad about America's peaceful intentions. This skepticism helped to create receptivity to an idea that Rockefeller had advanced and which had been cold-shouldered-namely, the "Open Skies" inspection proposal. When Eisenhower finally propounded Open Skies, it had as great a psychological impact as any one-shot propaganda move since World War II.

President Kennedy

Jerome Wisener says that John Fitzgerald Kennedy knew clearly that he could exercise his power only if he had the consensus of the people and the Congress behind him. As a result, Kennedy was a fervent believer in polling. He depended heavily on the findings of special surveys conducted for him by Lou Harris on domestic opinion, including international issues. He also followed closely the United States Information Agency (USIA) data on opinion abroad. On a number of occasions, he personally requested that certain surveys be made-especially in Latin America.

In the aftermath of the Bay of Pigs, USIA found that Fidel Castro was little known in Latin America and was generally viewed by the public with considerable allergy. Subsequently,

the Kennedy administration adopted a relatively low-keyed approach to Castro and Castroism.

President Johnson

In the early days of his administration, Lyndon Baines Johnson regularly used Oliver Quayle's polls, including those on international issues. President Johnson kept a loose-leaf notebook, not only of the latest surveys taken in the United States by Quayle, Gallup, and Harris, but also of polls conducted abroad.

Following the American intervention in the Dominican Republic, I sent to the White House a report I had prepared in June of 1962, *Attitudes, Hopes and Fears of the Dominican People*. It showed that the Dominicans, as of then at least, were the most pro-American, anticommunist, anti-Castro people we had found in any part of the world. Not only did President Johnson read the report; the White House had it duplicated and distributed at the highest level and said that it had proved "very helpful." I have little doubt that this report was one of many factors that influenced the Johnson administration to shift from supporting the military junta to working toward a coalition solution.

Against such "successes" as these, however, must be set some glaring "failures," where research findings were ignored in framing US policies. The most cataclysmic of these had to do with the Bay of Pigs invasion. A year before, I had managed "by the skin of my teeth" to get a public opinion study done in Cuba. It showed that Castro was overwhelmingly popular with the Cuban people. There was a small opposition, but it was confined almost entirely to the city of Havana. Thus, whatever the expectations of those who planned the invasion, it came as no surprise to many that there was no popular uprising to assist the Bay of Pigs invaders.

The study had been made available to the government as well as to the public, and had actually been sent up to the White House. However, between the time the report was issued and the attempted invasion, there had been a change of administration-Kennedy had come into the White House. And our findings were not called to the attention of the new

president or anyone on his staff when they were considering the question of invading Cuba.

Although called a "success" when submitted to President Johnson after the Dominican intervention in 1965, a Dominican study conducted after the fall of Trujillo found that the invasion had been a "failure" when the results were originally made available to the government in 1962. The report included the following flat statement:

An extremely serious situation of popular discontent and frustration, fraught with a dangerous potential for upheaval, exists in the Dominican Republic. Never have we seen the danger signals so unmistakably clear.

Yet, despite this urgent warning, the US government devised well-merited but long-range solutions to Dominican problems and neglected short-term emergency programs which might have avoided later problems.

The neglect of such research findings demonstrates a fact which has become crystal clear to me from my years of experience within the State Department and my subsequent observations as a researcher and government consultant. A considerable proportion of our government, with particular reference to the State Department and the Foreign Service, tends to be insensitive to the importance of psychological factors in international affairs. Within our US government there is no systematic collection of such data and, despite the interest of the White House, no systematic marshalling of whatever material may be available. (It is not without significance that the special polling of American public opinion that was inaugurated by the State Department after World War II and was conducted under the very distinguished and able direction of Schuyler Foster, whom some of you probably know, was discontinued in the latter half of the 1950s.)

As to psychological factors abroad, more than one ambassador has echoed the words of one of their colleagues: 'To hell with public opinion! I'm here to deal with the government, not with the public!' He said this, incidentally, while serving in a country which later went into an acute crisis because of public turbulence.

It is against this multifaceted background that I said the record of our policymakers is spotty when it comes to paying

attention to "the psychological." Some policymakers (particularly at the highest level) have paid attention; some have not.

Conclusion

In closing, let's put this whole matter into broader perspective. No responsible critic maintains that our government should slavishly follow public opinion or that US foreign policy should be based exclusively, or even primarily, upon courting momentary popularity at home or abroad. Often, governments that deserve the adjective "responsible" will have to fly squarely in the face of domestic opinion while attempting to change it.

Bill Moyers once told a story that is pertinent in this respect: During a period of crisis, President Johnson and his advisors were meeting in the cabinet room to discuss alternative courses of action. At a particularly exasperating moment, when no option appeared likely to succeed, one of the men exclaimed wearily: "If we only knew what the people of this country really want us to do!" The president studied his melancholy advisor for 39 seconds, then answered: "If we knew what they wanted us to do, how could we be sure that we should do it?"

Any government worthy of its name has to do what it thinks necessary for the good of the country, but its course can be greatly eased if it has public opinion on its side. Decision making demands a knowledge of how the people are thinking and feeling-and why.

Even more often, governments must fly in the face of opinion abroad. This is especially true of the United States as it pursues its role of world leadership: if we aid India to rearm against the Chinese threat, we are bound to incur the wrath of Pakistan; we cannot assist Israel without provoking an anti-American outburst from the Arab world; fighting the war in Vietnam enraged the "doves" in many parts of the world. It is clear, then, that a certain price must be paid in at least psychological terms-and it should be incurred knowingly, after both a careful assessment of the benefits and risks and a calculated attempt to devise ways to minimize unfavorable impacts and maximize favorable ones.

After the Tet offensive, Gen William C. Westmoreland said that the results were psychological, not real. Well, he and his colleagues had better learn that when it comes to accomplishing US objectives, psychological factors can be just as "real" as guns, ships, planes, or nuclear weapons. This is because human beings are always the ultimate movers and shakers, and humans are psychological animals.

In short, psychological data needs to be systematically collected and cranked into the intelligence appraisals of given situations. And these data, both domestic and foreign, should be taken into account in framing foreign policies and enunciating international positions. The psychological requirements for achieving US objectives need to be carefully calculated from the start, and every effort must be made, through leadership, persuasion, and public diplomacy, to secure their fulfillment.

Simply put, psychological data is essential if the United States is to be an effective leader in today's world. And its employment is imperative if the president of the United States is going to lead a unified American people into the future.

THIS PAGE INTENTIONALLY LEFT BLANK

A Critical Analysis of US PSYOP

**Lt Col Philip P. Katz, USA, Retired
Ronald D. McLaurin
Preston S. Abbott**

In an era during which it has become very fashionable to discuss the psychological aspects of international relations and during which the study of that field has been greatly influenced by psychological theories and research, particularly in America, little attention has been focused on the communications aspect of international relations; that is, psychological operations. In this essay, we identify and assess the principles of-and some developments in-this field. We also advance several modest proposals for further progress in analysis.

Introduction

Psychological operations is that specialized field of communications that deals with formulating, conceptualizing, and programming goals, and with evaluating government-to-government and government-to-people persuasion techniques. Properly defined, PSYOP is the planned or programmed use of human actions to influence the attitudes and actions of friendly, neutral, and enemy populations that are important to national objectives.) The critical variable is, then, the perceptions of foreign populations.² Propaganda is only the most obvious example of a persuasive communication. Because psychological operations are designed to influence actions or attitudes, the parameters of the field can be seen in terms of Harold D. Lasswell's classic communications model:

*Who Says What
In Which Channel
To Whom
With What Effect.*³

We know that a government spokesman is saying something in some channel to foreign populations with a view to influencing them. The specific operation is then defined on the basis of what, in which channel, and with what effect. Psychological operations, then, is a truly interdisciplinary phenomenon, lying in the interstices of psychology, sociology, communication, and political and military sciences.^{4,5} PSYOP is communication that "embraces the study of persuasiveness, on the one hand, and persuadability on the other. It also involves the study of attitudes-how they are formed and how they can be changed."⁶ In practice, however, psychological operations requires inputs from linguists, ethnologists, historians, cultural anthropologists, and area specialists, along with others from the humanities, natural sciences, and social sciences.

Historical Review

Leaders have used persuasive appeals as far back as recorded history allows us to search; Americans, authors of the Declaration of Independence and other brilliant psychological operations, were far from unfamiliar with this tradition. The process of psychological operations remains essentially what it was when Gideon defeated the Midianites but, like many other human enterprises, it has become infinitely more complex. The development of mass communication-broadcasting, worldwide wire news services, mobile printing presses, motion pictures-provides instruments of psychological operations previously undreamed of, as may be seen from the scale on which they were used in World War II as compared with previous wars.

No one who lived through or read about the collapse of France in 1940 will ever forget Goebbels's development and use of psychological operations as major political and military weapons of attack. The Nazis orchestrated the use of radio, the press, demonstrations, group meetings abroad, agents, displays, fifth-column terrorism, and, once the attack started,

screaming dive bombers (the memory of which is terrifying to many). The Nazis gave the first full-dress demonstration of what psychological operations can accomplish with the new tools of mass communication and the new weapons of military warfare. And once the meaning of what they had done came to be understood, all the major combatants who had not already done so were compelled to institutionalize psychological operations in their own plans and concepts of modern war. Nevertheless, while there were many programs, no systematic, centralized planning was undertaken in the United States until World War II^{9,10}—and the organization and resources developed during the war were quickly reduced following its conclusion. There was some effort to study the lessons learned from PSYOP programs, but the analyses were disseminated unevenly in the government and military services. The civilian Office of War Information (OWI) was disestablished and the propaganda function was passed to the Department of State.

During the 1950s, however, American psychological operations received renewed attention. The highly ideological character of the cold war rivalry and the political nature of the Korean War led to an emphasis on the psychological aspects of conflict. Courses of instruction were developed and "PSYOP" was rationalized within the services. In the civilian government structure, PSYOP was rationalized within the United States Information Agency (USIA). During this period, which was characterized by a political more than a military conflict, channels such as "Radio Free Europe," "Radio Liberation" (later "Radio Liberty"), "Radio in the American Sector" (RIAS), and the "Voice of America" (VOA) were primary PSYOP agents. They communicated news, ideas, and opinions across political boundaries—not infrequently with significant effects.

Unquestionably, the largest American effort in psychological operations since the second World War occurred during the Vietnam War. From the 1950s until the early 1970s, the US government placed substantial emphasis on psychological aspects of its world role, first in its rivalry with the Soviet Union, second in its assumption of global leadership, and finally in Vietnam and other local conflicts. However, the growth of detente and the apparent failure of PSYOP in Vietnam contributed to a continuation of the pattern whereby persuasive

communications resources are drastically reduced when there is no longer a perceived immediate need for them.

General Principles

Effective psychological operations requires several basic ingredients: adequate intelligence, coherent organization, sound planning, and a systematic evaluation of feedback. Intelligence is the most commonly overlooked prerequisite to an effective PSYOP program. From a PSYOP perspective, intelligence is the basis for understanding the communications, emotions, attitudes, and behavior of individuals and groups.

Basic to the understanding of persuasive communications is the fact that audience factors are the principal constraint on communication effects. Although studies have been conducted on source attractiveness, trustworthiness, and background, it is the audience's perceptions of credibility that count. ¹¹ Explorations of the phrasing, ordering, and other presentation factors continue to show that the critical variables in determining communication effects are audience factors—education, exposure to opposing views (previous or subsequent to the message), extant opinions, and culture. ¹² In addition, such wholly audience considerations as target composition and persuadability are clearly beyond the influence of any communicator. ¹³

Since the target population in effect sets the parameters of persuasion, intelligence must provide sufficient accurate data to support the development of programs and messages to optimally affect the audience in all its diversity. ¹⁴ Information must be timely, thorough, and systematic.

Organization is important because it must unify the diverse parts of the complex process of intercultural communications. Without sound organization, no single aspect of the process can contribute efficiently to the system. Breakdowns will occur within as well as between program responsibilities. Examples are given below.

Planning is essential at all levels, from tactical operations to long-range, strategic activities. The psychological plan, the basic instrument for integrated and concerted operations, must be designed to exploit all of the source advantages possible. The plan should use intelligence to determine the

media, messages, and compositions most likely to support the attainment of national objectives.

To implement PSYOP plans, the program must extend beyond words to actions-and actions must be an extension of words. An effective program of persuasive communications draws on real action attributes and elaborates a realistic and concrete future course. Political and military actions are critical elements in psychological operations.

In order to continue to improve the effectiveness of the program, a system to collect, analyze, and exploit feedback on past operations must be established. Because of the weakness of traditional measures of PSYOP effects, this requirement has too often been neglected.

Organization

It is perhaps a truism to say that an organization should be so constituted that it is capable of effectively carrying out the functions assigned to it. In this section, we emphasize the essential functions of psychological operations and explain how these functions are currently managed in the United States.

An institutionalized structure is essential for the effective implementation of psychological programs. There must be a defined organizational structure with clear lines of authority and responsibility for the development and implementation of policy, plans, and operations. Whether strategic or tactical in scope, the psychological operations mission requires the staff and personnel necessary to develop and implement policy, develop and execute plans, collect intelligence, evaluate programs, and conduct operations.

Policy

A first requirement for conducting meaningful psychological operations is the national-level development and implementation of clearly articulated PSYOP policy in support of political, social, economic, or military goals. The government must establish realistic policy goals to ensure consistent and credible operations. Credibility of policy objectives is the core

element in effective psychological programs. False or inconsistent national policy can destroy the best plans and programs.

One example of a poor policy and a lack of understanding was Hitler's attitude toward the Vlasov movement in which he failed to exploit the psychological aspects of Russian Nationalism in 1943.^{15, 16} Based on policy, appropriate psychological objectives to support operations can be articulated. Programs designed to implement objectives should not be academic-they must be credible and an integral part of the operational environment. For example, if the psychological objective is to induce enemy defection and/or surrender, appropriate actions must be taken by military commanders to ensure that friendly forces clearly understand the surrender policy, will honor safe-conduct leaflets, and will establish appropriate policy concerning the good treatment of enemy prisoners in POW camps. In an insurgency or political environment, the government must develop and implement a credible amnesty policy regarding the insurgents and their supporters.

In the United States, the development and implementation of psychological policy is the responsibility of the executive branch of government. The National Security Council, Department of State (DOS), USIA, and other appropriate departments and agencies form a joint working group or task force to develop psychological policy for an international crisis, event, or a US overseas program. This is an ad hoc group, and policy is determined by consensus.

In peacetime, the US ambassador is responsible for implementing PSYOP policy overseas. In the case of Vietnam, policy was directed from Washington to the US Embassy in Saigon. It was implemented by the Joint United States Public Affairs Office (JUSPAO). More than 60 policy guidance directives were issued by JUSPAO on such diverse topics as 'The Use of Prisoners of War in PSYOP Output,' 'PSYOP Support of Pacification,' and 'PSYOP Aspects of the Refugee Program.' US officials made every effort to develop and promulgate policy directives in conjunction with the Vietnamese government, but such coordination was the exception rather than the rule.

Planning

By definition, a psychological operation is the planned and programmed use of communication media and/or other actions to influence emotions, attitudes, and behaviors of selected target audiences. Planning is the key to psychological operations (random and isolated actions cannot produce consistent results). Planning is essential for psychological operations at all levels-from the strategic and long-range national plan to the PSYOP annex for tactical operations at the battalion command level.

When implemented, the plan becomes the basic instrument and authority for the conduct of psychological operations. One key element in conducting a psychological offensive is the integration of all available assets and their concentration on significant objectives and target groups based on the reality of military, political, or economic operations. The PSYOP plan is the crucial ingredient for integrated and concerted operations. Generally, psychological plans should consist of (1) concept of operations, (2) definition of target groups, (3) clear definition of objectives, (4) general thematic guidance for each objective, (5) injunctions or prohibitions in respect to themes, (6) timetable or schedule to ensure staged and fully orchestrated multimedia operations, and (7) definitive instructions for PSYOP units and assets.

Currently within the US government, there is no central mechanism for the planning of psychological operations. The USIA issues program guidances to its overseas services and divisions. In turn, the United States Information Service (USIS) (overseas) develops country plans which are annual information/cultural programs tailored for a particular country. The Department of Defense (DOD) is responsible for developing psychological plans in support of military contingency operations. Military plans are informally coordinated with the DOS, USIA, and other appropriate agencies.

United States PSYOP planning during the Vietnam period was the primary responsibility of the US Embassy, Saigon. In JUSPAO, the Office of Plans, Policy, and Research was responsible for those plans relating to political, economic, and social programs as well as Republic of Vietnam psychological

operations in support of Chieu Hoi (open arms), pacification, and other programs.¹⁷ On the other hand, the US Military Assistance Command, Vietnam (MACV, developed and implemented plans in support of military operations and selected programs directed to target groups in North Vietnam. Generally, PSYOP plans were coordinated with the Republic of Vietnam through its Ministry of Information and/or the Vietnamese Joint Military Command.

Intelligence

Intelligence is the basis for understanding communications, emotions, attitudes, and behaviors of individuals and groups. Y. Tanaka has proposed a three-step strategy of cross-cultural communication that involves quantitative and qualitative analyses of attitude components within a target population, systematic use of a multichannel and multistep flow of communication, and a strategy in which communication is by deed and words.¹⁸ It is significant that the first step in his strategy is the collection of PSYOP intelligence-the one critical step that is often neglected by the political or military planner.

There are three basic requirements for collecting, collating, and analyzing PSYOP data. First, it is essential that managers and media personnel have a thorough understanding of the psychological aspects of the target audience. Anyone engaged in communication and propaganda programs must have certain information about the audience-background, literacy, preferred languages and dialects, art forms and symbols, and key emotional symbols. In addition, PSYOP personnel should have a thorough understanding of the social, political, religious, economic, and military attitudes that are prevalent in significant population groups. With such knowledge, communication programs can be developed to restructure hostile or negative attitudes, reinforce friendly or favorable attitudes, or reinforce /change neutral attitudes, when appropriate.

The second requirement is for timely and systematic operational feedback. Specifically, information is needed regarding the effort being made to support PSYOP objectives, tasks, and themes aimed at definitive target groups. These

data are essential for analyzing the success or failure of PSYOP programs and strategy.

The third requirement is for timely and systematic feedback from the target audience when a PSYOP campaign is in progress-a substantial task when the full range of communication media is used. A careful and candid analysis is necessary in order to determine which messages and channels of communication worked well and why, what the mistakes were, and what can be done to avoid future errors and failures.

In 1966, a senior foreign service officer of the USIA listed a number of factors that were inhibiting the effectiveness and measurement of PSYOP programs in Vietnam.

- 1. We "fly by the seat of our pants" both in setting goals and measuring our success.**
- 2. Our assessment is superficial because we are not experts and because reporting requirements tend to emphasize deeds and statistics and not attitude, opinion, and behavior change.**
- 3. USIA is oriented more to media than to audience.**
- 4. We deal too frequently with accidents rather than essences, which leads to confusion of ends and means.**
- 5. There is a basic lack of research data.**
- 6. We attempt to change rationally attitudes that are basically emotional.**
- 7. We are often confused by changing goals in the field versus our long-range basic mandate.**
- 8. We lack orientation toward communications as a whole and communications research in particular.**
- 9. There is a communications gap between Washington and the field, between media product and field need.** ¹⁹

Weaknesses in measuring the effect of USIA programs were stated by another senior officer.

- 1. The system is too simple in theory and too unclear in practice.**
- 2. Our objectives are very broad, our specific knowledge very narrow. While we can never have all the knowledge we need, we can narrow the gap in some respects.**
- 3. Much basic data on which to base evaluations is missing; e.g., the extent to which messages are directed to**

target audiences, whether the messages are received, and whether they are understood.

4. There is at present too little operational research directed at the question of results.

5. Too much evaluation is being done by operators themselves. The evaluation is therefore subjective.

6. In the rush of day-to-day business, the hard questions are often postponed indefinitely.²⁰

No single government agency is responsible for the systematic collection of PSYOP intelligence. The Office of Research in the USIA sponsors ad hoc research and conducts some overseas field surveys in order to evaluate selected media output. Intelligence specialists in the Bureau of Intelligence and Research (Department of State) are primarily interested in political information. In a similar vein, the Defense Intelligence Agency is principally interested in the collection and analysis of "hard" military intelligence such as order of battle and weapon systems data. US Army PSYOP intelligence teams generally do not possess the resources or the scope of knowledge required to evaluate the psychological environment of potential target groups around the world.

In Vietnam, as during the Korean War, an attempt was made to overcome PSYOP deficiencies in intelligence by sponsoring ad hoc studies and surveys. However, PSYOP intelligence requirements do not lend themselves to ad hoc or temporary measures: The problem is operational, it is dynamic, and it requires constant attention by professionals who are a permanent part of the team.

A computer-oriented system is being developed by the US military to correct some of the inadequacies in PSYOP intelligence, especially in appraising the success or failure of propaganda programs. This system, known as the PSYOP Automated Management Information System (PAMIS), will be discussed in subsequent sections of this essay.

Operations

Within the US government, the USIA is responsible for educational, cultural, and informational programs and

operations overseas. Its operations in Washington (for overseas audiences) include a broadcast service (primarily the "Voice of America"); information center services that support overseas exhibits and information centers; a motion picture and television service that prepares films and audio tapes for release overseas; and a press and publication service that prepares and distributes magazines and other printed matter to overseas posts. Most of USIA's day-to-day operations are the responsibility of the USIS,²¹ which is a part of the US overseas mission. The organization and activities of the USIS are dependent on various protocols and agreements between Washington and the host nation.

The US military services have their own PSYOP units and, when authorized by the president, can support USIA operations overseas. Military PSYOP units are composed of various teams that can be put together to accomplish specific missions and functions. US Army PSYOP responsibilities include propaganda development, audio visual production, research and analysis, graphics production, printing, radio operations from mobile studios and transmitters, and loudspeaker operations.

In Vietnam, US military PSYOP favored an organizational arrangement that heavily involved the USIA. JUSPAO was established in Saigon in May 1965, a result of the National Security Council directive. JUSPAO was a PSYOP command supported by USIA, DOD, and USAID (US Agency for International Development). The director of JUSPAO (minister/councillor to the ambassador) issued policy directives (to both military and civilian agencies) and conducted the full range of strategic and tactical operations. At its peak JUSPAO was composed of about 250 US officers, more than half from USIA, and about 600 Vietnamese employees. Within the staff of MAC V was the Psychological Operations Directorate, a separate staff section that was later put under the operations chief, the J-3. The military also had operational control of a large PSYOP field unit-the Fourth PSYOP Group. Additional support was available from the Seventh PSYOP Group, which was located on the island of Okinawa.

Programs and Operations

While it is true that Vietnam represented the largest post-World War II American venture into psychological operations, the magnitude and breadth of the US effort there makes Southeast Asia an atypical example of American communications programs-even if a rich source of perspectives.

The major continuing US effort in this field is that of USIA, including the VOA.²² Through periods of attention to and neglect of military PSYOP, USIA has been the principal²³ channel of American communications to foreign audiences.²⁴ The USIA was significantly affected by the detente in US-Soviet relations; for example, its once- anticommunist rhetoric has become anachronistic. Its other functions in information dissemination and cultural exchange have withstood the passage of time far better. This is hardly surprising, since persuasive communications have marginal value as opinion changers but are much more effective in attitude reinforcement.²⁵

Pre-Vietnam

Specific efforts mounted by US psychological operations before Vietnam include, most prominently, campaigns in Lebanon (1958,²⁶ 1962²⁷) and the Dominican Republic (1965²⁸), and American efforts concerning Africa also grew after about 1960. Throughout the entire period, "Radio Free Europe,"²⁹ "Radio Liberty,"³⁰ "Radio in the American Sector" (Berlin),³¹ and other propaganda outlets were directed toward the USSR and Soviet-dominated areas.

The evolution of the postwar world left the United States, notwithstanding its early history and national values, in the position of the world's most important status quo power.³² American international communications were therefore generally antirevolutionary, frequently supporting unpopular regimes in the name of stability.³³ In some cases (e.g., Lebanon) the programs were reasonably effective, but psychological effort success is difficult to separate from the nature and success of the overall political or military activity.

Vietnam

The importance and priority that the North Vietnamese and Vietcong (VC) put on psychological operations are well known, as in the slogans "Political activities are more important than military activities," and "Fighting is less important than propaganda." Vo Nguyen Giap in his *People's War, People's Army* quotes as one of Ho Chi Minh's cardinal principles of political warfare, "Do not attempt to overthrow the enemy but try to win over and make use of him."

As noted above, in 1965 JUSPAO was established to coordinate the US policies and personnel involved in psychological operations. A major portion of the new US PSYOP effort was to be devoted to the Chieu Hoi returnee program (an attempt to win over and make use of the VC). There was to be optimum coordination and integration of both US and Vietnamese operations at all levels, with overall supervision from JUSPAO and the Republic of Vietnam Ministry of Information (MOI) through the Vietnam Information Services vested in a combined US-Vietnamese coordinating committee at the national level with representation from MACV, JUSPAO, General Political Warfare Directorate (GPWD), and MOI.

"Guidelines to Chieu Hoi Psychological Operations: The Chieu Hoi Inducement Program" was prepared in April 1966 by JUSPAO. It centralized policy planning and decentralized operational planning. Execution was assigned to the local level. Development and mass production of PSYOP materials were done by JUSPAO in accordance with tactical needs determined by the field. In addition to JUSPAO, MACV (the 4th US Army PSYOP Group) operated an extensive program, much of which was devoted to the Chieu Hoi inducement program.^{34, 35}

Content of PSYOP material, targeted on the potential rallier, was focused on his grievances, emotions, and aspirations-not on ideological commitment (except in the case of hard-core VC). The insurgent was encouraged to return to his home by the creation of trust in the government as just and generous. Former insurgents were used in preparation of the material to the maximum extent possible-they, rather than the Americans, knew the modus operandi of the enemy and were a part of the indigenous culture.

The leaflet-distributed from aircraft and by hand-proved to be the most practical means of disseminating the Chieu Hoi message. The ubiquitous "safe conduct pass," which literally blanketed South Vietnam, was probably the most effective message. Though there were thousands of other leaflets stressing many other themes,³⁶ the safe conduct pass was most often described by ralliers during interrogation as the one most seen and the one most conducive to rallying. After one battle, 90 percent of those VC who could be searched-the dead, wounded, and captured-had the safe conduct leaflet.³⁷ By the spring of 1971, JUSPAO had distributed nearly four billion leaflets in the campaign to persuade "men to rally to the GVN [Government of the Republic of Vietnam] under its amnesty program."³⁸

No discussion of the factors motivating defection is complete without mention of the carefully structured program of rewards given to those who rallied and indeed even to those who influenced a VC to rally. The Chieu Hoi weapons reward program paid a returnee for weapons he turned in or for weapons that he was able to recover after he rallied. This program was successful in locating large weapons caches. The weapons reward system was established by official decree of the Chieu Hoi Ministry of the GVN.

The Vietcong military forces neutralized through the Chieu Hoi program were equal to about one-fifth of the total of all their forces killed or captured by military action. More than 4,000 men from the government of the Republic of Vietnam or its allies would have been required to effect the same result through military action.³⁹

Besides the safe conduct leaflet and rewards program, testimonials from Hoi Chanh (former VC) proved to be effective in the total psychological process of attitude change. It was determined that the Hoi Chanh testimonial should contain four essential elements: a photograph and complete individual description of the Hoi Chanh; an indication of why he rallied; discussion of the good treatment he received; and an appeal to his former comrades to rally. Experience in the field showed that when a PSYOP person wrote a testimonial message for a Hoi Chanh, it was usually recognized as propaganda. The best approach was for the Hoi Chanh to address his message

specifically to his former unit and address some of his former comrades by name. He should tell enough about himself to convince the recipients of the message that he is in fact alive and well. The operative word in all Hoi Chanh testimonials was credibility. Themes were suggested to the returnee, but the language was his own. In many instances, audio tapes were prepared of Hoi Chanh testimonials for broadcast by air-to-ground loudspeaker systems and radio.

Poetry, music, and art were effective PSYOP media directed to hostile as well as friendly target groups. The messages were emotional in tone and concerned such time-tested themes as love, family, religion, home, holidays, and national heroes.⁴⁰

It became apparent as a result of operational experience that direct psychological operations, aimed at modifying attitudes and behavior, must be preceded by propaganda that is indirect in character, slow and general in nature. It should seek to create an atmosphere of favorable preliminary attitudes. No direct psychological operations can be effective without a proper foundation. Safe conduct passes and testimonials are one type of foundation; that is, they inform the enemy soldier that if and when he decides to surrender, certain protocol will be observed. The best psychological operations involve face-to-face persuasion. The following example of PSYOP messages being reinforced by face-to-face persuasion was provided by a former deputy leader of a VC surgical team who was also a Communist party member.

The Chieu Hoi leaflets were dropped by airplanes very often. I read some of them . . . At that time I didn't really believe in the leaflets because I was told by the cadres that the government wanted to cheat Front people by its Chieu Hoi program. Although I didn't believe what the leaflets said, I had something in my mind about leaving the Front. When my friend, Mr. Thiet, came to tell me about the government's treatment toward the ralliers, I believed him. I believed that I wouldn't be beaten up by the GVN as the cadres had said, because my friend was one of the ralliers, and he wasn't beaten up or punched down into the sea. [This refers to VC claims that GVN troops took the Hoi Chanh up in a helicopter and then threw them into the ocean.] On the contrary, he was well-treated by the government. He was given a job, and he was free to visit his family when he wanted.⁴¹

Another type of foundation used in an insurgency environment was a magazine disseminated in Vietnam called *Long Me*.

The primary target audience for the magazine was the families, friends, and sympathizers of the VC. The 62-page, full-color magazine was distributed bimonthly to villages and districts known to be sympathetic to the VC. It was distributed by priests, merchants, school teachers, bus drivers, fortune tellers, armed propaganda teams, and others. Long *Me* was also distributed through direct mail. It contained feature stories, poems, short novels, cartoons, and art. The feature stories were factual, and they emphasized the positive features of the new life offered to former VC. Long *Me's* indirect approach worked well. The staff of Long *Me*, with the exception of one American (Philip Katz), was composed of former communist propagandists.

Not all propagandists in Vietnam believed in the slow and indirect approach. Many messages were harsh, explicit, and direct; for example, this leaflet was prepared and disseminated by an American military unit:

The sky soldiers of the US 173d Airborne Brigade are here to destroy you. We have killed hundreds of your comrades with our powerful bombs and artillery and invincible ground troops. You will die a senseless death and be buried in an unmarked grave in an unknown jungle. Rally now before it is too late.

Propaganda must be continuous and lasting-continuous in that it must not leave any gaps in logic and continuity of themes, lasting in that it must function over a period of time. The principle of repetition plays an important role in persuasive communication.

PSYOP is not magic; effective communication is based on slow and constant impregnation. PSYOP is not a stimulus that disappears quickly; it consists of successive messages and actions aimed at various emotions or thoughts through many instruments of communication. Effective psychological actions should be continuous; as soon as the effect of one message is weakened, it should be reinforced by another.

Post-Vietnam

After the conflict in Southeast Asia, the United States once again moved away from systematic, coordinated psychological operations on a government-wide scale. As in the past, military

human resources for PSYOP were reassigned or neglected. The USIA had no intensive focus, and USIA efforts were only marginally coordinated with other US persuasion programs. The lessons of the past concerning the potential value of PSYOP, the importance of coordinated, systematic planning, and the value of continuous communications as facilitator (even during periods of strategic security) were once again ignored.⁴²

Effectiveness

Probably the most elusive single area in the analysis of psychological operations is the evaluation of PSYOP effectiveness. How can effectiveness be measured? Polling dominates much of our political life, and market research is considered fundamental to sound business practices; yet PSYOP operates in an anachronistic world where direct audience analysis is often impossible.

Effectiveness of persuasive communications is generally viewed in terms of the degree to which attitudes are changed or reinforced. However, studies have conclusively demonstrated that PSYOP directed at denied or hostile areas should aspire to modify peripheral attitudes only, not fundamental ones.⁴³ Our government's persuasive communications to foreign audiences enjoy very limited parameters of only potential effect.⁴⁴

The relatively small range of impact and the difficulty of measurement are primary constraints in the evaluation of effectiveness. The fundamental question is, how successful are the communications in terms of the limited objectives? Sometimes, however, practitioners have been forced into a secondary question: Assuming the general principles we have identified to be optimum, to what degree are the communications congruent with them?

Another major impediment to effectiveness assessment is the nonpersuasive nature of psychological operations. One is inclined to think in terms of the critical message directed at the critical audience at the critical moment. In fact, the vast majority of propaganda and other instruments of PSYOP consist of what L. John Martin has called facilitative com-

munication (*not* persuasive communication).⁴⁵ That is, PSYOP is designed to keep the lines open-maintain the channel and its credibility-in *preparation* for the critical movement, message, and audience. Since the purpose of the messages sent in facilitative communication is *not* persuasive, how do we measure their effectiveness? To what extent should the two types of communication, which are purposively related but conceptually discrete, be evaluated by a single measure?

If we could select our audience on the basis of certain idiocratic factors-objective physical and personal characteristics peculiar to an individual, such as age, sex, race, education-we might increase by a statistically significant fraction the proportion of those influenced by a message. But we would have no control over such factors as personality and susceptibility to persuasion, existing values, beliefs and opinions or attitudes toward the objects, subjects and situations involved in the persuasive message. We can choose our communicator but not determine his image. We can select the vehicle of transmission but not the channel of reception of the target of our communication. We could maximize the effect of all these factors for a single individual, especially if we were able to subject him to intensive precommunication analysis. But there is no way that this can be done for the diverse assortment of individuals who normally make up the audience of the mass media, the vehicles most commonly used in international propaganda.⁴⁶

For lack of a criterion,⁴⁷ as well as for the inability to secure direct access to the audience and the recognition of the inherent limits of persuasive communications, the most common evaluations of effectiveness have been output measures, despite their notorious limitations.⁴⁸ A second approach has been to focus on reception, in general, this area has not attracted much attention. The final type of analysis-effects measures-may be both direct and indirect.

Direct measures of effects can involve the use of polling or survey data. In peacetime, such information can be gathered in interviews with traveling foreign nationals,⁴⁹ direct mail questionnaires, and polling in the audience's country. In war, or when relations between the sender (source) and receiver (audience) countries are strained, only some-or none-of these may be practicable. In these cases, refugees⁵⁰ and prisoners of war⁵¹ have been used to gather effects data. However, such groups often have inherent disadvantages as a population-they may not be a representative sample, and

identification of the role of any individual message in their decision to defect is usually elusive.

Indirect measures include the content analysis of intercepted mail, mail drops,⁵² captured documents, broadcasts and telecasts, and target area public media.⁵³

Trends

In an effort to institutionalize PSYOP intelligence, the US military designed and developed a computer-oriented system called PAMIS. This information system was designed to fulfill several objectives: (1) to provide the spectrum of information needed to support PSYOP organizational elements for the planning, implementation, and evaluation of PSYOP programs; (2) to encourage (indeed, to enforce) methodologies to support information-gathering programs; and (3) to provide an appropriate automatic data-processing system for the storage, analysis, and utilization of the gathered data.

PAMIS encompasses these three systems:

Foreign Media Analysis (FMA) System,⁵⁴
 PSYOP Foreign Area Data System (PFAD),⁵⁵ and
 PSYOP Effects Analysis System (PEAS).⁵⁶

The primary objective of FMA is to provide statistical data obtained from publications and radio broadcasts of selected foreign countries. The data collected includes information about their propaganda objectives and strategy; propaganda themes used to support these objectives; propaganda trends; the tone and intensity of media coverage related to domestic themes, foreign governments, international organizations or political movements; and propaganda techniques and tactics. Another FMA objective is to provide clear-text abstracts on important events, subjects, and persons as they are treated in the public media of the selected countries.

The objective of PFAD is to provide the US military PSYOP community with uniform methods and procedures for the collection, storage, and rapid retrieval of data needed for planning and operations. The PFAD was designed to accomplish the following tasks:

- define parameters for the collection of PSYOP-relevant data;
- provide uniform procedures and methods for collecting and reporting such data;
- provide a retrieval system that has a centralized data bank, the core of which is a set of over 1,600 foreign area data descriptors, and that permits retrieval of two types of reports: annotated bibliographic material and narrative summaries of subject data; and
- provide for continuous and rapid updating of PSYOP foreign area information.

The computer system provides the PSYOP community with social, cultural, economic, political, communication, and other information that is needed to make decisions on aspects of PSYOP policy, planning, allocation, and deployment of resources and operations.

PEAS was designed to collect, store, and process data from a sample of a target audience in order to measure the success or failure of PSYOP messages and programs. The system also stores and processes data about friendly and hostile PSYOP activities and actions. Timely, accurate reporting on the purpose (objectives and tasks) of friendly PSYOP programs is essential, as are facts about the distribution and intensity of efforts expended on specific target audiences. Although hostile PSYOP activities and actions usually do not directly affect friendly messages, systematic monitoring of hostile propaganda and other actions provides analysts with many clues about how enemy elites react to our PSYOP programs. In fact, when respondents from the target population (such as prisoners, defectors, and refugees) are not available, the content analysis of hostile media can be the most valuable source of feedback concerning the impact of friendly programs.

A significant objective of PEAS is to institutionalize methods and procedures for analyzing PSYOP programs and strategies so that the successes and failures of strategic and tactical programs can be measured. PEAS was therefore designed to provide the following:

- **uniform (institutionalized) procedures and methods for reporting and describing all PSYOP activities in a theater of operations;**
- **rapid retrieval of command and control data to determine how effort and cost relate to objectives and tasks;**
- **the data necessary for analysts to correlate operational data with specific military target groups and segments of the civilian population;**
- **data for a continuous evaluation of the initial impact of PSYOP messages (audio and print) directed to general or particular target groups;**
- **uniform procedures and methods for reporting and analyzing hostile propaganda and action directed to friendly military and civilian populations; and**
- **data needed for an independent audit and assessment of military PSYOP by the joint or other appropriate command.**

To accomplish the above, PEAS was designed to accept, store, and process data inputs into three computer files.

The ACTH file of PEAS was designed to institutionalize the reporting of military psychological activities at each command level. This reporting system provides commanders with systematically collected data for command and control of the full range of PSYOP activities. Specifically, the ACTIV file provides information about the quantity of effort being directed in support of specific programs or campaigns, in support of PSYOP objectives, tasks, and themes, and toward definitive target groups. In addition, this file provides information about the amount of effort allocated to each channel of communication (such as print, radio, and loudspeaker). Also available is information about psychological actions such as show of force, exploitation of new weapons, and supply drops.

Much basic data is needed for making evaluations: To what extent are our messages directed to specific target audiences? What are our objectives? Are our messages received and understood? PEAS will provide many answers to these questions.

The IMPACT file of PEAS was designed to institutionalize the collection of data about the effect of specified propaganda messages, activities, and programs. The data collection format

was designed to be manageable for prisoner of war or other interrogations at any level of command. Each IMPACT computer record pertains to a respondent's (such as POW) reaction to an electronic or printed message or action. In the first step (of the interrogation process), the respondent is required to select from a catalogue of PSYOP messages that he has seen or heard. The IMPACT data record is then completed for those messages identified by the respondent.

It is beyond the scope of this essay to present the details for the multitude of inputs and outputs of the ACTIV file of PEAS, but both quantitative (statistical) and qualitative (textual) reports are available to analysts and other users of the system. These reports provide gross information related to four indicators of PSYOP impact.

- **Understanding:** Did the audience understand the language and symbolism used in the message?
- **Credibility:** Was the content credible, or did the audience view the message as obvious propaganda?
- **Influence:** Did the message influence the respondent to act in a way favorable to the sponsor of the message?
- *Irritation:* Did the language, symbolism, or other aspect of the message irritate the audience?

Statistical analysis of such data should reveal the specific themes and messages that were successful; it should also reveal those messages that failed. In addition, PEAS should provide analysts with a generous number of textual responses, in the respondent's own words, that explain the reasons for both success and failure.

PEAS will provide military commanders with the range of information needed to evaluate the impact of psychological operations. No longer will number of leaflets produced or hours of broadcast time be the only-or even the basic-criteria for evaluating PSYOP programs.

The POLWAR file of PEAS provides uniform procedures and methods for reporting and analyzing hostile propaganda and action directed to US military-and other friendly-populations. Data from this file allow for the continuous monitoring of hostile POLWAR activities at the tactical command level. It is this file of the PEAS that interfaces with the FMA system. The

POLWAR file is concerned with those communications, propaganda, and actions that take place in a combat environment and are directed at friendly military and civilian audiences. This contrasts with the **FMA** system, which is concerned primarily with strategic objectives and which deals with data obtained from newspapers, magazines, and radio broadcasts directed to their own domestic audiences.

Conclusions

Tanaka's concept of cross-cultural communication, noted above, emphasized the systematic use of multichannel, multistep flow* of communication, and a strategy in which communication is by both deed and word.

Propaganda must be total. A modern psychological operation must utilize all of the technical means at its disposal-the press, radio, TV, movies, posters, meetings, and face-to-face persuasion. There is no psychological operation when meetings and lectures are sporadic, a few slogans are splashed on walls, radio and television presentations are uncoordinated, and news articles are random. Each communication medium has its own particular mode of influence-alone, it cannot attack individuals, break down their resistance, or make their decisions for them. A film does not play on the same motives, does not produce the same feelings, does not provoke the same reactions as a leaflet. The very fact that the effectiveness of each medium is limited to one particular area clearly shows the necessity of complementing it with other media. A word spoken on the radio is not the same as the identical word spoken in private conversation or in a public speech. Nor does a word appearing in print produce the same effect as the same word when it is spoken. To draw the individual into the net of persuasion, each technique must be utilized in its own specific way, directed toward producing the optimum effect, and orchestrated with all the other media. Each medium reaches the individual in a specific fashion and makes him react anew to the same theme-in the same direction, but differently. Thus, no part of the intellectual or emotional personality is left alone.

Effective totalitarian regimes have a clear understanding of the psychological aspects of military actions. These regimes

employ propaganda for psychological impact every day, and propaganda is fully institutionalized within the political and military structure of these states. Furthermore, these regimes are sensitive to the psychological environment of their target audiences and are able to orchestrate the various instruments of communication to promote unity in their own ranks and unity with their own people while promoting divisiveness in enemy forces.

As a democracy, the United States has tried to renounce domestic propaganda; as a nation in a highly competitive political world, America must use psychological operations. As yet, however, the formula that would support both these aims without their working at cross-purposes has not been found—a fact made quite evident by the awkwardness that characterizes US PSYOP efforts at home and abroad.

Psychological operations can be among the most suitable and effective weapons in pursuit of US national objectives in this unstable and sometimes threatening world. PSYOP exploits military readiness already required for other purposes without requiring the use of military force. It draws power from the strength of Western democracy and the universals of civilization. It can encourage masses of people to develop untapped natural resources and to oppose totalitarian regimes.

The requirements for effective psychological operations are considerable. Modern persuasive communication is not a haphazard, hit-or-miss activity but a well-coordinated, sustained effort. It demands a broad and thorough knowledge of a wide variety of psychological, sociological, and cultural factors. It also requires planning well in advance of events. It must, at all times, serve under an appropriate form of centralized direction with trained personnel and dedicated resources. Contemporary psychological operations is not an amateur's game.

Notes

1. This definition is adapted from Joint Pub 1-02, *Department of Defense Dictionary of Military and Associated Terms*, 1974. *Psychological operations* is a broader term than *psychological warfare* in that it deals with friendly and neutral, as well as hostile, audiences.

2. See R. J. Barret, "PSYOP: What Is It?" *Military Review* 42 (1972): 57-72. For an excellent study of the dynamics of international perception, see Robert A. Jervis, *Perception and Misperception in International Politics* (Princeton, N.J.: Princeton University Press, 1976).

3. Harold D. Lasswell, "The Structure and Function of Communication in Society," in L. Bryson, ed., *The Communication of Ideas* (New York: Harper and Row, 1948).

4. Indeed, the four principal figures in the establishment of communications research-the fundamental PSYOP root-were two psychologists (Paul Lazarsfeld and Carl Horland), a sociologist (Kurt Lewin), and a political scientist (Harold Lasswell).

14. Tanaka, 50-54.
15. In the summer of 1942 Russian Lt Gen Andrei A. Vlasov was captured by the Germans. The Germans soon learned that Vlasov wanted to lead a Russian national army of liberation into the Soviet Union. General Vlasov (a Russian military hero) was willing to collaborate with the Germans for the sake of Russian national independence. Hitler, however, saw Vlasov at most as a tactical propaganda tool to weaken the Soviet forces: "promises might be given to him and deserters who came over to join him (the Vlasov movement), but on no account should these promises be kept."
16. R. Gehlen, *The Service: The Memoirs of General Reinhard Gehlen* (New York: The World Publishing Company, 1972), 84.
17. The Chieu Hot program was the campaign to encourage "ralliers" (Hot Chanh) to come over to the Republic of Vietnam side. Only South Vietnamese NO were eligible. Substantial publicity was given to the act of "rallying"—to the motivations and aspirations of the Hot Chanh, the benefits of rallying, and the like.
18. Tanaka.
19. US Information Agency, *Proceedings of the Seminar on Effectiveness*, R-121-66 (Washington, D.C.: Office of Policy and Research, 1966).
20. Ibid.
21. The agency responsible for programs and operations is USIA; the overseas posts are USIS posts, and they form an integral part of the US country team headed in each country by the chief of mission, usually an ambassador.
22. There have been many proposals over the years to sever VOA from USIA, but for the present the tie remains.
23. Other US institutions principally involved on a continuing basis include the National Security Council, the DOS, the Agency for International Development, and the DOD.
24. A major source on USIA is J. Henderson, *The United States Information Agency* (New York: Praeger, 1969); M. G. Lawson et al., *The United States Information Agency during the Administration of Lyndon B. Johnson, November 1963-January 1969* (Washington, D.C.: Government Printing Office [GPO], 1968) is an administration history of some value in understanding USIA. T. Sorenson, *The Word War* (New York: Harper & Brothers, 1968) gives an excellent overview of the problems and competing principles with which such an agency must deal. A more critical, briefer, but equally stimulating presentation is K. R. Sparks, "Selling Uncle Sam in the Seventies," *The Annals of the American Academy of Political and Social Science* 398 (1971): 113-23.

PART III

Strategic, Tactical,
and Operational PSYOP

THIS PAGE INTENTIONALLY LEFT BLANK

Introduction

This section deals with the objectives and activities of strategic, tactical, operational, and other types of PSYOP. In all forms, PSYOP primarily supports the attainment of national policy and objectives. The key to all US PSYOP is credibility of the message. Evaluation is based on changing perceptions, attitudes, and behaviors.

Certainly, the ideology of a government plays a role in its PSYOP methodology and its international communications. The authors offer articles about Soviet PSYOP campaigns and activities with a credibility/ disinformation perspective.

DeWitt S. Copp discusses Soviet active propaganda measures, including forgery, agents of influence, and disinformation. His discussion serves as a historical summary of Soviet campaigns and ideology.

James Melnich emphasizes mirror imaging in Soviet propaganda. His essay is useful in understanding the overall Soviet PSYOP threat and possible related weaknesses.

Lev Yudovich reveals the significant threat and impact of the Soviet military doctrine of cultivating hate in their soldiers. This doctrine was designed to make Soviet soldiers psychologically prepared to act in dangerous situations and to believe in victory.

Dr Joseph S. Gordon focuses on research, target analysis, pretesting and effects analysis, and propaganda analysis. He concludes that intelligence activities are critical to PSYOP.

George V. Allen, former director of USIA, states that we must be realists and understand that a combination of political, economic, psychological, and military efforts are necessary. He believes that propaganda alone in the short run can do little to solve problems. Allen advocates an honest, objective, and truthful information program that faithfully relies on the individual to make right decisions.

Lt Col John Ozaki, USA, addresses the planning and coordination of successful defector programs as another form of combat power. He emphasizes the characteristics and techniques of a sound program to defeat insurgency movements.

Ronald D. McLaurin emphasizes that PSYOP at the tactical level can contribute to the major strategic objectives of a government and a reacquisition of the loyalty and support of the population.

Benjamin F. Findley, Jr., reviews and analyzes selected US and Vietcong PSYOP in the Vietnam War.

Soviet Active Measures

DeWitt S. Copp

Although Vladimir I. Lenin did not coin the term *active measures* (*laktivnee meropriyatia*), he originated and set in motion all its component parts. Those parts included the International Department (ID) of the Central Committee of the Communist Party of the Soviet Union (CPSU), Section A of the first chief directorate of the KGB, and the propaganda department (PD) of the Central Committee.

The ID is the coordinating center for Soviet active measures. Its lineage can be traced directly to Lenin's formation of the Comintern in 1919. Lenin's purpose for the Comintern, or Third International, was to advance the cause of global revolution by forming communist parties in noncommunist countries and creating conditions for revolt through propaganda and agitation. The approach was adaptable to political realities.

The International Department, formed in 1957, was a sophisticated apparatus at the summit of Soviet power. It carried the view of the leadership, bringing influence to bear on any area-political, military, or economic-that would aid or abet Soviet policy. At the same time, it sought to denigrate and undermine the policies of the noncommunist world, particularly those of the United States. More politically realistic than its Leninist ancestor, the ID's purpose was to manipulate public opinion and gain the acceptance of Soviet ends. The ID's secretary was Anatolii F. Dobrynin, who had served as Soviet ambassador to the United States for 24 years. He was appointed to his post by Soviet General Secretary Mikhail S. Gorbachev in June 1986, several months after the important Twenty-Seventh Congress of the CPSU.

The ID worked closely with the propaganda department, headed by Party Secretary Aleksander N. Yakovlev, who had served for 10 years as Soviet ambassador to Canada.

The propaganda department employed dual courses of action. It orchestrated the line of the party, utilizing Soviet and bloc media, and overtly replayed disinformation generated by the active measures apparatus. Since the PD embodied the former international information department of the Central Committee of the CPSU, it covered both the Soviet home front and the foreign scene.

One of Lenin's first acts on seizing power was to establish the Cheka, dr secret police. He knew that without such an instrument of fear, his movement could not expect to survive. That circumstance did not change, but the Cheka became the KGB-and its activities were worldwide!

Section A of the KGB's first chief directorate worked in liaison with the ID in carrying out covert Soviet active measures. These efforts included disinformation operations, the placement of forgeries, and the managing and directing of knowing and unknowing agents of influence-professionals in sensitive positions, both private and public-whose activities were frequently of great value in the Politburo's plan to gain acceptance of its position on major issues.

Together, the ID, the KGB, and the PD were the architects and planners of Soviet active measures. With an estimated annual budget of \$4 billion, their combined efforts were a major force in the mechanics of Soviet foreign policy.

Stanislav Levchenko, a former major in the KGB, was acting director of line PR of the Soviet active measures group in Tokyo when he defected to the United States in 1979. In his 13-14 July 1982 testimony at the Hearings before the Permanent Select Committee on Intelligence, House of Representatives, he gave the following appraisal.

The size of the overt and covert active measures is massive ... I can tell you from an insider's vantage point that the ID and the KGB receive all the resources and personnel needed to carry out this massive effort. There are never any shortages. Of course, this is not a recent development. An examination of the history of the CPSU will demonstrate the importance of such tactics . . . all active measures operations are assessed against a set of standards. Success is a vital

ingredient. The growth of the Soviet active measures effort over the last five to ten years is due to progress in the field.

Forgeries

Soviet active measures were carried out within a spectrum of white (overt), gray (semicovert), and black (covert) operations. It was in this last area that the crafting and placement of forgeries was conducted by section A of the first chief directorate of KGB. KGB's management of forgeries was global, and was linked to the use of Soviet assets in whatever locale the particular forgery was to be surfaced. The KGB's purpose in placing forgeries was to undermine US relations with allies and nonaligned governments and to influence public opinion against US policies concerning sensitive issues. An additional purpose was to convince those affected by the impact of the forgery that decisions announced by the United States cannot be believed because underlying them were secret plans that were harmful in their implication and intent.

For example, an obscure French-language weekly newspaper in Madagascar-Carrefour (Crossroads)-carried on its front page (summer 1985) a purported letter from a US Army medical doctor at Walter Reed Research Institute written to a supposed superior at the Pentagon. The substance of the forgery indicated that US and South African scientists were secretly working on psychotropic chemical weapons and so-called ethnic weapons that would kill only black-skinned people.

The forgery contained numerous technical errors, and its falsity was quickly exposed by the United States Information Agency (USIA). However, this did not stop Tass (the Soviet official news agency) at year's end from running the forgery as a true account. Tass lifted it from Krasnaya Zvezda (Red Star), the official publication of the Soviet Ministry of Defense, under the headline "Sinister Plans."

The purpose of the forgery was to instill and spread the belief that the US government is vicious, racist, and scientifically willing to pursue inhuman ends. That KGB effort to arouse black Africa failed-the forgery was not picked up by other African newspapers and outlets. However, one of the basic

consistencies of the active measures apparatus was that of repetition. A lie once told is never discarded, no matter how thoroughly exposed. In June 1987, in a meeting with USIA Director Charles Wick, who was in Moscow for the opening of a USIA cultural exhibit, the director of Novosti repeated the ethnic weapon lie. Wick walked out of the meeting. Novosti, a supposedly independent Soviet news agency, is heavily staffed by the KGB.

The KGB made a practice of attacking US scientific and medical activities on a broad scale, employing not only forgeries but also disinformation by clandestine radio stations. One such KGB effort was mounted through "Radio Halgan," operated by a communist-front group of Somali dissidents in Addis Ababa, Ethiopia. The station reported that the president of Somalia was negotiating with the US commander of Central Command to lease Somali territory near the border of Kenya to bury US nuclear waste in exchange for a large aid program (\$400 million). This completely false broadcast was quickly reported (as straight news) by newspapers in Kenya as well as by the AP and other wire services, which replayed the message as far away as Rome and Vienna.

In spite of US proof that no such meeting ever took place (the president of Somalia was out of the country at the time) and the fact that the US does not bury nuclear waste anywhere outside its own borders, the account took on a distorted life of its own. The false story, which was reprinted in numerous publications throughout Africa, produced this headline: "Africa a Global Dustbin for Nuclear Waste."

Soviet active measures operations, using forgery and disinformation, ran the gamut from clumsy and crude to sophisticated and clever. One example of the latter bore the unique distinction of being a double forgery.

The point of attack was Cyprus. The intent was twofold: to damage US-Greek Cypriot relations and to instill fear in the minds of the European public regarding US and NATO plans.

The KGB target was the Greek Cypriot newspaper *Simerini*. A document came into its possession, supposedly forwarded by a Cypriot official who, in turn, had purportedly received it from a British MP, Sir Frederic Bennett. His letter to an unnamed official was a forgery: "Your Excellency, I have received a letter

which contained [sic] information about your country. Since I am not an expert on the problem of the area in which your country is located, I have decided to write to you and enclose the attached letter." The attached letter appeared on the front page of *Simerini*. It, too, was a forgery. Its author was supposedly the US Air Force vice chief of staff, who was allegedly writing to US Secretary of Defense Caspar W. Weinberger, on an urgent matter. The matter concerned the US use of bases in northern Cyprus under Turkish occupation for intended operations in the Middle East. Also, and most importantly, it concerned the evacuation of US soldiers and their families and other US citizens in case of nuclear war in Europe. The forgery elaborated on the deployment of US nuclear weapons in Europe and their possible use in support of the president's strategic schemes.

Swift action on the part of USIA P/G, USIS Nicosia, and Sir Bennett exposed the double forgery for what it was. Its publication and *Simerini's* failure to write a retraction undoubtedly had a very negative effect upon Greek Cypriots who accepted the forgery as valid, but it did not gain European press attention.

To the KGB, a forgery's failure to attain the full effect in no way impeded the continuing attack. Was the forgery's purpose to convince Latin Americans that the US was plotting with Chile to inject Chilean troops and weapons into Central America? Was the purpose to disrupt the first legitimate elections in Guatemala in 30 years by indicating US manipulation and control of the election's outcome? Was its purpose to sway the Indian public into believing that the CIA was responsible for the assassination of Prime Minister Indira Gandhi? Or was its purpose to "get away with" the murder of 269 KAL passengers by claiming that the civilian airliner was on an espionage mission?

Perhaps the forgery's purpose was all of these; in any event, the work of Section A of the KGB's first chief directorate continued without letup. Its endeavors apparently were not moderated in any form by the new spirit of Geneva or by glasnost.

Agents of Influence

Of all Soviet active measures, the most effective and the most difficult to expose was the KGB's utilization of agents of influence. Agents of influence were individuals who, either knowingly or unknowingly, sought to implant Soviet policy positions into decisions made by international organizations (such as the UN) and governmental departments. They also sought to influence congressional actions, public beliefs, and national attitudes concerning world affairs. A case in point is the former senior Norwegian government official, Arne Trehold, who frequently represented his government in negotiations with the Soviets. In June 1985, Trehold was convicted of espionage; he had been a known KGB agent of influence from 1974 to 1983.

Obviously, exposing such agents was a difficult task. At times, there were 700 Soviet diplomats assigned to West European posts. Additionally, 570 Soviets were attached to UN organizations in Europe and 1,200 Soviet bloc diplomats were serving overtly in similar capacities. Finally, and perhaps of greatest significance, there were more than 200 Soviet journalists in Western Europe. The CIA estimated that at least one-third of the nearly 2,500 Soviet and Soviet bloc diplomats and representatives (trade and commercial) were either KGB or GRU (Soviet military) agents.

An unknown percentage were engaged in political espionage, enlisting and utilizing agents of influence. Through the testimony of Soviet and bloc defectors, who were previously involved in active measures, we know that journalistic cover was a KGB priority. It gave the agent an opportunity to legitimately meet a wide range of potential contacts.

Such a person may have been an unwitting agent, a dupe of KGB subtle persuasion and psychological manipulation. Not infrequently, that person was also a journalist. Caught on the hook of his own ego by a KGB operative, who appeared to be anything but, the unwitting agent was slowly and gently played through flattery and praise. He was given a chance to contribute an article to a select group of Soviet intellectuals, after which more articles were accepted and he received payment. Inside information was exchanged for inside

information until the unwitting agent began writing or broadcasting information that favored a particular Soviet line. The line could be political, military, scientific-anything that contributed to influence. In some cases the end result was blackmail, in others it was not. In all cases, however, the KGB's aim was served. There were no figures on agents of influence-only the knowledge that they were in our midst.

The term communications warfare sums up the totality of Soviet active measures-the use of words as weapons in all forms of media. Participants in this strategy were Soviet international fronts: propaganda organizations that conducted their activities under the semicovert direction and control of the ID. Lenin referred to the concept of fronts-groups that denied their Soviet connection while pushing the Soviet line-as transmission belts. Soviet fronts were in the vanguard of preaching, publishing, and fostering Moscow's aims.

Soviet International Fronts

The Soviets had 13 major international fronts and numerous smaller offshoots and satellites. Together they formed an interlocking network that specialized in advancing the Soviet propaganda line within noncommunist countries and the UN, and in emphasizing peace and disarmament as viewed from the Kremlin.

Months before General Secretary Gorbachev accepted President Reagan's invitation to meet in Geneva in November 1985, the fronts had received their marching orders from the ID. Meeting in Helsinki in April of that year, the leader of the 13 fronts drafted plans to launch an all-out campaign against the strategic defense initiative (SDI). The Helsinki gathering was hosted by Romesh Chandra, President of the World Peace Council (WPC, the largest and best known of the Soviet fronts). Chandra was also a member of the Politburo of the Indian Communist Party. Several weeks prior to the conference, the WPC had launched a global appeal against Washington's "space madness," proclaiming "No!" to Star Wars.

After that, the Soviet campaign to attack SDI and generate fear about it was unceasing. Through their publications, demonstrations, and forums, the fronts churned out a stream

of disinformation on SDI-never pointing out, of course, that SDI is a nonnuclear system whose purpose is to destroy missiles, not people.

A broad-gauged view of the campaign occurred in Prague in July 1985 when the Christian Peace Conference (CPC) held its sixth All-Christian Peace Assembly. The CPC had been a Soviet international front since its formation in Prague in 1958; its purpose was to encourage noncommunist clergymen and their congregations to support Soviet policy, including the invasion of Afghanistan. Nearly 800 participants from 97 countries attended the assembly. At the weeklong sessions, staged to address the social and economic ills of the world, a single message overrode all else: SDI meant the militarization of space. SDI was the promotion of an aggressive policy, a web of deception. SDI was a frightening expression of human hubris.

The Soviet propaganda efforts did not succeed in changing President Reagan's strategic policy at the Geneva Summit or, nearly a year later, at Reykjavik. This lack of success, however, did not halt the ongoing Soviet effort against SDI.

Soviet international fronts never admitted defeat on any issue, and they claimed victory in President Carter's 1977 decision to forego stockpiling the neutron bomb in NATO arsenals. In following ID instructions, their emphasis could shift from the neutron bomb to INF, to chemical-biological warfare (CBW), to SDI. All Soviet policy issues played continuing roles in the fronts' propaganda.

To conceal the obviousness of their real purpose, some fronts (such as the WPC), formed additional fronts and satellites. The Vienna-based International Institute for Peace (IIP) is one example; its hierarchy was made up of high-ranking officers of the WPC. The IIP sought to attract noncommunist academics and professionals who were willing to accept the false notion that the institute was a place where scientists from East and West could frankly exchange research results on all aspects of the peace issue.

Another WPC offspring was the International Liaison Forum of Peace Forces (ILF), which was formed at WPC headquarters in Helsinki in 1973. Like the IIP, the ILF was heavily staffed by WPC officers. The ILF held a series of dialogues on peace

issues; for example, opposing SDI and NATO's INF deployment. Mostly, these conferences were held in Vienna, their WPC connection carefully obscured. The ILF was turned on and off as the Soviet International Department required.

Another Soviet front that was created through WPC organizational efforts was Generals for Peace and Disarmament (GPD). Its membership comprised 13 retired senior NATO officers. Foremost among them was Italian Gen Nino Pasti, who had once served as NATO deputy commander. He and four of his fellow members were closely associated with the WPC. Unlike other Soviet fronts, the GPD held no conferences on its own. Some of its members either attended, or sent frequent statements of support to, the major front peace congresses. The members also wrote books and pamphlets that attacked NATO policies and that tacitly-sometimes vigorously-supported the Soviet line. Based in London and chaired by retired Brig Michael Harbottle, the GPD was found by the British Foreign Office to have collective views that were contrary to those of the British government and its allies. Brigadier Harbottle and some others did a considerable amount of traveling, seeking media interviews and public forums from which to speak against allied military strategy. Harbottle took credit for arranging four meetings with retired Warsaw Pact generals in which there was unanimous agreement that the United States was a threat to world peace.

The propaganda drive of the Soviet fronts for 1986 was a coordinated campaign to dominate the UN-proclaimed International Year of Peace (IYP). As nongovernmental organizations (NGO) were granted consultative status with UN economic and social departments and agencies, the fronts positioned themselves to lead the IYP celebration. (The IYP chairman, Viacheslav A. Ustinov, was under secretary general for UN political and security council affairs.)

In all, there were more than 800 NGOs, only seven of which were Soviet-directed fronts. Yet, when the 250-member Conference on Non-Governmental Organizations (CONGO) elected a 20-member board to direct operations, five of the board members were representatives of the seven Soviet fronts. In January 1986, the CONGO met again in Geneva to hold conferences under the slogan "Together for Peace." Of the

18-member executive committee chosen to organize and direct the congress, six of the delegates were representatives of Soviet international fronts-and the WPC was separately selected to coordinate CONGO activities with the UN governing body.

Throughout 1986, these particular fronts, calling themselves closely cooperating NGOs, preached the Soviet propaganda line on disarmament and peace. They collectively moved toward a climactic assembly held in October 1986 in Copenhagen under the rubric of a World Peace Congress. An attempt was made to indicate that the congress organizers had been drawn from a broad political spectrum. Such was not the case, however: The WPC-at roughly three-year intervals-was the planner, organizer, and director. The last world peace congress was held in Prague in 1983. The WPC sought to conceal its role in the Copenhagen Congress, but Denmark's Social Democratic Party (SDP) exposed it and declared that this widely heralded peace gathering was nothing more than a Soviet front operation. The Danish press reported accordingly. This exposure did not stop the event, but the SDP spokesman issued this statement: "The members of the Congress Preparatory Committee do not represent a broad selection of political affiliations. We have checked the names of the people on the organizing committee and the vast majority are Communist."

Nevertheless, some 2,000 delegates and peace activists from around the world assembled to attack US policies, support the Soviet Union, and damn SDI. It seemed appropriate that the five-day peace congress ended in a wild melee when protesters against Soviet human rights violations attempted to make their point. After that, the Soviet international fronts were less vocal and more restrained, and Soviet propaganda was promulgated more directly by Soviet entities; for example, the Soviet Friendship Society.

The Gorbachev Era

When President Reagan met with General Secretary Gorbachev in Geneva in 1985, their views of disarmament revealed major differences. There was one area, however, in which all

participants at the summit appeared to be in agreement: the need to have a greater degree of cultural and personal exchange and a lesser degree of suspicion, animosity, and cold-war propaganda.

Perhaps it was a new beginning. The media proclaimed it the spirit of Geneva; Gorbachev called it glasnost (openness). It does not appear, however, that this spirit trickled down to the purveyors of Soviet active measures. Consider, for example, the following:

- The Tass disinformation report on US scientists developing ethnic weapons to be used against South African blacks was repeated as 'recently as June 1987.
- Post-Geneva Soviet and surrogate propaganda implied that the CIA was behind the assassination of Swedish Prime Minister Olof Palme.
- Post-Geneva Tass claimed that the US Air Force had bombed Honduran peasants with poisonous substances at night. (The charge was completely refuted by Honduran health officials.)
- Lies emanating from Moscow and carried by Soviet surrogates (e.g., the New Delhi *Patriot*) maintained that the CIA was involved in the assassination of Prime Minister Indira Gandhi, the Air India crash, and rebellion among the Sikhs.
- The Soviet press alleged that the United States continued to create biological warfare weapons when, in fact, the United States was in full compliance with the 1972 treaty that banned the production of biological and toxic weapons.
- Soviet sources alleged that the CIA perpetrated the 1978 Jonestown massacre in Guyana (a US congressman and 918 cult members were killed). The story appeared first in *Izvestiya* on 30 January 1987 and again in the Leningrad Komsomol (communist youth organization) newspaper on 10 April 1987. A particularly gruesome account, containing photographs from Jonestown, appeared in the 2-8 March issue of *Nedelya*, a Sunday supplement of *Izvestiya*. Soviet media accounts were based on the book, *The Murder of Jonestown A CIA Crime*, published by a Soviet Ministry of Justice publishing house.

The Soviet AIDS Campaign

A recent campaign on acquired immunodeficiency syndrome (AIDS) provides insight into the methods used by the Soviets to spread a totally false story; that is, that the AIDS virus was scientifically engineered in a US laboratory at Fort Detrick, Maryland, and released into the mainstream by criminals and homosexuals who had volunteered to be guinea pigs. In October 1985, *Literaturnaya Gazeta*, attempted to launch such a campaign through the New Delhi *Patriot*, but there was only sporadic pickup by the foreign press. In May 1986, the *Litgaz* newspaper of the Soviet writer's union tried again; again, there was little outside response.

During these scattered Soviet attempts to sell the idea that AIDS was a made-in-the-USA product, US Ambassador Arthur Hartman wrote letters of protest to the editors of the publications involved, but the letters were not published. The ambassador later made the letters public, pointing out that the accusations were false and that the scientific claims were ridiculous.

The Harare Nonaligned Summit (NAM) became the launch pad for another Soviet-directed AIDS disinformation campaign that was to have far more success than the previous attempts to sell the lie. For several months prior to the NAM, Soviet and pro-Soviet media had claimed that the US government (CIA) was out to wreck the NAM, but no mention was made of the US being responsible for AIDS.

The opening attack came just prior to the summit with articles in the *Harare Sunday Mail* and the *United News of India*, reporting the distribution of a scientific tract to the delegates titled *AIDS U.S. Homemade Evil, Not Made in Africa*. (Its actual title was *AIDS-Its Nature and Its Origin*, but it sought to sell the aforementioned thesis.) The false claims of the document failed to take hold at the conference, due in part to a swift retraction by the *Harare Sunday Mail*, which carried an interview with an American virologist on the faculty of the University of Zimbabwe. The virologist found the document to be totally without scientific merit.

There was no further mention of AIDS until Novosti, the Soviet news agency, reported from Moscow that two French

scientists had confirmed that AIDS was the result of bacterial warfare testing in the United States. That same day in Damascus, *Al Thawra* ran the Novosti account on its front page. Two days later, "Radio Prague" broadcast the same story in its English language Afro-Asian service program. Tass then repeated the disinformation that AIDS had been developed at Pentagon laboratories at Fort Detrick, Maryland. This story was also reported in Kampala in the leftist magazine *Weekly Topic*.

Later, the London *Sunday Express*, certainly no part of the Soviet active measures apparatus, ran an interview story with Professor Jacob Segal and his wife, Lilli, principal authors of the Harare Summit AIDS document. The *Express* reported that Segal, and to a lesser degree his specialist colleagues (Dr John Seale of London and Dr Robert Strecker of Glendale), contended that the killer AIDS virus was artificially created by American scientists during laboratory experiments which went disastrously wrong and that a massive cover-up has kept the secret from the world until today. This totally erroneous front-page claim had the effect the Soviets sought. Coming from London in a conservative publication, the disinformation caught hold.

In the week that followed, 14 USIS posts reported reprintings of the *Express* story. By end of the month, the total approached 30. Publications in Africa, Latin America, the Middle East, India, and Western Europe carried the disinformation. In Wellington, New Zealand, The *Dominion* ran the story on its front page under the heading, *Bizarre Theory on AIDS Origin*. In Helsinki, although a tabloid carried the piece, it also carried this quote from a noted Finnish AIDS expert, Dr Jukka Suni: "I know of Doctor Segal and of his reputation. He is a 'prophet of doom' who has been getting worse year after year."

In Eastern Europe, only in Poland was the *Express* article replayed. It was featured in the Polish government daily, which made a connection with the *Literaturnaya Gazeta* account of October 1985. Several days later, the Soviet press weighed in through Tass and *Pravda*. The Soviet official news agency used reports from its New York correspondent, who had cited out of context a National Academy of Science report on AIDS. Tass attempted to link factual scientific information with Segal's

Fort Detrick disinformation. Segal was again referred to inaccurately as a French scientist.

Pravda went a vicious step further, running an editorial cartoon that showed a man in medical dress handing a beaker full of swastikas suspended in liquid to a second man wearing a US military officer's uniform. The officer is handing the doctor a wad of dollars. The beaker is labeled "AIDS virus." A number of corpses lie on the floor. Ambassador Hartman again wrote letters of protest, this time to the editors of Tass and *Pravda*. As before, he received no response.

Result of USIA/State Response

Although the disinformation campaign was initially successful, rebuttals from USIA and State Department INR quickly helped to reverse original media acceptance of the Soviet effort. Adding to this was the stabilizing effect of two widely attended AIDS conferences in Brazzaville and Berlin. In Brazzaville, where representatives of 37 countries gathered under the chairmanship of Dr Johnathan Mann, AIDS director of the World Health Organization, no mention was made of the campaign. In Berlin, it was dismissed as being unworthy of comment.

As a result, many of the publications that had carried the *Sunday Express* story printed retractions (which included a modified backdown by the *Express* itself). In a stinging editorial, the *Hindustan Times* declared that not a single reputable scientific journal had supported the thesis that AIDS was man-made. Almost every Western specialist is convinced that the AIDS virus mutated naturally and spontaneously from an animal virus.

In Brazil, *O Estado de S. Paulo* observed that AIDS and *disinformatza* are very similar in their corrosive action: One infects and destroys the body while the other succeeds in shaking and disorienting the soul. There are two basic questions at the root of this Soviet active measures campaign: Where did the claim originate? Who are the scientists who have attempted to spread them?

In July 1983, the New Delhi *Patriot* published a letter from an unnamed "well-known American scientist and anthropologist

who wished to remain anonymous." The letter was a lengthy undocumented account of how the AIDS virus was developed by the CIA and the Pentagon. Fort Detrick, Maryland, was reported by the writer to be the place where the disease was created. He added just as incorrectly that a similar US laboratory in Lahore had bred super mosquitoes and other insects that could spread dangerous diseases such as yellow fever, dengue, and encephalitis. The only source the unknown writer gave for any of this information was the totally unreliable cult organization, the Church of Scientology.

Literaturnaya Gazeta used this rambling piece of gobbledygook as its source in its October 1985 story. So did the Segals in their document presented at Harare. Jacob Segal was born in Leningrad and was a longtime resident of the Soviet Union before moving to East Berlin. He is a 75-year-old retired biologist and self-announced AIDS specialist who failed to attend the mid-November Berlin conference on AIDS. He maintained that AIDS was first tied to Fort Detrick by a British researcher who published an article in a New Zealand journal. Segal's wife, Lilli, however, offered a different source-the East German Urania Press. Urania's prime function was to disseminate Soviet propaganda.

Lilli Segal is a retired researcher and professor of epidemiology. She survived Auschwitz and has been a resident of the GDR since 1953. She and her husband worked as biology instructors in Cuba for several years. Both have been retired from Humboldt University since 1983. Their AIDS thesis was absurd, according to world renowned AIDS specialists. It had no bearing on serious scientific knowledge of the virus. It was on a par with the Segals' attempt to link the surfacing of the disease in New York City with its proximity to Fort Detrick. Their report stated that criminals who had engaged in homosexual practices during the long time of their imprisonment "obviously" concentrated in the nearest big city after their release and it was therefore logical that the first AIDS cases should have been registered in New York. In fact, however, New York is 250 miles from Fort Detrick while Baltimore is only 45 miles and Washington, D.C., 50 miles from that installation. Further, President Richard M. Nixon called a halt to all offensive biological warfare experimentation

in 1969. In its place, a vaccine program was instituted at the US Army Medical Research Institute of Infectious Diseases. The laboratory's work was focused on finding vaccines against biological warfare.

Fort Detrick is not used entirely for military purposes. Of the 25 tenants on the installation, one is the Frederick Cancer Research Facility. It operates under the direction of Health and Human Services with a department devoted to AIDS research. It has never been a military component. Other research is conducted by the Department of Agriculture in both foreign and domestic crop diseases. Fort Detrick's *raison d'être* is to cure, not to inflict; to prevent, not to infect.

It should be added that neither Dr John Seale, London venereologist, nor Dr Robert Strecker, California gastroenterologist, both of whom were quoted in the Sunday Express, subscribed to the disinformation regarding Fort Detrick.

Conclusion

The twisted course of the Soviet active measures AIDS campaign can be traced back to a Soviet-aligned Indian newspaper. It quoted an unnamed individual whose line of lies took root in the Soviet press and briefly flourished via a Soviet-bloc document that was completely lacking in scientific credibility. Later, a new piece of AIDS disinformation emerged from India. It attempted to link the disease to a Union Carbide pesticide. Still later, a Communist party member in the Indian parliament sought to press the AIDS-made-in-the-US line. Nevertheless, the disinformation boomeranged on the Soviets; many publications around the globe have come to recognize and understand the nature of this Soviet active measure.

Appendix A

THIS PAGE INTENTIONALLY LEFT BLANK

Weinberger Forgery

A few years ago, a forged document purporting to be a speech by US Secretary of Defense Caspar W. Weinberger surfaced in the Federal Republic of Germany. The document is dated 25 November 1983. No such speech was ever made, and Secretary Weinberger never made the remarks attributed to him. The document was a complete fabrication. Its aim was to convince Europeans that the US purpose in developing the Strategic Defense Initiative (SDI) was not only to gain US military superiority over the USSR but also to dominate its NATO allies. Both goals were supposedly to be accomplished largely by US control of space through SDI, which was described in the forgery as an offensive system.

The concepts used in the document did not reflect US government thinking, but were, in fact, what the Soviets wanted West Europeans to believe about US views. Although for the most part the forgery was written in acceptable English, several mistakes in word usage indicated that the drafter's first language was not English. For example, it asserted that the United States sought "prevalence" over the Soviet Union at all (military) levels. The forger(s) confused *prevalence* with *superiority*.

A major point made in the forgery was that the United States would suffer a disastrous depression without SDI. However, the key and distinctive error had the secretary of defense commenting that the Soviets have not been engaged in an SDI program of their own. In fact, Secretary Weinberger, the president, and other leading US defense spokesmen had pointed out repeatedly that Soviet scientists had been at work on a similar project since 1968.

The Weinberger forgery is one of several addressed in this report. All sought to undermine US policies and intentions.

Disinformation Hits Home

Soviet disinformation attempted to "hit home" with a forged letter purportedly written by Herbert Romerstein, United States Information Agency (USIA) Soviet active measures coordinator to US news organizations. The Washington Post

approached USIA with the forged letter, which Mr Romerstein had supposedly sent to Senator-Select David Durenberger (R.-Minn.), chairman of the Senate Select Committee on Intelligence. The forgery was cleverly conceived but poorly executed. Its purpose was to smear USIA by making it appear that the agency was proposing that the United States should make false claims about the Chernobyl nuclear accident.

The forgery alleged that Mr Romerstein proposed to Senator Durenberger that USIA disseminate rumors about the accident. The forgery suggested that "our associates in European information media" spread reports that would include the following details:

- the "number of victims should be alleged to be somewhere between 2,000 and 3,000";
- a "mass evacuation of population from the 100-mile zone" around Chernobyl should be alleged to have occurred; and
- "transport problems, shortage of various goods, chaos, and panic should also be given publicity."

The forgery also recommends that "our allies should be influenced so as to make a request for compensation for contamination of their territory." The document takes advantage of the insights offered by hindsight. It is backdated to 29 April 1986, the day after the Chernobyl accident was first reported by the Soviets and just before rumors (of exactly this nature) began to appear.

Had the forgery been accepted by the press, it would have given currency to the notion that rumors about Chernobyl had been generated by USIA rather than by the Soviets' refusal to release sufficient data about the events surrounding Chernobyl. At the same time, USIA would have been cast as a manipulative, rumor-mongering propaganda apparatus free to dictate to senators and unnamed "associates" in the European media.

Poor execution, however, ruined the Soviet attempt. The forgery was not composed correctly and it contained an incorrect address for Durenberger. Its falsity was easily ascertained by journalists who telephoned the USIA and Senator Durenberger's office.

Ironically, Romerstein's forged signature was taken from a letter he had previously sent to Lt Gen Robert L. Schweitzer,

head of the Inter-American Defense Board, informing General Schweitzer about a forgery purportedly written by him. Even more obvious, the word copy in Romerstein's handwriting at the top of the Chernobyl forgery is identical to a notation made on copies of the letter to General Schweitzer.

The forgery had all the hallmarks of a Soviet active measure, although its sloppiness probably indicated an operation executed by personnel in the United States rather than those in the Moscow Center, who could be expected to produce a more professional product. In analyzing forgeries, one key is to determine who benefits. Certainly, Soviet purposes would have been served if the USIA had been blamed for the bad press that was actually caused by Soviet intransigence and stonewalling over Chernobyl.

Levchenko on Dobrynin

At a USIA briefing on 20 August 1986, at Washington's Foreign Press Center, former KGB major and active measures specialist Stanislav Levchenko made some observations about Anatolii Fedorovich Dobrynin, former Soviet Ambassador to the US who later headed the Soviet Communist Party Central Committee's International Department.

Mr Dobrynin's appointment to the International Department post had been the subject of much speculation in the American press. As a former staff member of the International Department, Levchenko's perspective on this issue was instructive.

Basically, Levchenko discounted the theory that Dobrynin's appointment was "positive for the future development of healthy relations between the Soviet Union and the United States."

I dare to disagree with this point because if Mr Gorbachev really wanted him to do that kind of job, he could have made him, let's say, first deputy foreign minister in charge of bilateral relations with the United States, and he could spend all his days and nights working in that field. Instead, Anatolii Dobrynin becomes chief of the International Department, which, in another parlance, is the largest subversive mechanism in the world. The purpose of that department is not enhancement or deepening of bilateral or multilateral relations at all. It's just the contrary. It is the department which, among many other

functions, is disseminating disinformation in the interests of the politburo and running all sorts of operations in that field.

Levchenko believed that Dobrynin would reinvigorate the active measures operations of the International Department and use his knowledge of the United States to bring a new professionalism to its activities.

He, of course, knows about some flaws which the active measures machine had during the last couple of years when his predecessor, Boris Ponomarev, was really getting old. I personally have no doubt that Mr Dobrynin will try, within a rather short period of time, probably within this year, to restructure the mechanism in such a way that it will work better, on a much more professional basis, that sloppiness will probably disappear, and that the scale of operations against primarily the United States and NATO countries on a global basis will definitely be enhanced. That's my projection.

Levchenko's final assessment on Dobrynin: "He is the person who has close to perfect knowledge of the United States. He's probably one of the best specialists in the Soviet Union on the United States, who is generally considered to be a very talented, bright person who is, of course, a devoted Communist and quite a devoted person to the cause of the politburo."

National Security Council Forgery

A very well-done and ambitious forgery surfaced in Lagos, Nigeria. It bears the title, "US Strategy in Foreign Policy 1985-1988" and falsely claims to be a "copy of a summary paper on US foreign policy approved by the (United States) National Security Council (NSC) in February 1985." A section of the forgery dealing with purported US policy in Africa was published in Lagos in the weekly magazine Africa Guardian. Its broad scope and relative professionalism increase the chances that it may reappear in other areas.

The forgery was a 10-page, single-spaced document lacking any identifying symbols and classification markings. It was divided into eight topical sections dealing with US policy toward important regions. It was cleverly crafted, skillfully weaving together US policy with phony assertions that would outrage foreign as well as domestic audiences. For example, the United States was falsely portrayed as believing that "a

preemptive strike potential, together with guidance, communications and intelligence systems of high sophistication, would guarantee our security to a degree which would permit us to exert severe pressure on the Soviet Union to the point of issuing an ultimatum if necessary."

Other false assertions were that:

- The United States was seeking "the establishment of an effective first-strike (nuclear) capability by the year 1995."
- "Strategic superiority" was the goal of US policy, and advances in military technology might "suggest" or "even demand a preemptive strike."
- NATO allies should be pressured "to conform to US policies."
- The US problem with the Greek leadership was that it had an "independent attitude."
- The United States is opposed to curbs on nuclear and chemical weapons.
- In Nicaragua, "US military intervention cannot be ruled out, keeping in mind the lesson of Grenada."
- The Organization of American States "should be made to accord with our national interests."
- A negotiated settlement between Vietnam and an ASEAN bloc over Cambodia "in no way corresponds with US interests."
- Japan must agree to a stronger US military presence in that country and to increase its military strength through the purchase of US arms.
- The United States will "seek to hold China to policies corresponding with US global interests."
- The United States feels that China has an "unpredictable political future" and an "absence of stable power succession procedures."
- The United States opposes the successful implementation of China's modernization program because it "might lead to rivalry or even confrontation with the United States."
- "Nothing short of Qadhafi's assassination will bring any significant change in Libyan policies of support for international terrorism."
- Israel is referred to as "the Jerusalem government," implying recognition of Jerusalem as the capital.

- The United States is planning to use the rapid deployment force for "preemptive operations" if a "threat to our interests" arises.
- The Soviet presence in Afghanistan is seen as a "propaganda bonus" which can be utilized to increase US military and political power in the Persian Gulf region, perhaps even leading to "the restoration of American influence in Iran."
- The main lines of US policy in Africa are to exploit the area as a necessary source of raw materials and to control African affairs in conjunction with South Africa.

Many other themes and subthemes were planted in this lengthy forgery. As with the other forgeries mentioned above, this one appears to be a product of the Soviet Union or one of its surrogates. The themes cited reflect Soviet claims about US policy.

The Assassinations of Olof Palme and Indira Gandhi

If one were asked to name the major similarity between the gunning down of Swedish Prime Minister Olof Palme and the gunning down of Indian Prime Minister Indira Gandhi, the answer would be that the Soviet Union, by innuendo, falsely accused the Central Intelligence Agency (CIA) of committing both crimes and repeated the lie through its propaganda outlets.

On 31 October 1984, Prime Minister Indira Gandhi of India was assassinated by Sikh members of her bodyguard. Several hours after the murder, "Radio Moscow" declared the assassins had "received their ideological inspirations" from the CIA. "Radio Moscow" broadcast a familiar litany of disinformation, accusing the CIA of guilt in the assassination of world leaders over a 25-year period.

Pro-Soviet Indian publications were quick to pick up the Moscow line. They added their own embellishments, some directly accusing the United States of having murdered Mrs Ghandi. These claims were replayed by the Soviet press. Responsible Indian newspapers would have none of it, however. A *Hindustan Times* editorial summed up public

reaction: "The Soviet media saw in the grim event a golden opportunity to mount cold war propaganda against the United States.... Cold War propaganda on such a tragic occasion by the Soviet Union is uncalled for and most unfortunate." President Reagan called the Soviet allegation, "the world's biggest cheap shot in a long, long time."

The Soviet lie became a double lie when Secretary of State Shultz confronted Soviet Prime Minister Tikhonov at Mrs Ghandi's funeral and Tikhonov denied that his country was making such claims. The Indian government, in a determined investigation of the assassination, found no trace of any US involvement.

These events occurred about a year before President Reagan met with General Secretary Gorbachev in Geneva and some 15 months before the murder of Swedish Prime Minister Palme. It was hoped that the Geneva meeting would bring a change in the kind of outrageous disinformation that had been spewing out of Moscow day in and day out.

Prime Minister Palme was killed on a Friday night. The next day, Tass published a commentary on Palme's death. The commentary was written by Anatoly Krasikov, deputy director of Tass. Krasikov's commentary, according to the Swedish daily *Aftenpost*, "indicated that CIA is behind the murder." This commentary employed exactly the same kind of slippery innuendo "Radio Moscow" had used in implying that the CIA was responsible for Indira Ghandi's assassination.

The next day (Sunday, 2 March), *Pravda*, the official Communist Party newspaper, added its commentary. The writer, Chingiz Aytmatov, academician of the Soviet Academy of Sciences and delegate to the 27th Congress of the CPSU, raised a basic question and then answered it. Who was, or who were, the assassin(s)? We do not yet know, but it is clear even now that the terrorist crime was committed by forces that are interested in shifting whole countries and regions to the right and in intimidating the public, which heeds the voice of an honest individual.

Response from the Swedish newspaper *Morgenbladet* was swift. In an editorial titled "Grotesque," it attacked Gorbachev's 'mouthpiece' in choosing to exploit the situation at a "tragic moment." It went on to say, "the real question is what Gorbachev

means with his fine words about detente and peace when he allows such gross propaganda. There is brutal contradiction between the hopes he has expressed for a relaxation of internal tension and his continued hammering on public opinion with anti-American propaganda."

On Monday, the New Delhi Hindi daily *Navbharat* carried a Moscow dateline report: "The official agency Tass has alleged that the assassination of Swedish Prime Minister Olof Palme was the handiwork of the CIA." Other Indian publications, particularly those that were pro-Soviet, repeated the accusation and parallels were drawn between the political viewpoints of Mrs Ghandi and Mr Palme.

In the course of the next few days, the Tass-Prauda effort was replayed in a number of locales-Ghana, Malta, Australia, Uruguay, Peru. In the latter two countries, the publications were Communist Party weeklies. In Australia, the conservative daily *Australian* concluded an account by its Moscow correspondent with a quote from former Swedish Prime Minister Falldin: "I refuse to believe it is a political assassination.... This must be the work of a lunatic."

Elsewhere around the globe, the Soviet accusation was ignored; but that was not the end of it. Seventeen days after the murder, Aytmatov, the writer of the Prauda commentary, was interviewed by the Swedish newspaper *Dagens Nyheter*. "Aytmatov was now clearly alarmed that his words would be interpreted" to suggest the CIA had committed the crime. But the Prauda writer's retraction was something less than unequivocal: "The people who murdered Olof Palme do not need to come from the United States or the CIA-even though it does seem to be the case of reactionary forces."

The Soviet academician was simply following the standard Leninist technique of hedging his Prauda commentary with obfuscation. However, just as the Soviet-oriented accusations of CIA guilt in the assassination of Indira Ghandi continued to surface, so, too, did those about Olof Palme. His name was added to the long list of assassinated leaders that Soviet disinformation organs recited on a regular basis as victims of CIA operations.

Yellow Rain Again

Certain characteristics in Soviet active measures operations followed a consistent pattern. One was to try and reverse blame for Soviet Military actions by accusing the United States and its allies of carrying out exactly the same acts. This was done not only by describing the Soviet techniques originally followed, but also by employing the same terminology; for example, *yellow rain*.

In March and November 1982, the US State Department presented to the United Nations reports of "Soviet involvement in provision and use of toxin weapons." The reports offered "information, evidence and an analysis of results the United States had obtained on the use of toxin and other chemical war agents by the Soviets in Afghanistan, and by the Lao and Vietnamese under Soviet supervision in Laos and Kampuchea." The victims referred to chemical agents that had been sprayed and dropped on their villages by plane, helicopter, and artillery shell as yellow rain. Between August 1983 and February 1984, further evidence of yellow rain attacks in Southeast Asia were submitted by the United States to the UN. These charges were angrily denied by the Soviets, who submitted their own scientific paper. It maintained that Agent Orange, the defoliant used by the US to clear jungle areas during the Vietnam War, had contaminated the elephant grass. Its infected spores, the Soviet government claimed, had been carried by prevailing winds into Laos and Kampuchea where they had tainted the environment and brought illness and death to those affected. Scientifically, this explanation was recognized as hogwash.

By the end of 1985, reports of yellow rain in the aforementioned areas had "diminished in number." But on 7 February 1986, yellow rain was suddenly in the news again. This time, the area was Honduras and the culprit was the US Army. The newspaper *Tiempo*, reporting from San Pedro Sula, quoted a leftist trade union publication which maintained that the US Army was spraying lethal chemicals on civilians in northern municipalities for experimental purposes. The chemicals, it reported, caused fainting and convulsions. Further, it said that strange sores appeared on the bodies of

children. The report said that the affected communities had requested investigations by health authorities.

In the first published accounts of the reported problem, no mention was made of yellow rain. On 22 February, Tass quoted *Red Star*, the official Soviet Ministry of Defense newspaper: "The United States is carrying out criminal experiments with chemical weapons in Honduras. . . . U.S. aircraft have been scattering yellow toxin in the air similar in its characteristics to the highly toxin 'Agent Orange.' . . . Eyewitnesses to the secret flights by the US aircraft say that 'yellow rain' falls every time the aircraft appear."

That same day, "Radio Moscow" offered a commentary, repeating the same accusations and using the same terms. But the accusation went even further. The commentator said the Pentagon was preparing to launch chemical and biological warfare against Nicaragua and was responsible for an epidemic of dengue that had hit that country earlier. Some of these charges were picked up by the Panamanian press, which added that the yellow rain story had been born of a theory "between groups of the Honduran Left."

Previously, the US Embassy in Tegucigalpa had denied that US forces were testing chemical weapons anywhere in Honduras, "least of all against the civilian population." Not only had a US medical team investigated the charges, but so had the US military and a Honduran congressional group. Under the heading "Congressmen find downpour of calamities instead of yellow rain," the newspaper *La Prensa*, along with other Honduran publications, including *Tiempo* (which had broken the original story), cited the cause of the problem as an epidemic of mange stimulated by a lack of hygiene; the germ had spread through physical contact.

The daily *El Haraldo* carried an interview with Honduran Army Chief of Staff General Humberto Regalado Hernandez, who said that a military investigation coincided with state and private reports. The disease, he said, had been known since biblical times as scabies and was not the result of chemical gases dropped from unidentified aircraft on evening flights. The only flying in the area had been done by Honduran crop dusters who were spraying sugar cane.

The general added that he believed the purpose of the stories was to discredit US military detachments that were training in Honduras. Another possibility, he said, "is that the USSR, via Cuba and Nicaragua, is using sophisticated methods.... The presence of 'yellow rain' in our homeland was ruled out, but there is evidence that the local fifth column is carrying out disinformation campaigns ordered by the Soviet connection in Tegucigalpa." This Soviet yellow rain story was turned off by the combined actions of the Honduran government and the press.

What Soviet PSFOP Mirror Imaging Can Tell Us

James Melnich

Soviet psyoperators were sometimes ignorant of significant nuances concerning the societies they targeted for propaganda development. Though time and experience tended to improve certain technical aspects of Soviet PSYOP, Soviet psyoperators sometimes continued to reach down into their own limited Soviet experiences for examples and themes that they projected onto the Western societies they were attacking in their propaganda. Study of this mirror-imaging process can be very revealing and may point out important weaknesses. This is true even though some segments of the Soviet PSYOP hierarchy appeared to have gained in sophistication. Identifying some of these tell-tale characteristics will help us to assess the overall Soviet PSYOP threat.

Glasnost, Gorbachev, and Disinformation

The campaign of glasnost in the Soviet Union under Mikhail S. Gorbachev, with its emphasis on a more open Soviet press, by no means signaled an end to Soviet disinformation. On the contrary, since the press in the USSR began writing on many topics previously considered taboo, there were more opportunities for mirror-imaging disinformation to present itself—perhaps with some new twists.

For example, we can examine one of Gorbachev's perceptual blunders concerning the United States and see how it relates to the concept of mirror imaging. In early 1987, Gorbachev met with several US congressmen in Moscow. In the course of their discussions, he suggested that America create separate states for blacks, Puerto Ricans, and citizens of Polish background.¹ Apart from this being a ludicrous and insulting

recommendation, it provides some insights into the Soviet system. To begin with, it demonstrates Gorbachev's ignorance of the internal policies of the United States. Further, it assumes that we have a Polish problem that must be dealt with. From the standpoint of mirror imaging, it suggests that the Soviets dealt with many of their minority problems by sending minorities to autonomous regions somewhere in the Soviet Union.

The Soviets had serious minority problems, especially with their Central Asian Muslims. There have been riots in Kazakhstan, demonstrations in the Baltic states, demands by Crimean Tatars for their rights, and pressures for greater Jewish emigration. Demographic analysis of the Soviet population suggests that the Great Russian nationality itself was becoming a minority in its own country as Central Asian birthrates skyrocketed.

As Soviet policymakers sought answers to these problems, Soviet propagandists were producing disinformation about an alleged Western ethnic bomb supposedly targeted against US minorities. This propaganda is an excellent example of mirror imaging. What some in the Soviet Union undoubtedly wished they themselves had, they projected as a policy practiced by their ideological enemy. This disinformation example shows us both the Soviet propagandists' intense prejudice and how limited their worldview really was. It is an example that is repeated over and over in a variety of contexts, whether one is considering AIDS, baby parts, or chemical weapons.

One might add that, although the Soviet Union did have its share of extremely sophisticated propagandists, such as Georgii Arbatov of the Institute of the USA and Canada, Politburo member Aleksandr Yakovlev, and Vladimir Posner of Radio Moscow, the fact that Gorbachev himself could make such an error should tell us something about the attitudes of rank-and-file Soviet propagandists.

Ultimate Enemy Projections

Soviet propaganda was rife with allusions to the ultimate enemy, whether that enemy be world imperialism, Nazi storm troopers, supporters of SDI, Zionism, or religious activists in

the Soviet Union. The ultimate enemy was usually portrayed as being antihuman and opposed to everything the Soviet Union stood for. For example, Zionism was defined as a "deadly enemy of the Soviet State from its very beginning."² There was usually a plurality of Soviet ultimate enemies, depending on the international situation. An ultimate enemy in Soviet propaganda was first dehumanized, then made part of an anti-Soviet worldwide conspiratorial network (i.e., Afghan freedom fighters became bandits fighting as agents of US imperialism; unofficial religious groups in the Soviet Union were linked with dark forces from abroad).

In attempting to describe the ultimate enemy, whoever and whatever that might have been at a given time, Soviet propagandists sometimes drew from actual Soviet acts of barbarism. Thus their disinformation, as a form of mirror imaging, reflected back into the pool of Soviet reality. For one example, I will draw from personal experience.

In the early 1980s, I met a Soviet emigre woman who was convinced that evangelical Christians in the Ukraine sacrificed babies by rolling them in barrels with spikes as part of some religious ritual. She, of course, had never witnessed such a thing, but said that she had heard about those people when she lived in the Soviet Union. Obviously, she was the victim of very gross Soviet disinformation-and there were other Soviet campaigns in which other religious groups were under attack by the state. One can find numerous articles accusing Soviet Baptists of drowning children or performing other dark and perfidious acts-the whole purpose being to defame the targeted group and further isolate them from the general population.

Nevertheless, the matter of the spikes continued to bother me: why such a particular disinformation image? Where did it come from? Did a propagandist simply make it up out of thin air, or did it spring from some other source? I have no final answer to this question, but a year or so later, when I was reading Michael Voslensky's work, *Nomenklatura: The Soviet Ruling Class*, a particular passage leapt out at me. Voslensky, in quoting a 1920s account about the Cheka (the earliest forerunner of the KGB), recounted various Cheka methods of torture and execution of their victims. One such method was

reported this way: "at Voronezh they put their victims naked in barrels spiked on the inside and rolled them."³ This account and recent Soviet disinformation against religious groups are separated by more than one-half century. Are they somehow related, or did later Soviet propagandists simply make up the recent vicious accusation out of thin air? One cannot be certain, of course, but I would posit this as a possible example of a mirror image projected out of the past.

Zionism and Nazism

In examining the concept of ultimate enemy in Soviet propaganda, we might also consider Soviet disinformation that compared and linked Zionists with Nazis. One would be hard-pressed to find a more vicious lie, but such comparisons fit Soviet concepts of the ultimate enemy very well. They also furthered Soviet foreign policy goals in the Middle East. Virulent anti-Semitism was imbedded in Soviet society, along with fears of a Jewish conspiracy dating back to the fraudulent Protocols of the Elders of Zion. There was also the memory of Nazi fascism, which cost 20 million Soviet lives during World War II and the fear that German revanchism would once again rear its ugly head. Soviet propagandists simply combined the two images.

What this tells us is that the Soviet propaganda machine (regardless of its short-term goals for the propaganda, such as defaming Israel in third world countries) was itself convinced that there were many real enemies, both within and outside the Soviet Union.⁴ These were then reduced to extremely crude and violent images and made a part of an ongoing international conspiracy. They probably also believed that such ultimate enemy projections were both necessary and useful for their own population. While many societies resort to ultimate enemy projections and stereotypes in propaganda during wartime, the Soviet Union appears to have been one of the few nations to do it consistently over time during periods of peace.

As a footnote, one might consider how sensitive the Soviets themselves were to being stereotyped in the West. The TV series "Amerika" showed the Soviets as adversaries, but adversaries possessing many human characteristics—a far cry

from the ultimate enemy. Yet the program was denounced in almost apocalyptic terms by Soviet spokesmen-and threats were made prior to its airing. Soviet propagandists continued to show daily hatred against the West on a massive worldwide scale, with only an occasional protest from the West when the results of a given lie would have had serious and undeniable consequences.

The Invasion of Grenada

In late 1983, the Soviet newspaper *Izvestiya* not only attacked the United States for invading Grenada but also accused US forces (allegedly quoting the Mexican newspaper *El Dia*) of using chemical weapons to poison some 2,000 Grenadens, including women and children, and of recording their suffering and deaths on film. This gruesome fabrication, which was read by millions of Soviet citizens, further stated that the bodies were shipped back to the United States for additional study. The author of that article was A. Kuvshinnikov.⁵

For a long time I tried to discover who A. Kuvshinnikov was or is, or whether it was a pseudonym. Then another article by A. Kuvshinnikov appeared in *Izvestiya* on 21 August 1987. This article was said to be from the US correspondent at the USSR Foreign Ministry Press Centers. It is likely that these articles were written by the same person. In his especially pernicious article about Grenada, Kuvshinnikov attempted to set up a parallel between the WWII Nazi death camps with their human experiments and the US invasion of Grenada. This is another example of the ultimate-enemy image. No citation was given for *El Dia*, which was described by *Izvestiya* as an influential Mexican newspaper.

Soviet propagandists apparently believed that their audience would accept such base lies to some extent. And were these articles also designed to mitigate the effect of certain Soviet actions? In my opinion, they may tell us in part what the Soviets themselves have done or are capable of doing. The horrors of Afghanistan, as recounted by refugee survivors of Soviet atrocities, come to mind. Were the consciences of some Soviet veterans returning from Afghanistan (who may have

participated in brutal crimes against civilians) eased when they thought the United States had done worse?

Mirror imaging in Soviet propaganda is, I believe, an analysis area of great value to all who study the former Soviet Union-especially those who seek to understand the nature and depth of Soviet PSYOP.

Indoctrination of Hate

Lev Yudovich

Soviet military doctrine required the soldier to develop a strong feeling of hatred. This hatred was cultivated so the soldier would (1) believe in victory, (2) be willing to act in a dangerous situation, and (3) be psychologically prepared to operate under the conditions of modern war.

In case of war, the Soviet soldier will face a strong and brutal enemy who has been well indoctrinated in a spirit of irreconcilability toward the Soviet people. The Soviet soldier must therefore have a clearly defined attitude for the enemy: hate, contempt, and a feeling of superiority over them. We must show the soldier the strong and weak points of our enemies. We have to define the enemy in terms of his psychological characteristics (or stereotypes) that are related to his nationality or ethnic group.¹

The Soviet soldier was constantly being indoctrinated to develop hatred for the West. The indoctrination of hate started with the myth of a US threat to the Soviet Union. This myth allowed Soviet political and military leaders to keep the entire country in a state of tension and stress. The myth also made it easier to justify military spending and the consequent lowering of standards in domestic life. The American threat to the Soviet Union was the fundamental thesis of Soviet propaganda.

The aim of Soviet propaganda was to create a stereotyped pattern of thinking and reacting. The myth helped Soviet military and political leadership instill prejudice in the soldier. He was trained to become suspicious of foreigners and their way of life. His suspicion and deep distrust became the basis for hate. According to the Soviet view, "the political myth is an

This article provided courtesy of the US John F. Kennedy Special Warfare Center and School, Fort Bragg, North Carolina. Part of an original work titled, *An Assessment of the Vulnerability of the Soviet Soldier*.

ideological tool of the imperialists and a tool for psychological manipulation of the masses" (Col Gen D. Volkogonov). Thus the Soviet authorities use the very same technique that they accuse the enemy of employing.

The Soviets instilled hatred for the United States even in peacetime. They justified this approach by explaining that, in the past, the final moral hardening of the soldier could be achieved during the course of combat. In the future war, however, there will not be enough time for psychological preparedness. The soldier must, therefore, be prepared through training. He must put aside any moral convictions he might have and be oriented only toward accomplishing his mission.

Hate produces excitement and excitement can overcome the soldier's fear. To develop hatred, political workers used a wide variety of indoctrination methods (e.g., discussions in small groups, lectures, and political reviews) and every form of media. Deception, falsification, discreditation of Western leaders, and even cartoons became methods for building up hate. The US soldier was shown as a hireling, a mercenary, and a freelance murderer with a very low moral level. He had no convictions, and his main reason for fighting was to get money. The Soviets stated that the US soldier was not reliable in Vietnam. As the military situation in Vietnam got worse, said the Soviets, there were more deserters, and racial tensions increased. The reason they presented such distorted views was simple—to cultivate hate.

In 1952 the Military Publishing House of the Ministry of Defense of the USSR published a book written by Col Polkovnik B. W. Karpovich titled *The Ideological Indoctrination of Soldiers in the Armies of the United States and Great Britain*. This book was aimed at military readers. The author pictured American soldiers as fascists and animals.² When a young man enters the US Army, he stated, all training is aimed at turning him into a skilled murderer.³ American officers encourage US soldiers to be murderers and rapists. In the Korean War, according to the colonel, all American soldiers raped Korean women and girls, and officers created special brothels in which Korean women were forced against their will to provide sexual services for the soldiers.⁴ American soldiers,

he said, far exceed the Nazis in their gangsterism, brutality, and greed.⁵

Although those statements were made around 1952, this method of describing American soldiers persisted. Despite détente, indoctrination of hate continued. In 1986, for example, the Main Political Administration ordered the use of a film, "Hate the Imperialists,"⁶ and a 1968 article, "The Psychology of Murder and Torture," which purported to picture the American soldier.⁷ Political workers indoctrinated hate during every major maneuver from Dnepr to Shield '84.⁸ One dramatic example of such indoctrination utilized the site of Nazi victims' mass graves. Veterans and former partisans assembled for ceremonies at those sites and stated their recollections of Nazi brutalities. The political workers pointed out that imperialists had produced these atrocities and had also committed acts of brutality in oppressing national liberation movements that developed in other countries. These comparisons were used to unmask the imperialistic threat of Soviet enemies-the Americans.

Political workers in the Strategic Rocket Forces used every moment of their contact with soldiers, even appealing to the soldiers while they were on combat alert duty. Soldiers on duty in underground rocket bunkers were visited by political workers.⁹

Even in the face of new political thinking aimed at reducing the mutual military threat of the Soviet Union and the United States, the Soviets continued to instill hatred for Americans in their regular indoctrination programs. For example, a Soviet military journal included an article stating that hatred should be developed because "hate is the most important quality of the soldier and sailor since it promotes vigilance and combat readiness. Our hatred for imperialist plunder has deep roots. Our class adversaries are stained with the blood of millions of Soviet people who were killed during the wars initiated by imperialist aggressors. These imperialists are responsible for the trouble and suffering of millions of people all over the world. Our right to hate the imperialists is justified by their current blood policy and their intent to invade our homeland with weapons of mass destruction."¹⁰

The Soviets were developing not only hatred but also arguments to justify it and explain to the Soviet soldier why he should hate the Americans. An important reason for hatred was to overcome the Soviet soldier's interest in the American lifestyle and any sympathy he might have for such American items as jazz, cars, and freedom to travel. Hatred was used to build up a distrust of everything foreign.

During the fifties, there was little difference between the Soviet military evaluation of the American soldier and the evaluation used in propaganda. Both evaluations were summarized by F. O. Mikchei: "American soldiers are very dynamic and have good technical skills, but they lack discipline' and have low moral qualities. They have only a narrow political mental outlook.'" In the seventies, that evaluation started to change.

The majority of Soviet military writers pointed out that, in a future war, American soldiers would be well indoctrinated for fighting the Soviet Union.¹² "The future war will be very severe because the American soldier has a very strong anticommunist view. He is aggressive and ready to carry out his officers' orders. He is ready to be exposed to reasonable risks. He is obsessed with the idea that he is a superman. However, he is a selfish person, wants to make a profit, uses drugs and alcohol, and he is inclined to desert."¹³

Although Soviet military leaders changed their assessment of the American soldier, Soviet propagandists clung to their old picture of the American military gangster-murderer. Because the good fighting quality of the American soldier was recognized, propaganda was increased. Every attempt was made to show that the American soldier was actually an object of scorn. The propagandists stressed the message that the American soldier must be thoroughly hated. Such hatred produced the Nazi holocaust.

Intelligence and Psychological Operations

Col Joseph S. Gordon, USAR

Intelligence is an inextricable element of PSYOP in all phases of its activities, from the planning and conduct of operations to the evaluation of its effectiveness. For this discussion, PSYOP intelligence includes that which is generated by a PSYOP organization's own research and analysis assets as well as the intelligence which is obtained from other agencies. The major areas of intelligence activities in support of PSYOP are research, target analysis, pretesting and effects analysis, and propaganda analysis. ¹

Research

Research is geared to support the mission of PSYOP, which is to create in hostile, friendly, or neutral foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives. The effective PSYOP campaign requires systematic research of the highest scholarly standards. Intelligence required for PSYOP can be divided into two categories: basic and current.

Basic PSYOP intelligence consists of general information on such topics as the history, society, politics, economy, communications media, and military forces of a given country or region. Such information is kept in files of pertinent documents and a library of area studies books. When time and resources permit, the general information is digested in the production of studies that are tailored to support PSYOP. One example is the basic PSYOP study, which supplements area studies by focusing on relevant PSYOP issues, defined as highly emotional matters, deeply rooted in a particular country's history, customs, fears, or foreign policy. The issues

are selected largely for their ability to support PSYOP objectives that are classified as either cohesive or divisive.

Cohesive issues exploited could help strengthen or more closely unite the total society or particular target group. Divisive issues exploited could contribute to the separation of a group from the greater society or to the disorganization of a people. The basic study should also provide information on national symbols, emotive music, or pertinent graphics that could be used in the development of PSYOP materials. PSYOP intelligence analysts also produce special studies in response to timely events or to the need for greater focus and depth on an aspect of a country or society not covered elsewhere.

Current intelligence is obtained from all possible sources and is used to update studies and files. Should a PSYOP campaign be implemented, it is essential that current intelligence be considered to ensure that the issues already identified still pertain and that the themes and materials developed for use in the campaign are still valid.

The sources of PSYOP intelligence are diverse. But most of the intelligence required to conduct PSYOP is generally obtained from unclassified sources: newspapers, magazines, books, academic journals, studies, and foreign broadcasts. Classified reports on pertinent subjects are distributed to PSYOP organizations. Such organizations may also request intelligence collection for specific items of factual information.

Liaison with other agencies outside the Department of Defense (DOD) often can produce valuable information. Some agencies that can assist PSYOP in obtaining information about local conditions in foreign areas include the Central Intelligence Agency (CIA), Department of State, Foreign Broadcast Information Service (FBIS), the Library of Congress, and the US Information Agency (USIA). USIA not only conducts public diplomacy, telling America's story to the world, but it also undertakes extensive foreign media analysis, audience research, and public opinion polls. Finally, human intelligence is important-especially to gather information about denied areas in both peace and war. The sources of human intelligence include emigres, refugees, and prisoners of war.

No discussion of intelligence research is complete without mentioning the qualifications of the analyst. Because PSYOP

demands extensive knowledge of the history, politics, society, economy, culture, and military affairs (to name a few) of a given area, research is usually a team effort. However, the individual analyst qualifications should include mastery of research and writing techniques, earned advanced academic degrees, considerable experience living in a foreign culture, and knowledge of languages pertinent to the region. The complete analyst should also be able to read the French and German languages, and should have as much information as possible on countries of the third world. Highly capable intelligence analysts are essential for a successful PSYOP program.

Target Analysis

The intelligence effort in target analysis can be divided into five elements, the first of which is to determine key audiences. Based on systematic research, one determines the major elements of a given society delineated by such factors as geography, ethnic origin, religion, race, economic status, and social position. Two basic criteria are used to select PSYOP targets. One must first consider the importance of the target to the PSYOP mission, then the probability that the target can be moved to support the objectives of the campaign. In other words, one asks whether the target has influence and whether it can be persuaded to use this influence in ways that would aid US national interests.

The second element of target analysis is to determine the attitudes of key audiences. Basic research provides intelligence on long-standing attitudes toward political, military, economic, and social subjects. This information is refined as much as possible to delineate the views of various age cohorts, social strata, and occupational groups.

The third element is an analysis of current vulnerabilities within specific audiences-in essence, an updating of the preceding element to determine the level of dissension, fear, or complaints at the time of the PSYOP campaign. When properly assessed in a timely manner, such fears and anxieties can be exploited as target vulnerabilities in a PSYOP program.

The fourth element is a decision regarding message content and means of communication. The vulnerabilities and attitudes of the target provide a foundation on which to build thematic materials for a PSYOP campaign. These materials must support the plans and policies of the campaign, and the vulnerabilities/attitudes they are based on must be an accurate assessment determined by scientific analysis and evaluation. Further, it is essential to determine which means of communication (e.g., radio, television, leaflets, face-to-face) are most capable of reaching the target.

The fifth element of target analysis, testing the contents and measuring the effects of a PSYOP message, is an extensive one. It requires a separate discussion.

Pretesting and Effects Analysis

The pretesting of PSYOP materials is a crucial phase of a campaign. It is good to determine in advance that the message is clear and potentially effective. It is also good to avoid the small errors, which are easily made, in idiomatic language or cultural incongruities that can immediately destroy credibility. There are several methods for pretesting PSYOP materials, many of which can also be used to analyze the effects of communication. But testing is usually highly problematic in that the targets of the campaign are generally located in denied areas. To partially compensate for this problem, prisoners of war, refugees, or other emigres from the denied area can be utilized.

The general sample survey is perhaps the best systematic method for determining the effects of media content. It can be used before, during, and after a PSYOP campaign. The survey involves asking significant questions of a relatively small sample of scientifically selected persons to ensure representativeness. This technique determines whether the message is understood, credible, evokes the desired response, or has provoked undesirable effects.

Another method of testing PSYOP material is the panel, which differs from the survey in that the panel participants are repeatedly questioned at regular intervals in the course of the campaign. There are at least two variations of this technique.

One variation involves choosing a small group of people to represent some larger population segment. The success of the representative panel is, of course, dependent on the selection process. Success also requires rather free access to the audience. The second variation attempts to compensate for the lack of access by assembling a group of knowledgeable panelists to discuss the merits of the PSYOP materials in question. The discussion panel has a weakness, however: significant views can be suppressed by peer-group criticism.

A final method of testing is the individual interview. Ideally, it should be performed by a trained psychologist. The main purpose of the individual interview is to obtain insights into the deeper meaning of events and to clarify the mechanisms by which these meanings are formed, perpetuated, and changed.

Measuring the effects of a PSYOP campaign is a most complex and frustrating task. One is reminded of the Madison Avenue executive who lamented that half of his firm's advertising was effective, but he did not know which half. The above-mentioned techniques of analysis can also be used in an attempt to determine the effects of a campaign. There are also two other indicators, the first of which is physical response to the campaign. If the audience acts as the PSYOP message suggested (e.g., to defect, surrender, or cause a disturbance), there is evidence of effectiveness. One must be aware, however, that this action could have been caused entirely or in part by other factors. The other indicator of PSYOP effectiveness is through analysis of the opposing media. By monitoring the press, radio, propaganda, and other documents and publications, one can find evidence of the opposition's response to our campaign.

Propaganda Analysis

Analysis of propaganda is most valuable for a number of purposes. Examination of the opposition's domestic propaganda that directed at its own population can be exploited in two ways. First, it can reveal general intelligence about the political, economic, social, and military situation in a given country (if not the possible intentions of action in a given situation).

Second, domestic propaganda in revealing such information may also disclose vulnerabilities that can be used in our PSYOP campaigns. Further analysis of external propaganda directed at our side can serve as a basis for our own counter-propaganda activities as well as a basis for our public information efforts to defend against the effects of opposition propaganda or our own population or armed forces.²

Regardless of the purpose or kind of propaganda, one focuses basically on seven questions in its analysis. What is the source? What is the objective? Who is the target? What attitudes are being exploited? What techniques are used? What media are employed? How successful is the propagandist in accomplishing the objective?

Although these analytical questions may seem rather simple, answering them can require sophisticated examination of the propaganda materials. It is not sufficient to merely deal with the themes and the logic conveyed in the propaganda message, one must pay much attention to the psychological meaning of the total package, including its symbols, use of language, and other emotional accouterments. One should be thoroughly familiar with the myriad of propaganda techniques (one author listed 77 different ones). Our counterpropaganda and public-information efforts must deal with the techniques as much as the themes of opposition propaganda if they are to be effective.

Although good intelligence is important in all military operations, it seems even more important to PSYOP. It is critical throughout the spectrum of operations from the initial planning to the campaign evaluation. PSYOP is not only a user, it is also a producer of intelligence. It is capable of contributing to the overall national effort as well as servicing its own needs.

Notes

1. A valuable source of this paper was Ronald D. McLaurin, ed., *Military Propaganda: Psychological Warfare and Operations* (New York: Praeger, 1982). Especially useful was Part IV: "Intelligence and Research," which included among other pertinent articles the following: Philip P. Katz, "Intelligence for Psychological Operations," and "Exploiting PSYOP Intelligence

Sources," 121-54. Also very useful was Department of the Army Field Manual (FM) 33-1, Psychological Operations, 1979.

2. In addition to FM 33-1 cited above, the following works were consulted for propaganda analysis: Leonard W. Doob, *Public Opinion and Propaganda* (New York: Henry Holt, 1948); D. Lincoln Harter and John Sullivan, *Propaganda Handbook* (Media, Pa.: 20th Century Publishing, 1953); and William Hummel and Keith Huntress, *The Analysis of Propaganda* (New York: William Sloane, 1949).

What the US Information Program Cannot Do

George V. Allen

An international information program cannot change the basic attitudes and opinions in foreign countries.

One of the great American fallacies is the notion, prevalent among people in all walks of life, that we need to explain ourselves, our policies, and our way of life to foreign peoples so they will love us-or at least will understand and sympathize with our point of view. I submit, however, that this point of view is not realistic and that those in the academic world and other professionals in communications should be tough-minded enough to face certain facts squarely and realistically.

While I was director of the United States Information Agency (USIA), I was often asked by congressmen to explain why the "Voice of America" (VOA) seemed to have difficulty in getting the American story across to the people of foreign countries. It should be very simple, I was told. You need to explain that the American way of life-including our democratic principles, our respect for human rights, and our private enterprise-has produced the highest standard of living in the world. Everybody admitted that not only the upper strata but the common man in the United States had more of the good things in life-more shoes, clothes, leisure time, music, vacations, and opportunities for advancement than people of other countries. Why can't you just keep pointing that out to them on VOA?The job should be easy.

However, Uncle Sam was regarded as Mr Rich. We were presumed, with some justification, to want things to remain

Excerpts from John Boardman Whitton, ed., "What the U.S. Information Program Cannot Do," *Propaganda and the Cold War* (Washington, D.C.: Public Affairs Press, 1963). Reprinted with the permission of the Public Affairs Press, copyright holder.

more or less as they were. We talked a good deal about evolution instead of revolution, and we made it clear that we did not want the government of Cuba to seize American-owned sugar refineries or other American property without adequate and prompt compensation. We insisted on reforms (e.g., Latin America under the Alliance for Progress) but we wanted them to be instituted by orderly legal process while the miserably poor wanted to turn the world upside down overnight. They regarded the United States as basically in favor of the status quo. (All rich people are supposed to be that way.)

More significant, perhaps, is the fact that Moscow was regarded by most of the poor people around the world as the friend of the poor and of the rebel. When one asks how it is possible that so many Cubans were attracted towards Moscow rather than the United States, the painful but realistic answer is because they thought Moscow was more likely to support them than we were. Demagogues such as Fidel Castro or Juan D. Peron, who depended for their chief support on the rabble, were likely to shout defiance at Uncle Sam-and their followers were likely to cheer them for it.

The "Voice of America" could not change the basic fact that the US was rich while most people in the world were poor. The more we talked about our high standard of living, the fewer friends we had.

What is the answer? For those of us concerned with communications, we must recognize the facts of life. We must try to see ourselves as others see us. We must understand *their* motivations and reactions as we try to help them understand ours. We have put too much emphasis on explaining our point of view and not enough on understanding theirs.

Let us turn now from economic to political matters. One of the principal foreign policies of the United States has been the decision to participate in and foster collective security for the nations of the free world. The purpose of the USIA, in the words of President Eisenhower shortly after the agency was established in 1953, "shall be to submit evidence to peoples of other nations, by means of communication techniques, that the objectives and policies of the United States are in harmony with and will advance their legitimate aspirations for freedom, progress, and peace." In other words, we must make our

policies as convincing and acceptable to foreigners as we can, presuming that our policies are in harmony with their proper aspirations.

I was in India when the United States gave military aid to Pakistan under our collective security policy. The archangel Gabriel could not have made this palatable to the Indians or convinced them that it was compatible with their aspirations-legitimate or otherwise. There was no policy we could have adopted that could have convinced both sides we were their friends.

The heavy responsibilities of the United States sometimes require us to take positions that please nobody. There is danger in expecting too much of communications techniques. I was once told that only the VOA could win the Berlin dispute!

There is a tendency for college professors to claim too much for the growing field of communications (sometimes improperly called psychological warfare). Many universities are rapidly developing studies, and even faculties, in this specialized field. But if those in the academic world and we in government overstate our case for communications, we are likely to make trouble for ourselves. Propaganda can do little to remove the basic problems of the have-nots, the national rivalries of Pakistan and India, or the racial animosities of Africa. And whatever communications can do will take a long time. Like education, communication is not likely to avoid takeovers in third world countries.

We must put forward an honest, objective, and truthful information program and then make it available in comprehensible terms to as many people as possible by the most effective media. Then we must rest our case with the common sense of mankind. I suppose one must have a mystic faith, as Jefferson did, in the ability of the common man to make a right decision when given adequate information and freedom of choice. If you do not have this faith, I doubt that you should be in the communications field.

Let me repeat, however, that we must be realists. Nations will be saved from aggression by a combination of forces, including political, economic, psychological, and military-the latter being possibly the most significant in our present sad state of international chaos.

Defector Operations

Lt Col John Ozaki, USA

Defector operations must be carefully planned and coordinated at all levels.

Because of the economic and political instability that prevails during internal defense operations, many insurgents can be persuaded to return to their government's cause if a sound defector plan is instituted. The successful campaign against the Huks in the Philippine Islands and the more recent Chieu Hoi (open arms) defector program in Vietnam tell us it is possible to formulate a defector program for internal defense and development. Success, of course, depends upon proper implementation.

The successful defector program requires national coordination, and it should have the objective of supporting the existing government. Specifically, that objective may be met by any of the following:

- **Inducing the maximum number of insurgents to discontinue voluntary support of the insurgent program and to support the legally constituted government.**
- **Exploiting for intelligence and psychological operations those individuals who have returned to the side of the government.**
- **Fulfilling promises to defectors by providing to them and their families security and economic support, to include vocational and job opportunities that help them become self-supporting.**

Reprinted by permission from *Military Review* 49 (Fort Leavenworth, Kans.: Army Command and General Staff College, March 1969), 71-78.

- **Enlisting the defectors for specialized jobs and units where their knowledge of the enemy's techniques can be utilized.**

To increase the chances of a successful defector program, US representatives to the host country at the national level should seek approval of the following policies, especially in cases where the United States is advising a host country on military matters:

- **The host country should' establish an agency to be responsible for execution of all aspects of the defector program, which should be equal in status to major components of the government such as the military departments and the national police. This agency's organization should function on the principle of centralized direction and decentralized execution from the national to the lowest level.**

- **US agency responsibilities and policies for defector operations must be clearly established from the national level down to receipt of a defector by a combat unit.**

- **Combined agreements should be made whereby a review of performance can be accomplished for the purpose of replacing ineffective administrators.**

- **The responsible US agency should have control of funds provided by the United States that are used in direct support of the defector program.**

- **Combined civilian and military counterparts should be established at each level where major defector operations take place. These would include district, sector, regional, and national levels as appropriate to the territorial organization of the country.**

The objective of the inducement program is to prepare the members of the insurgent forces to quit their cause and join the legitimate government. The overall effect lets the insurgents know that the government is aware of their plight and wants to forgive and welcome them back. Closely associated with this program is the requirement of informing loyal citizens and military organizations about the program. These are the groups that play an important role in the rehabilitation of the defectors. The loyal citizens must accept

the defectors back into the society or the defectors will probably return to the insurgent side.

Inducement operations are the responsibility of PSYOP personnel although intelligence organizations also play a major role in this part of the program. The intelligence community provides PSYOP personnel with information gained from interrogations designed to determine why insurgents have quit their cause. If feedback provided by intelligence is timely and valid, this information can be used to induce more insurgents to quit their cause. Intelligence organizations benefit from this type of mutual support because, with more insurgents defecting, there is the probability of increased intelligence.

Themes

Before a PSYOP program is implemented, a careful analysis is made to determine the vulnerabilities of the insurgents. Common vulnerabilities of insurgent forces are hardships, disillusionment because of slow progress, and fear of getting killed. To be effective, the term *hardship* must be translated into meaningful facts such as insufficient medical services, low pay, and long family separations. The success of any PSYOP effort depends on close coordination with intelligence agencies.

Maximum use of radio, loudspeakers, newspapers, leaflets, and other publications will be the mainstay in the dissemination link. The PSYOP operator, however, constantly seeks new and unusual techniques to spread the word of the government concerning the promises of the defector program. Innovations such as badges, postage stamps, and imprinted balloons publicize the defector program. Encouraging local government officials to speak about the program may also help.

PSYOP Utilization

Former insurgents are used to the maximum extent possible in inducement operations. They are extremely effective in developing PSYOP material because they know the environment and the modus operandi of the insurgent. If defectors are

integrated into the PSYOP effort, their knowledge of the habits, customs, and idiom of the insurgents will make the PSYOP effort more effective. Additionally, these individuals are used in evaluating PSYOP material before it is disseminated.

Small units of armed defectors are organized to perform propaganda missions in locally contested areas. Such units are effective because they speak with firsthand knowledge. For security purposes, selected individuals of known loyalty are incorporated in these special units.

An effective system of rewards is one of the most important aspects of a defector program. Rewards are coordinated to ensure that each defector is paid for the assistance he provides to the government and that the pay is equitable. A central office monitors all rewards and establishes a well-publicized standard scale to ensure that rewards are in line with those previously paid. Defectors are questioned to determine whether they have received all rewards due them.

Speed in making payment is necessary so that the impact of the deed is not lost; consequently, funds should be made available to local officials so that rewards can be paid immediately. When security permits, rewards should receive wide publicity so all can see that the government lives up to its word. This added emphasis may induce other defections, particularly when large sums of money are involved.

Exploitation of the returnees involves obtaining information, disseminating the intelligence derived from this information, and using the intelligence to defeat the enemy. The following major considerations concern the exploitation of defectors:

- Treatment promised to returnees must be delivered. Initial reception is particularly important because it has an important bearing on how much an individual will contribute to the government. A returnee who is properly treated may even volunteer for intelligence and PSYOP roles. On the other hand, an individual improperly treated becomes an easy target for reindoctrination by antigovernment forces.

- Qualified interrogators are available at the lowest level possible, which is important because of the insurgent's characteristic of frequently moving. It is imperative that defectors be interviewed within the first few hours after

defection to determine their knowledge. Interviewers also need the necessary communications to disseminate information to responsive units. When the number of qualified interrogators is limited, consideration should be given to pooling and dispatching them by air as the situation requires.

- Security must be provided for both the defector and the defector's family. Insurgent forces are likely to place maximum effort on retaliating against a defector (and the defector's family) to discourage other defections.
- Clearly defined policies on exploitation must be established.

One of the major problems confronting a commander is that many of his officers and men will not trust the returning defectors. To counter this logical distrust, the commander implements a massive command information program that includes handling, treatment, and use of defectors. Experience proves that one of the best ways to reverse the feeling of distrust is to publicize the help that defectors give to the friendly forces. The returnee's knowledge of the insurgents' tactics, terrain, and current situation is invaluable to the countering forces.

One of the government's most difficult tasks is to identify the enemy and the defector is often the only person who knows the enemy; consequently, a major task of friendly military personnel is to exploit this knowledge. Former insurgents may be used as scouts, guides, members of collection and reconnaissance units, and monitors for interpreters.

Special interrogation procedures are necessary for working with a defector. Experience has shown that most defectors will talk freely without the use of pressure. Generally, the best technique is to employ the interview method. The interviewer first must gain the confidence of the defector, and interviews should not be continued unless the interviewer believes that good rapport and communication have been established. Because most defectors are highly apprehensive immediately after their escape, it often requires several interviews to establish communication. It may be useful to have earlier defectors talk to all new returnees, telling them that they have made the right decision by defecting.

The interview environment is extremely important. Although a private room is desirable, elaborate equipment is not

necessary. With new defectors, it is helpful to have intelligence requirements mentally fixed so that resort to paper and pencil is not necessary. The defector should be convinced that he is important and has valuable information that can be used to help defeat the enemy.

Rapid and accurate interrogation of knowledgeable returnees is necessary if effective exploitation is to be accomplished. Generally, the best procedure is to use normal military communications to report information gained from interrogations. Communications between police, government officials, and other sources are coordinated because many insurgents defect to governmental agencies other than military units. Reporting by those agencies helps to speed information to the user.

If the country is so organized, there is a military reporting headquarters at district, province, and region. Forms used for reporting must be simple, and some basic information should be reduced to blocks for check marks. It often will be beneficial if the forms are bilingual.

Intelligence agencies keep the lower echelons informed of any special requirements so that special reports can be forwarded. Each echelon in the reporting channel keeps a reference file on all defectors. The file contains basic information, such as date of rally, area of operation, former job with insurgents, special knowledge, and disposition. The information is readily available so that an individual can be quickly located for exploitation at any time.

Security

Security for defectors is essential. If the exploitation program is working well, the insurgents will counter it with attacks against individual returnees and compounds where returnees are kept. Normal active and passive security measures are improved by organizing the defectors into self-defense units. Special protection is given to high-level defectors—perhaps evacuating them from the immediate battle area even though they may be able to provide exploitable tactical information.

Special consideration must also be given to a defector's family. Immediately after a person defects, the family should be located. If they are in an enemy controlled area, their identity may have to be concealed before the defector can be exploited. When defectors cannot be exploited because of the family's location, plans should be made to evacuate the family to a secure area.

A successful defector program includes effective means for returnee rehabilitation, a phase that requires national support. Planning and coordination of national resources are required when jobs, arable land, and educational facilities are to be provided.

Reception Centers

Rehabilitation begins at the reception center as soon as a returnee has been exploited for intelligence and PSYOP. Centers are established in secure areas near the defectors' homes, if possible. It is of utmost importance that all promises disseminated by the PSYOP program be fulfilled as soon as possible.

A new returnee is made to feel welcome. Experience has shown that an effective way to help a new returnee overcome initial shock is to assign him a sponsor-a returnee who has been at the center for some time. A special ceremony (such as a retreat formation) is held to introduce this individual to the rest of the group. In addition to temporary jobs, such as sponsoring members, returnees are hired to fill as many of the permanent administrative jobs at the center as possible. They know the problems of the returnee; therefore, they are very effective in rehabilitating the former enemy.

While at the centers, individuals are given reindoctrination courses on government objectives and the responsibilities of individual citizens. Detailed programs of instruction are centrally prepared, and supporting reference materials are provided to the rehabilitation administrators.

Vocational training may be centralized because of limited facilities and qualified instructors. This training is on a voluntary basis, and national coordination is required to

ensure that those individuals who successfully complete vocational training become gainfully employed.

To assist in their own protection, defectors should be organized into self-defense groups. The rehabilitation complex should be tied into the defense plan of the area, with some government forces placed in the center or located close by. Within the center, planted returnees are used to determine whether the enemy is trying to infiltrate the program. These specially trained individuals determine whether the center is providing the defectors all benefits due them. They also evaluate the center's overall effectiveness.

The defector program must include a follow-up phase to determine whether the defectors are remaining loyal to the government and becoming self-supporting. Field representatives working with the police receive information from defector program administrators when defectors have moved into their areas. These representatives determine what problems, if any, the defectors are having in being accepted by the general population. As a minimum, a system must be established whereby a former insurgent is required to register with the police in the area where he resides. The police would then be responsible for the security and surveillance of these individuals.

Returnees whose home areas are under insurgent control may require temporary homes. It is not advisable to place them in defector villages because they then become easy targets for the insurgents, which makes it harder for them to be accepted by the general public. Defectors resettle where they can find employment in trades learned during the rehabilitation portion of the program.

History demonstrates that a sound defector program is a valuable aid in defeating an insurgent movement. A good defector program supports the existing government by reducing the number of active insurgents, gaining support from the general population, and providing information that can be exploited to defeat the enemy. A good defector program is another form of combat power. To neglect it invites a longer conflict and unnecessary casualties.

Tactical PSYOP and Strategic Objectives

Ronald D. McLaurin

Exploitation *of* tactical opportunities for strategic PSYOP can be crucial to achievement *of* long-term goals.

A major cause of disaffection from the government during the early years of the Hukbalahap insurgency (1946-64) in the Philippines was the mistreatment endured by the populace at the hands of Philippine security forces. Accounts of individual abuses by police powers in the Philippines are legion. From independence until 1950, the poorly trained security forces suffered from bad morale and worse discipline. In the field, troops typically foraged for supplies at the expense of poor peasants. Indiscriminate weapons firing resulted in unnecessarily high noncombatant casualties. Worse, the Philippine constabulary sometimes shelled whole villages when some residents were suspected of harboring or abetting Huks. Suspects were seized without due process of law, then beaten or otherwise treated inhumanely. Police corruption was widespread and resulted in such bitter, frustrating experiences for the peasants that many of them supported or joined the Huks.¹

After Ramon Magsaysay became secretary of national defense in September 1950, however, many important and effective steps were taken to protect noncombatants during tactical operations and to build confidence in their military forces.

The first step, an innovation in tactical organization, improved the supply situation in the armed forces. (Inadequate supplies had led to foraging by troops in the field.) The introduction of self-sufficient battalion combat teams (BCT) reduced the interdependence level, which had slowed army responsiveness. The BCTs displayed initiative, flexibility, and resistance to Huk intelligence-gathering. BCTs were "autonomous in almost

every sense except for strategic command, which was placed under the commander of the four military areas in the country."²

Second, in those cases where security forces abused their authority or did not treat civilians with respect, an effort was made to ensure that prompt and appropriate punishment was meted out. Because the objective was popular sympathy, not merely appropriate punishment, a certain degree of publicity attended these self-administered acts of justice on the part of the military.³

Third, civil affairs officers were attached to each unit to contact and work with the people-to inform them of the government's objectives and to make the military aware of the needs, interests, and problems of the local citizenry. This activity was designed to overcome the troops' previous lack of positive contact with the Filipino masses. It resulted in close relationships, more effective civic action programs, and better tactical intelligence. Civil affairs officers were also responsible in large measure for the implementation of the population protection program⁴

A further instrument to ensure that the armed forces acted with self-restraint toward the civilian population consisted of an arrangement with the Philippine telecommunications facilities whereby any citizen, for the equivalent of five cents, could send a telegram of complaint about troop behavior directly to Secretary Magsaysay's office. The secretary maintained a pledge to respond to each complaint and initiate an investigation into the circumstances that gave rise to it within 24 hours. The availability of this means to redress grievances, and the government's determination to follow through, were impressed upon the armed forces for maximum deterrent effect.⁵

Yet another change involved the dispatch of military doctors with individual units in the field. This function served both the military and noncombatants in the area. The doctors provided medical aid to civilians who were injured through either combat or accident. They also gave general medical attention to people who in many cases had never seen a doctor before.⁶

As the program to protect and work with the indigenous population progressed, even more flexible approaches were essayed in an effort to ensure the protection of civilians from

abuse, loss, or casualty during tactical operations. By May 1954, "the patrols were firing at the Huks only as a last resort."⁷ Through these and other initiatives, PSYOP at the tactical level contributed to the major strategic objective of the government reacquisition of the loyalty and support of the population.

PART IV

Case Studies
of
PSYOP Applications

THIS PAGE INTENTIONALLY LEFT BLANK

Introduction

These case studies present and clarify PSYOP goals, roles, and methods. Col Benjamin F. Findley, Jr., USAFR, condenses and analyzes US and Vietcong PSYOP in the Vietnam War. He analyzes the Chieu Hoi campaign, the vulnerabilities of the North Vietnamese army and the Vietcong soldier, and summarizes the key US and Vietcong PSYOP appeals and techniques.

MSgt Richard A. Blair, USAFR, and Col Frank L. Goldstein, USAF, 'present the Iraqi propaganda network used during the Persian Gulf' War. They explore Iraq's skill in creating and using a variety of media outlets, internally and externally.

Col Dennis P. Walko, USA, details tactical and consolidation PSYOP activities in Operations *Just Cause* and *Promote Liberty* in Panama. He presents major PSYOP lessons learned.

Laurence J. Orzell shows that Poland's underground media were nongovernmental PSYOP in action as well as a significant part of the Polish sociopolitical scene. According to Orzell, this underground media enabled the Poles to resist the enforcement of the adoption of communist ideals and values.

Colonel Goldstein refers to the 1986 Libyan Raid as a PSYOP effort and reports the results.

Maj James V. Keifer, USAF, Retired, discusses national anti-drug policy and relates the role of military psychological operations in solving drug problems.

The late Gen Richard G. Stilwell, USA, Retired, discusses the importance of the political-psychological dimensions of conflict and insurgency. He explores, through several examples, the failure of the American public, the media, and even our bureaucracy, to recognize and counter political and psychological warfare conducted against US policies.

In Major Keifer's second piece, he gives an overview of the psychological dimension of the Persian Gulf War relative to the diplomacy process and the quick end to the war.

Colonel Goldstein and Col Daniel W. Jacobowitz, USAF, Retired, in case studies on Operations *Desert Shield/Desert Storm*, support the urgent need to increase US sensitivity to the psychological dimension of warfare. They not only solidify the

PSYOP requirement but also point out our weaknesses and future challenges.

US and Vietcong Psychological Operations in Vietnam

Col Benjamin F. Findley, Jr., USAFR

This paper reviews and analyzes selected US and Vietcong PSYOP strategies, tactics, and problems in the Vietnam War. Included are the Chieu Hoi campaign, the vulnerabilities of the North Vietnamese Army and the Vietcong, and key PSYOP techniques of both the US and the Vietcong.

Coordination of Decentralized United States Psychological Operations Agencies

The US PSYOP effort during the Vietnam War was decentralized among the US Military Assistance Command, Vietnam (MACV), the US Information Service (USIS), and the Agency for International Development (AID). Each agency was responsible for one or more aspects of the foreign information/ PSYOP effort conducted in South Vietnam. The agencies "operated independently of each other," according to Ronald D. McLaurin of the American Institute for Research in Washington, D.C. In 1965 President Lyndon B. Johnson established the Joint US Public Affairs Office (JUSPAO) to integrate the PSYOP activities, to avoid duplication of effort, and to increase the overall effectiveness of the effort.

According to then 4th PSYOP Group Commander Taro Katagiri, the variety of agencies involved made it difficult to coordinate the PSYOP effort as well as to establish centralized control and direction in the Republic of Vietnam (RVN) in 1968-69. There were repeated examples of lack of coordination. Mr Katagiri recalled that on 16 February 1969 there was an airborne leaflet mission in which a total of 84,000 leaflets were disseminated without prior coordination with the area task force PSYOP officer. And US PSYOP teams sometimes

appeared at hamlets on audiovisual or loudspeaker missions only to discover a province team conducting a similar mission.

Roles and Goals in Vietnam

PSYOP responsibilities grew during the war without the guidance and control necessary to accomplish the corresponding goals. The breadth of American roles and goals led to rapid growth in the size of US PSYOP elements. PSYOP goals:

- 1. undermine popular support for the insurgents,**
- 2. enhance the image of the government of the RVN,**
- 3. increase Vietnamese understanding of, and elicit support for, US policies in Vietnam, and**
- 4. engender international support for US policy in Vietnam.**

Relatively few PSYOP-experienced personnel were available, however, and those few were spread among the many groups involved in PSYOP. According to MACV, the US PSYOP mission in Vietnam included the following entities:

- the American Embassy in RVN,**
- the Mission PSYOP Committee,**
- the JUSPAO,**
- MACV,**
- Civil Operations and Revolutionary Development Support (CORDS),**
- US Army Republic of Vietnam (USARV),**
- the 4th and 7th PSYOP Groups,**
- Naval Forces, Vietnam (NAVFORV), and**
- the Seventh US Air Force.**

In PSYOP Policy number 51, 28 December 1967, the JUSPAO Planning Office established the following PSYOP priorities:

- 1. the Government of Vietnam (GVN) image,**
- 2. Chieu Hoi (come home),**
- 3. revolutionary development (agriculture and improved living standards self-help projects),**
- 4. refugee program,**

5. public safety,
6. the US image,
7. GVN mass media advisory effort, and
8. telling the Vietnam story.

The Chieu Hoi Campaign

Two special PSYOP targets were the Vietcong (VC) and the North Vietnamese Army (NVA) soldiers in South Vietnam. Two Chieu Hoi operations carried out in the Delta during 1970 and 1971 proved that PSYOP and combat pressure working together could get results. The operations were Operation *Roundup* in Itien Hoa Province and Project *Falling Leaves* in Kien Giang Province. Operation *Roundup* produced hundreds of enemy defectors, according to Colburn Lovett, a USIS foreign service information officer. One PSYOP technique was to take pictures of ralliers/defectors and have them sign a simple message on a leaflet, encouraging their comrades to join the cause. Another technique was to use loudspeaker teams of former VC soldiers who were sent back into the areas of their units to speak to their comrades in the bush. Project *Falling Leaves* combined Vietnamese and US personnel working in joint PSYOP activities. Armed propaganda teams (100 percent ex-VC) made deep penetrations and extensive face-to-face communications. All possible media were used, including boat-carried loudspeaker teams, leaflet drops, radio tapes, and television appeals by former VC.

There are significant PSYOP lessons here for all commanders. During the two-month period in 1971 when intense PSYOP supplemented military action, there were 1,150 defectors, while in the six weeks before and the four weeks after the intensive PSYOP campaign, there were only a total of 211 defectors. PSYOP, if applied on an intense scale, is of significant value to commanders in securing the surrender of enemy forces. The author believes that military operations conducted without PSYOP support will not be as successful as those conducted with it.

A PSYOP project initiated by Special Forces in conjunction with a detachment of the 245th PSYOP Company, JUSPAO, and the Vietnamese Information Service (VIS) had as its

objective bringing Vietnamese government presence back to the area around Duc Co in Pleiku Province. The area had slipped into the contested category. Using the Duc Co Special Forces Camp as its base, the PSYOP effort was aimed at all of the villages and hamlets within a 10-kilometer radius. This Chieu Hoi campaign, adopted in 1963, offered communist soldiers forgiveness and exoneration for temporarily slipping into the alien communist path. They could return home to their families and the just cause of the republic. The term *surrender* was not used. Medics held sick calls over a four-day period to attract the sympathetic attention of the villagers. Over 800 villagers were treated during this four-day period. Face-to-face contact allowed the representatives of the VIS to stress the theme that the VC were preventing peace while the government of Vietnam was working for peace. Valuable information concerning the popular resentment toward VC methods came to light and the team members were careful not to make the same mistakes, particularly with regard to pressures exerted to bring villagers to propaganda sessions. At the end of four days, the operation was judged to be a success, so much so that the wives of eight VC persuaded their husbands to seek amnesty as Chieu Hoi returnees.

Vulnerabilities of the North Vietnamese Army Communist Soldier

The NVA soldier in South Vietnam presented a particularly difficult target for GVN/US PSYOP aimed at inducing surrender or defection. He had a relatively high state of indoctrination, which was reinforced by a range of psychological controls that included self-criticism sessions, the three-man cell, and endless repetition of communist themes. A contributory reason for the resistance of NVA soldiers to Chieu Hoi inducements was that defection for most did not hold the promise of an early family reunion. (Defecting Vietcong were South Vietnamese who were going home.) Moreover, unlike the VC guerrilla who may be a teenager conscripted from his hamlet and sent into battle without much party schooling or political indoctrination, the NVA soldier was the product of a closed totalitarian society. He had been subjected to com-

munist indoctrination from his earliest school days. This made him more resistant to PSYOP entreaties. Further, the NVA soldier found himself fighting in a region unfamiliar and semi-antagonistic to him, usually in relatively uninhabited areas and with little chance for contact with the civilian population.

US/GVN PSYOP messages pointed out three options: (1) to rally, take advantage of the Chieu Hoi program and quickly become a free citizen of the RVN; (2) surrender as a prisoner of war and await repatriation at the end of the war in the safety and relative comfort of a prisoner of war camp; and (3) counsel NVA soldiers to devote all their efforts to individual survival rather than getting killed or maimed for an unjust cause. Even a partial success in this PSYOP effort would contribute to shortening the war by reducing the combat effectiveness of NVA units.

The vulnerabilities of NVA soldiers did not change much throughout the war. Separation from families, the hardships of infiltrations, fear of allied arms, and, perhaps most significantly, the contrast between what they had been told by the cadre and what they actually experienced, were the major exploitable weaknesses.

The surrender program for the Northern troops (Chieu Hoi) received the greatest amount of American emphasis and money. Reception centers for defectors (hoi chanh) were built at various locations throughout the country. They usually remained in the camps from 45 to 60 days before being released and resettled. They were given rewards (e.g., money to buy food) for turning in their weapons. NVA soldiers realized that defecting might prevent them from ever going home to the North.

Key Psychological Appeals

According to Vietnam veteran and former Air Force intelligence officer Lt Col Robert Chandler, five major US PSYOP appeals were applied in Vietnam:

1. fear of death,
2. jungle hardships,
3. loss of faith in victory,
4. concern for family, and
5. disillusionment.

The aim of the fear appeal was to convince the enemy that he faced an overwhelming danger of being killed if he remained with the communists. Message themes included "death lurks everywhere," "born in the north to die in the south," and "no shelters are safe from the bombs of the B-52." Not all fear appeals were successful, however: In one appeal, fear leaflets imprinted with the ace of spades as a sign of death were dropped and decks of cards with prominent aces of spades were left along VC trails; unfortunately, Vietnamese card decks did not include the ace of spades. Another example of fear-appeal failure was the use of gruesome leaflets depicting corpses. This had a boomerang effect because the hoi chanh felt that the government was gloating over the deaths of fellow Vietnamese.

The hardship appeal reminded enemy soldiers of their loneliness, homesickness, poor living conditions, and insufficiencies in food and medical supplies. The "loss of faith in communist victory" appeal sought to convince the enemy that the Republic was winning the struggle. It emphasized battlefield losses and the number who had already rallied. The "concern for family" appeal, one of the most effective, was very emotionally based. Loneliness, nostalgia, and the desire to return home to loved ones were primary factors motivating communist soldiers to defect or surrender. The disillusionment appeal was based on the idea that the North Vietnamese soldier might be able to withstand fears and hardships as long as he was convinced that Hanoi's aims were just, but would be more willing to defect when he became skeptical of them.

Four special PSYOP techniques were employed in Vietnam: distribution of safe conduct passes, money for weapons, focus on returning home to celebrate during the Tet New Year, and armed propaganda teams composed of hoi chanh. Many PSYOP professionals believe these teams were effective because of their personal touch to the Chieu Hoi invitations.

Important Nonmilitary Considerations

There were several misconceptions about PSYOP. Taro Katagiri, former 4th PSYOP Group commander in Vietnam, believed that many people considered PSYOP a separate and

distinct activity, unrelated to other functions-especially in nonmilitary situations.

PSYOP was not amply exploited to support economic programs such as rural construction, political programs, medical assistance, or humanitarian efforts. Another misconception was that PSYOP involves just verbal communications and, thus, many Americans were insensitive to nonverbal gestures, posture, signs, and physical appearance.

An individual's response to persuasive communication in any culture is based on and reinforced by his regular interpersonal relationships. An individual usually consults a member of his/her primary group, a friend or relative, before taking action in response to persuasive messages. A great number of the VC rallied/ defected to the Chieu Hoi program through an intermediary who was a relative or trusted friend. Many did not defect until they received assurance from a relative or friend that the government would keep its promises concerning good treatment and other aspects of the amnesty program.

Cultural Considerations in Vietnam

For the Westerner, one of the most important elements to understand about Vietnamese culture is the completely personal basis of the society. "Truth" for the Vietnamese is not the factual statement or actual occurrence of an event; it is in the pleasantness of personal relationships. A Vietnamese's entire character lies in not giving or receiving personal embarrassment or shame. For example, it would not be culturally correct for a Vietnamese to shout at or reproach a waiter over bringing the wrong meal order.

He would either quietly request a change or simply eat the wrong meal and pleasantly smile. Understanding and progress are less important than pleasant associations. Distrust of strangers is a part of Vietnamese culture, and Vietnamese people politely keep their distances. Vietnamese answers to questions will reflect what the questioner may want to hear. A Vietnamese will avoid lengthy associations with strangers but will be pleasantly polite. The Vietnamese culture places a very high value on the family and on elder citizens.

Vietcong Techniques

According to Philip Katz, the reverse of the trusting value was used by the VC in their attempt to deter defection. His example is of a VC or NVA soldier who claims to his comrades that he was captured by the GVN or US forces and had subsequently escaped. He testifies that while a prisoner he was treated badly and that he had firsthand knowledge that the government of Vietnam did not abide by their good treatment promise.

Katz says that research findings substantiate the fact that intimate Vietnamese associates tend to hold opinions and attitudes in common and are reluctant to depart unilaterally from their group's consensus. They talk frequently among themselves and establish a trusting bond of friendship upon which to primarily base their decisions. Interpersonal communication is highly valued; mass media are of secondary importance. 1

Vietcong National Liberation Front

Douglas Pike presents the three VC PSYOP programs of dan van, dich van, and binh van. Dan van was the VC effort to develop support in areas that it controlled while dich van was the effort to develop support in GVN-controlled areas. Binh van was the recruiting program among Army of the Republic of Vietnam (ARVN) troops and GVN civilian servants. Destruction of South Vietnam's armed forces was the overriding priority for the VC; violence, armed attacks, assassinations, kidnappings, terrorist acts, and binh van were employed.

The top objective of binh van was to induce unit desertions, preferably accompanied by an act of sabotage. The next highest objective was to induce individual military desertion or civilian defection, preferably accompanied by an act of destruction or a theft of key documents. Next was to induce major and significant opposition within the military or civil service, either covertly or overtly.

Binh van PSYOP techniques included the following:

- 1. enunciation and constant restatement by all possible means of a liberal VC policy toward recanting military and civil servants, including prisoners;**

2. wide and intensive use of terror and psychological intimidation against key officials and military units, including killing every person;

3. use of penetration agents to infiltrate and develop support within the military and civil service;

4. use of family ties and friendships to induce or coerce military personnel and civil servants to desert, defect, or covertly serve the VC;

5. tangible and intangible rewards for those who deserted or defected, (for example, the VC announced it gave \$2,000 to a group of deserters in Long An Province);

6. encouragement among potential draftees to oppose the military draft; and

7. distribution of two songbooks containing 20 songs. The emotional songs were about the homeland and total victory. They contained communist ideas, praised party leadership, and presented the great qualities of the communist guerrillas. Cultural dramas were also used to promote the cause.

US PSYOP objectives in the Vietnam War were ill-fated from the beginning, primarily because of the "foreign invader" image of the United States. US psychological operations were used simultaneously as a means of achieving US foreign policy goals and as a substitute communications tool for the Republic of Vietnam to create nationalism. We misjudged the will of the communists to prolong the revolution and bring about reunification. We also misjudged Vietnamese reluctance to support any central government. In addition, we could not win the support of the US Congress to fight the type of war that needed to be fought. Instead, we fought a protracted war that was doomed. We lost the hearts and minds of the Vietnamese and our fellow Americans; we lost them to the PSYOP of the Vietnamese communists. *We must learn the values of strategic, operational, and tactical PSYOP from this devastating experience.*

The Iraqi Propaganda Network

**MSgt Richard A. Blair, USAFR
Col Frank L. Goldstein, USAF**

During the Persian Gulf War, Iraq had considerable success in mounting a psychological warfare (psywar) campaign that reached a wide domestic and foreign audience. While some might attribute this success (at least in part) to overzealous international media providing newsworthy coverage of events in the Gulf, the bulk of the accomplishment is a credit to Iraq's skill in creating and using a variety of media outlets as propaganda dissemination mechanisms.

Following his established pattern, which was designed to prevent the accumulation of power within any one governmental entity, Saddam Hussein distributed propaganda duties among many offices within the government and the Baath Party. While most of these offices officially answered to the Ministry of Culture and Information (MCI), they were actually managed through informal channels by the Baath Party, the Revolutionary Command Council (RCC), and Saddam Hussein himself.

Within Iraq, all broadcast facilities are owned and operated by the Broadcasting and Television Organization of the MCI. Prior to the invasion, Iraqi broadcast capabilities included two prime-time television broadcasts, two domestic radio services- "Baghdad Domestic Service" and "Voice of the Masses" (VOM)- and shortwave radio broadcasts of VOM in Kurdish, Turkoman, and Assyrian.

Shortly after the invasion, Iraq took over Kuwait's radio facilities and began operating the Provisional Free Kuwait Government Radio program. They also implemented at least five additional shortwave radio programs designed to undermine the Saudi and Egyptian governments and the morale of Arab troops in the Gulf.¹

Once Allied coalition bombing commenced, the Iraqi broadcasting capability was severely hampered. Iraq's television capability was completely destroyed and the only radio broadcasts noted were "Baghdad Domestic Service" and "Voice of the Masses"-both operating at greatly reduced signal strength.

The printed media within Iraq was also largely controlled by the government. The Baath Party published the largest daily newspaper in the country, *Al-Thawrah*. The MCI managed Al-Jahameer Press House, which published two other widely read dailies in Iraq, the Arabic-language *Al-Jumhuriyah* and the English-language *Baghdad Observer*. The Ministry of Defense also published an Arabic daily newspaper, *Al-Oadisiyah*, and other ministries and agencies of the government sponsored the majority of some 12 weekly papers and monthly magazines published in Iraq. Even where they did not control a publication directly, the government still influenced its contents-the MCI's General Establishment for Press and Printing licensed and censored every publication that appeared in the country.

The Iraqi government also expended considerable resources to reach foreign audiences. Iraqi television aired video clips to foreign broadcast organizations over both ARABSAT and INTELSAT. The Iraqi News Agency (INA) gathered and translated news and commentary from Iraqi press, radio, and television sources and disseminated reports by wire to subscribers around the world. The INA distributed its material even further through its participation in the Non-Aligned News Agency Pool, a service of the Non-Aligned Movement that facilitates the sharing of news items among member nations.

Iraq also controlled several other significant media resources, the most notable of which was the "Voice of the Palestine Liberation Organization," a radio program produced by Palestinian elements in Baghdad and broadcast over the Iraqi shortwave radio network. They had varying degrees of influence over some ideologically compatible media like the Libyan news agency JANA and the Palestine Liberation Organization (PLO) radio in Algiers. By mid-November, Iraq was successful in rallying information officials of Palestine, Tunisia, Jordan, Yemen, Mauritania, and Sudan to issue a joint statement endorsing the Iraqi position and discussing ways of bolstering

media cooperation to confront the intensive hostile media campaign launched by the United States and its allies.

Additionally, Iraq took advantage of every opportunity to provide its views to foreign news agencies through government officials, both at home and abroad. For example, an informal examination of three days' worth of Iraqi propaganda in mid-August revealed official statements made to the press in various countries by three RCC members, seven government ministers, 10 ambassadors, a governor, a military commander, and the speaker of the National Assembly.

Iraq also displayed great success in varying the spokesmen mouthing their propaganda. Sometimes this simply took the form of issuing statements in the name of various groups or individuals; for example, the children and vanguards of Iraq or the American hostage Golden Johnson. More often, it consisted of quoting pro-Iraqi statements elicited from various amenable personalities such as Palestinian leaders George Habash and Nayif Hawatimah or of distorting statements by world leaders whose condemnations of Iraq left room for misinterpretation.

Iraq allowed the first Western journalists into Baghdad on 18 August 1990. Later, however, all foreign journalists except a news team from Cable News Network (CNN) were expelled--and these journalists were always strictly controlled. They were escorted everywhere, and all news reports leaving Iraq were censored by the government. Although most of the world knew that Iraq was censoring these journalists' reports, use of this link to the CNN network still greatly enhanced many of Iraq's propaganda campaign objectives.

Additionally, Iraq used covert methods to access outlets that could not be influenced openly or directly. Stories of widespread Iraqi bribery surfaced continuously throughout the crisis. Supposedly, influential members of various countries were offered valuable gifts and monetary compensation to promote pro-Iraqi sentiment. One confirmed report of this activity resulted in the expulsion of an Iraqi Embassy official in Pakistan for "providing financial assistance for the publication of propaganda materials against the state [of Pakistan]."2

Iraq also financed several newspapers in Western Europe to gain Arab support throughout that region. However, toward

the end of the crisis, several of these newspapers either closed down or reduced operations. It is uncertain whether Iraq gave up this project due to budgetary reasons, lack of discernible positive results, or a combination of both.

Iraq's counterpropaganda efforts completed the network. With some modifications, Iraq took the approach that nearly all hostile themes and attacks should be countered openly and vociferously. Therefore, the Iraqis collected hostile propaganda, analyzed it, developed appropriate themes in response, and inserted them into their own campaigns within hours. For example, within hours of President George H. Bush's address to the US Congress on 11 August 1990, INA carried a lengthy rebuttal and sent it out over the newswire. Shortly thereafter, INA carried a second long rejoinder composed by Foreign Minister Tariq Aziz. By the evening of the 12th, the editors of every Iraqi daily paper had prepared, for publication in the morning papers of the 13th, their own attacks on the speech. To complete the cycle, INA then compiled a summary of the newspapers' criticisms that was circulated on the newswires early on the 13th.

In analyzing Iraq's success in disseminating propaganda to foreign and domestic audiences, three key components are easily identifiable. First, Iraq's invasion of Kuwait grabbed world interest and focused international media. Second, the government's skillful use of modern technology in mass communications provided it with instant access to the world populace. And third, Iraq used aggressive and imaginative propaganda campaigns to obtain and retain the widest possible mass audience.

By combining these three elements, Iraq not only made significant contributions to its national objectives but also created a powerful force multiplier. This multiplier presented the illusion that the Iraqi military capabilities and will to fight were much stronger than reality proved them to be.

Iraq's achievements in coordinating their internal and external propaganda efforts resulted in significant success in reaching world audiences. Although ultimately unsuccessful, the Iraqi effort clearly demonstrates that imaginative use and integration of today's mass communications technology allows any country to influence audiences well beyond their borders.

Notes

1. These five shortwave radio programs were "Holy Mecca Radio," first observed on 10 August 1990; "Voice of the Egypt of Arabism," first observed on 11 August 1990; "Voice of the Peninsula and the Arabian Gulf," implemented on 29 August 1990; "Voice of Peace," implemented on 11 September 1990; and "Voice of Arab Awakening," first observed on 13 October 1990.
2. Pakistani newspaper *Markaz*, 16 January 1991.

Psychological Operations in Panama During Operations *Just Cause* and *Promote Liberty*

Col Dennis P. Walko, USA

US military psychological operations units figured prominently in 013eration *Just Cause* in Panama. Even US television viewers gained some appreciation of PSYOP; they saw broadcasts from the former Panama Defense Force-dominated national television channel that included "mysterious" US and Panamanian nation symbols. They saw safe conduct passes dropped on Panama Defense Force and "Dignity Battalion" (DIGBAT) positions, and they heard tactical loudspeakers appealing to enemy forces to cease resistance and surrender. Perhaps our country's last television view of PSYOP activity in Panama was that of the loudspeaker in front of the Papal Nunciature blaring heavy metal rock music to "drive Noriega out of his mind" or "keep him awake."

Military PSYOP disappeared from US public view immediately after Noriega surrendered to US authorities, only to reemerge during Operations *Desert Shield* and *Desert Storm*. Americans once again were exposed to news articles featuring PSYOP leaflets and loudspeakers.

In each case, the attitude of our mass media and the ensuing public response were favorable to PSYOP. Articles in newspapers and journals portrayed PSYOP as both cost effective and critical to success. Official and unofficial US military circles said PSYOP was a valuable force multiplier that had induced enemy forces to abandon their positions or surrender, thereby reducing loss of life on both sides.

Less conspicuous was the bulk of psychological operations during *Just Cause*. Most PSYOP activities and accomplishments in Panama were hardly noticed by either the US public

or the general military community. The special operations community, however, did notice. The lessons learned in Panama were incorporated into standing operating procedures. Where possible, immediate changes were made to capitalize on the PSYOP successes of *Just Cause* and *Promote Liberty*. This led to improved production, performance, and effect in the next contingency, which took place within six months after the return of the last PSYOP elements from Panama. Operations *Desert Shield* and *Desert Storm* employed PSYOP at an order of magnitude and effectiveness that many credit to the lessons learned from Panama.

Recognizing that much of *Just Cause* and its complementary civil-military restoration operation, *Promote Liberty* is still classified, this article has been prepared to informally discuss PSYOP during the Panama contingency. It will briefly cover the evolution of PSYOP plans and operations, describe their objectives, and show how PSYOP were successfully executed. Hopefully, this piece will show there was a lot more to PSYOP during this contingency than rock music and surrender appeals, and that PSYOP did, in fact, contribute significantly to the overall success of the operation.

Panama contingency plans had been under development for years prior to *Just Cause*. These contingencies were to range from evacuation of US and third country nationals to full-scale combat operations against Noriega, his Panama Defense Forces (PDF), and (later) the DIGBAT goon squads. The latter targets were increasingly viewed as threats, not only to Panamanians, but also to US dependents. Contingency planning culminated with consolidation and reconstruction operations to follow any combat scenario.

Psychological operations were well integrated into the planning process. The worst-case scenario involved combat operations in Panama. For this option, planners recognized the importance of promoting prompt cessation of hostilities and minimizing civilian casualties. The following were key concerns for this option:

- US casualties
- Panamanian civilian casualties
- Collateral damage

- Delay in US troop withdrawal
- Disinformation and hostile propaganda

The five concerns were interrelated. If the PDF offered concerted resistance to US troops, casualties on both sides would escalate, civilians would likely suffer, Panama City and US military installations might sustain severe property damage, and US troops could become bogged down in an effort which would increasingly be susceptible to counterproductive local, US, and worldwide criticism. Related to all this was the concern that the Noriega-controlled Panamanian media—essentially a propaganda machine—would continue to broadcast material detrimental to US interests and stir up doubts as to the effectiveness of our operations.

Additional concerns for consolidation or reconstruction operations included repairing the government and economic infrastructure and establishing a functioning democracy. Specific PSYOP missions and requirements were identified to support contingency plans and address all the aforementioned concerns.

On the tactical level, loudspeaker teams were scheduled to accompany all major ground combat units. Their objective was to convince the enemy to cease resistance and surrender while advising innocent civilians how to stay out of harm's way. As the plan matured over time, loudspeaker teams received increased emphasis: a few months prior to the operation, the designated commander for Joint Task Force-South (CJTF-South), then Lieutenant General Stiner, directed that loudspeaker teams be provided to each infantry battalion (Army and Marine Corps) and each SEAL battalion-equivalent participating in the assault phase of the operation. This was probably the highest loudspeaker-to-combat force ratio in the history of the US military.

On the national-strategic level, a PSYOP task force would be formed, based upon the regionally oriented 1st PSYOP Battalion (Bn) augmented with additional loudspeaker, radio, and television assets from the 4th PSYOP Group (Gp). The PSYOP task force (TF) main body was to deploy early, assume control of ongoing tactical PSYOP, and provide general PSYOP support to the operation, employing full media production and

dissemination capabilities. Its objectives were to conduct national-level PSYOP designed to minimize interference and resistance, and to foster support for US military operations and efforts by the Panamanian government to restore law and order.

Various prepackaged PSYOP materials-prerecorded TV, radio, and loudspeaker tapes; radio and loudspeaker scripts; music; and designs for printed leaflets and posters-were developed from 1987 to 1989. These were approved by an interagency committee headed by the commander of US Army South.

The commander of the 1st PSYOP Battalion, 4th PSYOP Group, based at Fort Bragg, North Carolina, was the designated commander of the PSYOP TF in the eventuality of any Panama contingency. He was responsible for developing detailed contingency PSYOP plans, annexes, and products, and for coordinating all PSYOP-relevant details with USSOUTHCOM and XVIII Airborne Corps. Prior to the actual operation, often during routing trips to Panama, the commander and other members of his command visited many of the principal target locations and identified potential production facilities-a precaution against a late arrival of PSYOP production equipment.

Facilitating this planning process was the fact that successive 1st PSYOP Bn commanders served as CINCSOUTH's senior theater PSYOP officer, knew most key players on the USSOUTHCOM and USARSO staffs, and had a small liaison cell located in the USSOUTHCOM J-3 directorate. Furthermore, once the XVIII Airborne Corps commander (General Stiner) was designated CJTF for the contingency, coordination between the battalion and that headquarters (including one-on-one meetings with General Stiner) became a frequent affair. General Stiner would later assume overall responsibility for planning and commanding the operation. He took a personal interest in PSYOP, further enhancing their planning, coordination, and execution.

By March and April 1988, Noriega had increased provocative actions against US forces in Panama, having sent harassment patrols into the US-controlled Arraijan tank farm (fuel storage and distribution depot adjacent to Howard Air Force Base) and the nearby US Army ammunition storage facility. At this point,

the National Command Authority ordered additional security forces deployed to Panama, with additional deployments in May 1989. Included among these forces were an additional infantry brigade, military police, and three PSYOP loudspeaker teams. These forces remained in Panama until hostilities were initiated.

The three loudspeaker teams deployed as a tactical detachment with sufficient personnel, vehicles, radios, and speaker systems to permit reconfiguration as five teams if the need were to arise. As time dragged on, soldiers and equipment were rotated to and from Panama to such a degree that virtually every battalion in the 4th PSYOP Gp had an opportunity to deploy soldiers to Panama. This would prove extremely important: by the time of the contingency, a large number of PSYOP soldiers had firsthand knowledge of the area, the equipment, the supported commanders already in Panama, and the Spanish language.

As tension in Panama grew, loudspeaker personnel became integral members of US tactical exercise and security forces. These units often became embroiled in PDF and DIGBAT-orchestrated protests during several of the increasingly frequent exercises conducted by US forces to reassert US treaty rights. The loudspeaker teams not only effectively employed prerecorded tapes which would also be useful later, during the contingency; they prepared other announcements on the spot. These encounters served as valuable training and experience for PSYOP soldiers who would support *Just Cause* and *Promote Liberty*.

Two events in Panama were to have a significant effect upon PSYOP planning for the contingency. The first was Noriega's nullification of the May 1989 Panama presidential elections. Besides the obvious worsening of Panama's internal conditions and international relations, this act gave US PSYOP a number of obvious themes for use against Noriega and his "inner circle." It also heightened the probability of a combat contingency and energized even greater attention to the contingency planning process (including PSYOP planning and preparation). From this point forward, both the 1st PSYOP Bn commander and the 4th PSYOP Gp commander spent increasing time in Panama, providing PSYOP planning expertise to

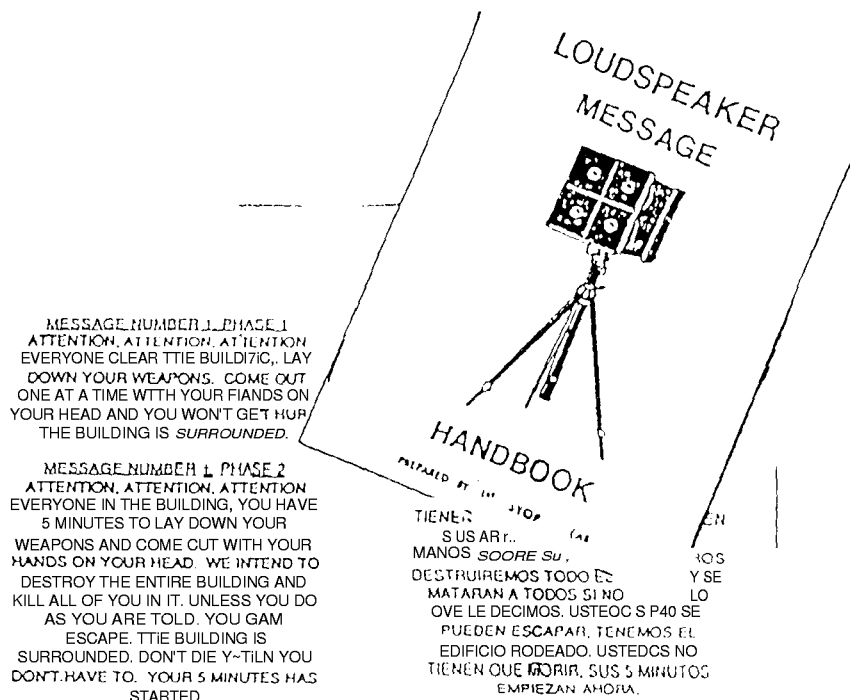

CINCSOUTH, his staff, and the US Country Team. (In fact, both officers were to return from lengthy TDY in Panama within 72 hours of the events that precipitated Operation Just Cause.)

The second event was the failed 3 October 1989 coup attempt by members of the PDF against Noriega. After the coup attempt, Noriega rapidly purged the PDF of its more moderate leaders and boosted training for the paramilitary DIGBATs. Prior to this coup attempt, the US combat contingency plan had focused on removing Noriega and his cronies from power while leaving the PDF institution alone; under these new conditions, it became increasingly clear that, in the eventuality of a contingency operation, the JTF would not be able to operate within those limited US objectives. Therefore, PSYOP materials that had been prepared prior to the coup required revision. The most time-consuming revisions were those associated with audiovisual products that had been prepared for possible broadcast over television.

As time passed and the situation in Panama worsened, it became clear to the 1st PSYOP Bn commander that he could no longer keep television and radio broadcast tapes up to date. To have done so would have worn out personnel of both the battalion and the 4th PSYOP Gp's Strategic Dissemination Company. Since these products were classified TOP SECRET-SPECAT, they could only be produced at night and on holidays when noncleared soldiers were off duty and away from the media production facility. Furthermore, this activity was beginning to tie up personnel who were key to other ongoing PSYOP activities in the USSOUTHCOM area of operations. Thereafter, for initial operations the PSYOP TF would depend upon the battalion's prerecorded music tracks, silent footage and logs, and written scripts that could be modified at the last minute and read "live" by PSYOP broadcast announcers. In fact, such modifications for radio and television broadcasts were made by the commander, from Panama, over long-distance telephone within hours prior to commencement of hostilities. All were used during the first 24 hours of Just Cause, constituting the first official US broadcasts in Spanish heard by the Panamanian population.

After General Thurman's assumption of command on 30 September 1989, the failed coup attempt that shortly followed, and General Stiner's designation as CJTF-South, conditions in Panama continued to deteriorate. US concerns for the safety and protection of US lives and property were heightened; preparation and coordination for a Panama contingency involving full-scale combat operations were intensified.

As a result, 4th PSYOP Gp loudspeaker personnel at Fort Bragg were placed on recall status for possible deployment on short notice. Loudspeaker system shortfalls were identified and additional systems were obtained from Army Reserve PSYOP units. Loudspeaker broadcast scripts in English and

Source: 1st PSYOP Battalion, US Army

Figure 1. These bilingual booklets were carried by tactical PSYOP loudspeaker teams, along with prerecorded tapes of the same messages in Spanish. Note the messages in the extract; US troops did not mince words.

Spanish were refined by the 1 st PSYOP Bn and published in a small handbook. Prerecorded tapes for loudspeaker broadcast were revised and additional announcements were recorded. Tapes and booklets were taken to Panama for use by the deployed teams if the time came to execute the contingency.

The 1st PSYOP Bn commander was designated by General Stiner as a member of a 20-man JTF-South staff element identified to predeploy to Panama in advance of the assault forces if the contingency were to be executed. As it turned out, this predeployment would prove important to the success of PSYOP in the Panama contingency. With the exception of the three loudspeaker teams already in Panama and the loudspeaker teams accompanying the airborne and special operations assault forces, the PSYOP TF would not arrive in Panama until after initial assault operations.

The commander, his forward liaison cell, the loudspeaker detachment, a prepositioned 4th Gp AM radio broadcast team, Volant Solo PSYOP TV/radio broadcast aircraft from the 193d Special Operations Group (SOG) of the Pennsylvania ANG, and the USSOUTHCOM J-3 PSYOP office would comprise the PSYOP planning, coordination, development and dissemination capability in Panama until D + 3. Late arrival of the main body notwithstanding, PSYOP employed a full range of media and other activities in support of initial combat operations-and with good effect.

During the early morning of 18 December 1989, two days after the fatal shooting of a US serviceman and the harassment of another and his wife by members of the PDF, the 20-man advance JTF-South staff element administratively and clandestinely deployed to Panama. The 1st PSYOP Bn commander assumed control of his forward elements in accordance with prior arrangements with USSOUTHCOM headquarters, although the members themselves still had not been informed of the pending operation, and in fact were not to be told until the night of the assault.

At 1900 hours, 19 December, the 1 st PSYOP Bn commander assembled the members of his liaison element, the loudspeaker detachment commander (now the company commander who, coincidentally, was in Panama conducting his assumption of command property inventory), and the commander of the

prepositioned AM radio broadcast team to notify them that **Just Cause** was to be executed on 20 December. The commander then organized the element to function on a 24-hour basis as his ministaff, interim PSYOP development cell, and radio broadcast team. Consistent with the JTF OPLAN, the loudspeaker detachment would break down into five teams which would link up with their designated supported units. The other loudspeaker teams and PSYOP liaison officers that were called for in the plan would deploy with their supported combat units and would operate in an attached or OPCON status-a command and control relationship which caused problems, as will be discussed later.

This sri jall PSYOP force was prepared to work in shifts until the PSYOP TF arrived. Although envisioned to function only for about the first 24 hours of the operation, it was this small group which planned, coordinated, and ran psychological operations for the first three days of the contingency. Once the remainder of the PSYOP TF had commenced operations, the liaison element continued as the JTF PSYOP staff section and PSYOP TF liaison at the JTF-South headquarters, maintaining continuous coordination with all elements of the JTF and coordinating aviation requests and leaflet drops.

In addition to AM radio broadcasts, initial PSYOP activities involved TV broadcasts of prepackaged materials from the 193d SOG's Volant Solo aircraft. The recently revised scripts were read live by PSYOP soldiers who had been picked up at Pope AFB, North Carolina, while the aircraft was en route to Panama. These broadcasts-all in Spanish-notified the Panamanian population of US intent and advised how to avoid accidentally becoming a casualty. (These were the "mysterious" broadcasts that puzzled some of the US media in Panama.)

The TV channel used for broadcasts by Volant Solo was Channel 2, the national channel commandeered by the Panamanian military shortly after the 1968 coup d'etat and controlled by the military until 20 December 1989. It was targeted for psychological impact, to deprive Noriega of his principal TV media, and to ensure prompt reception by the populace. To this end, and according to the OPLAN, Channel 2's broadcast capability was neutralized by special operations forces at approximately H-hour, and Volant Solo began

broadcasting on the frequency. The broadcast facility was shut down in such a manner as to enable prompt restoration of capabilities once the US and new Panamanian government were in full control of the situation.

The PSYOP element commenced activities by making use of the same previously prepared scripts and recordings being broadcast via Volant Solo. Soon it was heavily involved in preparing scripts and acquiring news items and music adequate to keep the Panama City area receiving Volant Solo's broadcasts and the nationwide audience receiving the AM radio station's broadcasts 24 hours per day. This was a major undertaking: Scripts would have to be developed, coordinated with the staff, and translated into acceptable Spanish so the Panamanian population would listen and understand. All of the PSYOP soldiers were actively engaged in this process. Fortunately, all were bilingual and thoroughly familiar with the situation in Panama. Tapes of popular music were available to maintain audience attention between announcements.

Safe conduct passes were prepared at and distributed by the printing facilities at the main US military print plant at Corozal. (Later versions, as well as other products, were printed on presses deployed with the PSYOP TF and on captured presses at Noriega's former PSYOP facility on Fort Amador.) It should be noted that Gen Marc A. Cisneros, CG USARSO, signed the leaflet, as opposed to CINCSOUTH (General Thurman), or CJTF-South (General Stiner). General Cisneros had already established a good reputation among the Panamanian population and the PDF, and therefore was expected to have greater credibility as a known entity. As events proved, his reputation would be a valuable commodity, not only as endorser on subsequent surrender appeals, but in personally arranging the surrender of regional PDF garrisons by telephone.

These first safe conduct passes were printed on newsprint. Three hundred thousand of them could be printed and chopped into bundles rapidly in a form that could be handled by two of the cell's PSYOP sergeants with a pickup truck. Furthermore, US helicopter crews could easily take on 30,000 or more leaflets and toss them over target areas without difficulty due to their compactness and small size. If the

Figure 2. Three hundred thousand of these safe conduct passes were printed on newsprint as an expedient. They were printed in Spanish on one side but in English on the other so that US troops understood what was being promised. These were proven effective in the early stages of Just Cause, especially when accompanied by loudspeaker broadcasts.

contingency had taken place during the rainy season, this approach might not have worked very well since the newsprint would have rapidly disintegrated on contact with water. Had heavier paper stock been used, however, the leaflets would have taken longer to print and might have been too bulky and heavy for the small detachment to handle.

These safe conduct passes were dropped by helicopter on targets of opportunity and on locations identified by PSYOP soldiers. Helicopter pilots often carried bundles of leaflets just in case an opportunity would present itself for their use. Later versions of these passes were also distributed as handouts from loudspeaker teams and other US forces.

One of the earliest indicators of effectiveness was the successful employment of loudspeakers and leaflets in support of US Marines at La Chorrera, a small village on the outskirts of Panama City and Howard AFB. The Marines had encountered heavy resistance from PDF and DIGBAT members for the first 24 hours. The Marines ceased fire for the night. Surrender appeals were then blared over loudspeakers as safe passage leaflets were dropped. Resistance ceased early the next morning without an additional shot being fired. Surrendering personnel came forward clenching the safe conduct passes.

Colocated with the PSYOP cell was the commander of the Joint Audiovisual Detachment (JAVDET), a unit comprised of multiservice elements from the Joint Combat Camera Center. Although not in command of the JAVDET, the PSYOP TF commander could request specific video coverage by the detachment. He then had a significant amount of footage already available when the main body of the PSYOP TF arrived with organic camera teams and audiovisual production capability. One copy of every cassette produced by the JAVDET was delivered to the PSYOP TF.

The JAVDET's transportation assets were extremely limited, but the PSYOP TF commander was able to match up these cameramen with several of the vehicle-mounted loudspeaker teams already in-country. It was largely the videos obtained by these photographers that were used in initial PSYOP audiovisual operations. Also, since these videos were not PSYOP products, they were provided by the JAVDET to the US media through program action officer (PAO) channels. PSYOP loudspeaker soldiers and activities therefore wound up receiving higher visibility in the US media than would have been the case otherwise.

Immediately upon activation of the 10,000-watt AM PSYOP radio station and commencement of the initial assaults on 20 December, the new president of Panama, Guillermo Endara, communicated with the Panamanian masses principally via this station. Among Endara's first announcements was the promise that anyone turning a weapon in to US forces would be paid \$150 for it.

The "money for guns" concept had been envisioned as a viable PSYOP technique to promote cessation of hostilities. Results during *Urgent Fyiry* in Grenada had been successful, even though undertaken late in the operation. In the case of Panama, the initiative was taken early; it paid off. The PSYOP radio station explained and promoted turn-in procedures to combatants and to the Panamanian population. The newly arrived PSYOP TF commenced preparation of numerous printed leaflets and posters to convey information leading not only to the rapid surrender of PDF and DIGBAT personnel, but to their turning in individuals and cached weapons as well.

Early in the operation, PSYOP soldiers supported civil military operations, including the displaced persons (DP) camp hastily established in Balboa Village. A tactical PSYOP loud-speaker team set up full-time operations in the compound and amplified PSYOP radio broadcasts over the loudspeaker system to put the people at ease and keep them informed. This team, along with other PSYOP soldiers, moved throughout the camp, handing out newspapers prepared by the PSYOP TF, pretesting proposed PSYOP products, chatting with the people, observing their actions, and reporting potential problems to the camp administrators-members of the 96th Civil Affairs Battalion.

A primary problem associated with the DP activity was rumor control. By building rapport and establishing information programs with the DPs over time, PSYOP soldiers established their credibility and were able to neutralize rumors before they expanded to crisis proportion. When an improved, expanded DP facility was completed at the Panamanian-controlled portion of Albrook Field, PSYOP soldiers helped prepare the population of the Balboa camp to minimize apprehension about the move to the new site and to enhance control during the move itself.

The tempo of PSYOP increased dramatically as time progressed and the PSYOP TF became fully operational. Additionally, the 4th PSYOP Gp commander arrived as senior PSYOP commander in-theater-serving as special PSYOP advisor and expeditor for General Thurman. The group commander used the full range of media to convey public information while soliciting cooperation and support from the

military in identifying and apprehending PDF and DIGBAT members and arms caches.

Posters, leaflets, radio broadcasts, and television announcements solicited information and provided telephone numbers to be called by those wishing to volunteer information regarding weapons or PDF and DIGBAT fugitives. These techniques were effective. Within minutes after dissemination of printed material or broadcast of the information, the designated telephones began to ring and information poured in. It was also found that new posters, especially "wanted" posters bearing photographs of PDF and DIGBAT fugitives, had to be printed and distributed continuously because people removed them from walls to avoid identification, to keep as souvenirs, or possibly take them home for study and future reference.

Other products focused on establishing a favorable image of US forces, explaining US motives, and providing information needed to reestablish the normal routine. Products of the latter category were in demand because the former PDF-dominated Panamanian media was essentially shut down. In fact, the newspapers printed by the PSYOP TF were so sought after by the public that enterprising Panamanians grabbed bundles of them and sold them to passers-by.

At this point, it should be stressed that all products were tested prior to dissemination. Product review and approval was extended to the level of the executive office of the Panamanian government in order to reduce the probability of error. (A classic example of such an error on the part of an enemy occurred during *Desert Shield/Storm* when an Iraqi propaganda announcer warned US military personnel that their wives were fooling around with movie stars such as Bart Simpson!)

A short case study is presented here for the purposes of clearly demonstrating the complexity of PSYOP product development during *Just Cause* and, later, *Promote Liberty*. During the operation, the PSYOP TF developed a product bearing the multicolored image of the Panama national seal. The insignia was surmounted by an eagle. Due to the poster's size and complexity (five colors), the prototype was assembled and sent to the Corozal print plant. The workers at the plant

Figure 6. "Wanted" handbill

267

remembered that they had produced similar images before the contingency and still had the master plates; they therefore used these plates. The resulting product was indeed beautifully done. Only one problem: the PSYOP TF S-3 realized that, instead of the traditional eagle atop the Panama crest, there was a North American bald eagle-not exactly the kind of thing that would make us popular!

When redone, the revised poster with correct eagle and crest, was tested again "just to be sure." Again, a problem surfaced-according to the National Code of Panama, the crest was supposed to appear in a field of green, and the proposed poster would have done just that. Unfortunately, the proposed green was the color of one party of the Panama coalition government-one which was becoming increasingly viewed by Panama political opponents as trying to muscle out the other two coalition parties.

The poster finally came out with the eagle and crest on a neutral background. The lesson here is that pretesting and posttesting, including the actual colors to be used, are fundamental to the PSYOP development and production process.

Source: 1 st PSYOP Battalion, US Army

Figure 8. This small red, white, and blue poster was printed on heavy stock paper and was distributed throughout Just *Cause* and Promote *Liberty*. It was displayed on military vehicles and handed out by US troops. Its objectives were to portray US-Panamanian teamwork and to reduce perceptions of US forces as military invaders or occupiers. Within days after dissemination commenced, Panamanian commercial vendors were peddling T-shirts and other paraphernalia bearing the same logo.

This process is crucial-and testing needs to be done right. Additionally, all PSYOP campaigns and products require extensive staff coordination and personal review by the PSYOP TF commander.

As the situation further stabilized, it became increasingly important to get the commercial media "back in business." Shortly after the first day of operations, the PSYOP TF commander began to receive personal telephone calls from media representatives willing to get their TV and radio stations back on the air in support of the US and the new government-but only if they and their personnel would be escorted by US soldiers or transported under guard while their facilities were guarded by troops of the JTF. There existed considerable concern for possible terrorist acts by DIGBAT goons still at large, including possible murder or sabotage.

Initially, soldiers and vehicles could not be spared by either the PSYOP TF or JTF-South to satisfy all commercial media's conditions. Nor did the PSYOP TF have the weapons necessary to provide appropriate security. However, at about 2 100 hours the night after Noriega obtained sanctuary in the Papal Nunciature, a team of PSYOP soldiers entered the TV Channel 2 broadcast facility and began broadcasting prerecorded tapes of cartoons from the station library. By morning, most of the commercial broadcasting crew had arrived, along with a large crowd of Panamanians enthusiastically waving Panamanian and US flags. They were celebrating the arrival of US troops and the "grand reopening" of their singing channel.

The commercial crews volunteered to restore operations as the PSYOP team temporarily observed and screened their material to ensure that it was not counterproductive to US aims or those of the new government. Another TV channel (4) was similarly reactivated the same day.

Most of the principal radio and television stations in and around Panama City were back on the air within days, temporarily under observation by or supervision of either US PSYOP personnel or Panamanian officials with whom PSYOP had established a working relationship. These media not only broadcast materials prepared by the PSYOP TF, but also prepared and broadcast excellent programs on their own. Their

programs supported US military forces and the government of Panama.

By 8 January, the PSYOP TF had produced and disseminated over one million leaflets and handbills, 50,000 posters, 550,000 newspapers, and 125,000 units of miscellaneous other printed materials. Volant Solo had conducted TV broadcasts for the first several days, the PSYOP AM radio station had been operating 24 hours a day, and countless messages had been aired on commercial radio and television stations and published in commercial newspapers. Loudspeaker teams continued to support tactical units by broadcasting advisories, interacting with the population, and providing timely PSYOP advice to US commanders.

Psychological operations figured prominently in the successful US efforts to flush Noriega out of the Papal Nunciature, where he had sought refuge. They played a significant role in establishing the Panama Public Force-the new police force designed to replace the old PDF. PSYOP teams circulated through Panama City and other population areas, assessing conditions and public attitudes, interacting directly with the public and with US combat and security forces, and resolving difficulties when they arose.

All of the first series of US PSYOP objectives were accomplished during *Just Cause*. US combat elements began to depart in early January 1990. Focus shifted to the consolidation of the new government in Panama and the restoration of the public information infrastructure. The PSYOP TF was stood down, replaced by a PSYOP support element comprised of 48 personnel.

This element, consisting of stay-behind PSYOP soldiers from *Just Cause* and a civilian analyst from the 1st PSYOP Bn, provided PSYOP support to the newly created Military Support Group. This unit then provided US military support to the government of Panama during the nation assistance and civil-military operations of *Promote Liberty*. From mid-January to the end of February, the PSYOP support element produced and disseminated more products and planned and executed more activities than all those in support of *Just Cause* combat operations.

Figure 9. One of many later versions, this poster not only indicates procedures for surrendering arms but also identifies turn-in locations and their hours of operation. Subsequent versions left some of the data blank so that Special Forces soldiers in the countryside could fill in the information and administer similar programs.

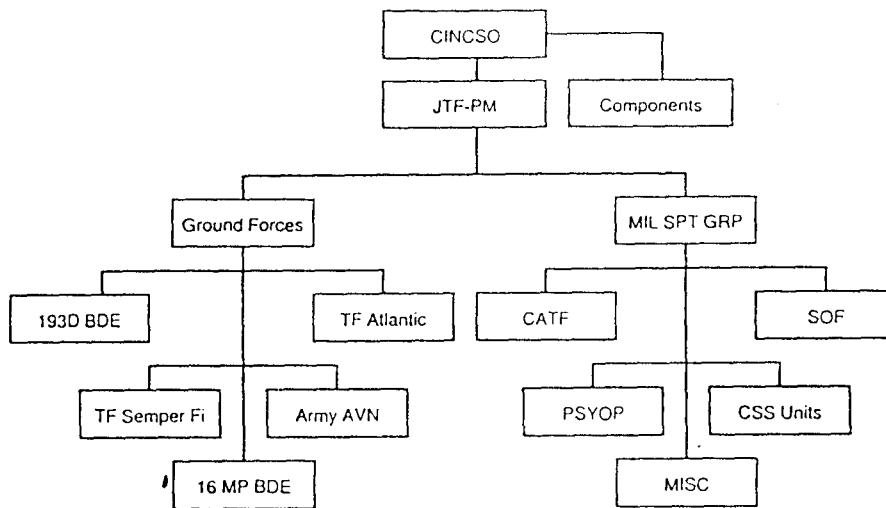

The highly efficient and productive mini-task force increasingly worked in conjunction with the new government, the commercial media, the US Embassy, the Military Support Group, and JTF-Panama to create conditions favorable for restoring democracy, the economy, and public security. Major emphasis was placed on these objectives:

- **Maintaining support for US objectives in Panama.**
- **Professionalizing the newly formed Panama Public Force and Panamanian Police Force (PNP)-constituted principally by former members of the PDF.**
- **Gaining public support for the Public Force and PNP.**
- **Enhancing the effectiveness and prestige of the new government.**
- **Neutralizing disinformation and hostile propaganda directed against the government, the Public Force/PNP, and the US.**

By the end of February, these PSYOP soldiers had been redeployed to Fort Bragg. They were replaced by 8th PSYOP Bn soldiers augmented by linguists and area experts from the 1st PSYOP Bn and by camera and audiovisual technician teams from the 4th PSYOP Gp's Strategic Dissemination Company. This group continued operations, employing the full range of dissemination media, until stood down in May 1991. The final PSYOP objectives envisioned for Panama contingency operations had been accomplished.

From beginning to end, PSYOP supported all stated US military and political objectives. During the initial stages of the assault, PSYOP loudspeakers, leaflets, TV and radio announcements successfully appealed for cessation of hostilities; surrender of weapons and members of the PDF and Dignity Battalions; and compliance with measures promulgated by the newly formed Panamanian government. Psychological operations enhanced credibility of US military forces, assisted in gaining and retaining popular support for US actions, and helped reduce the potential for damaging disinformation and hostile propaganda.

As the operation progressed, psychological operations and PSYOP forces were fully integrated into consolidation operations and emergency relief activities while fostering an

Figure 10. The PSYOP support element coordinated directly with JTF-PM, ground forces, other elements within the MSG, the Panamanian government, and the US Embassy.

atmosphere of return to normalcy. Announcements via US military PSYOP and commercial news media supported this process. Through programs and information developed or disseminated by PSYOP soldiers, 193d SOG Volant Solo technicians, and host-nation affiliates, Panamanians knew when and where to go to satisfy their fundamental needs. Through this process, PSYOP supported not only the theme of legitimacy of the US operation, but also the legitimacy of the newly formed government of Panama.

During the final phase of military operations, US PSYOP supported an orderly return of control to the host-nation government, addressed major sanitation and health threats, and continued military information programs. All of this facilitated prompt return of the deployed US military personnel to CONUS.

Finally, as a natural consequence of these accomplishments, psychological operations and PSYOP units gained recognition among many important US commanders of combat and combat support units participating in the operation. Not only did PSYOP affect them personally by assisting in the reduction of casualties

and damage on both sides, but also assisting in presenting the most favorable image of their commands to the Panamanian population and to the world.

Many of these accomplishments cannot be measured in quantifiable terms. However, there were obvious indicators of success:

- surrender of enemy forces after exposure to loudspeakers and leaflets;
- immediate public response to posters, loudspeakers, and TV/radio announcements, resulting in valuable information and intelligence;
- civilian compliance with instructions conveyed via PSYOP media;
- virtual absence of hostile propaganda and disinformation which could have obstructed the mission; and
- prompt restoration of commercial information services, which contributed to the legitimacy of the new democratic government.

Many valuable lessons were learned by the PSYOP community itself:

- The PSYOP TF commander simultaneously serving as JTF PSYOP officer, theater PSYOP officer, and PSYOP TF commander enhanced initial planning and coordination. As the operation progressed, however, these duties overextended the capabilities of the commander to the extent that he encountered difficulty supervising and controlling the many disparate and geographically separated PSYOP elements and operations.
- The requirement that PSYOP TF simultaneously provide JTF staff support, control tactical assets, and develop and disseminate PSYOP products stressed the capabilities of the task force to the breaking point. The battalion staff and company configurations did not easily adjust to the requirements of a task force much larger and more complex than experienced before. Of particular concern was an inability to control the tactical PSYOP teams, which were vital to successful PSYOP campaign planning and evaluation. Attaching these teams OPCON to combat commanders while optimizing on-site responsiveness during the assault phase detracted from

overall PSYOP TF performance during consolidation activities. These teams should have reverted to a direct support status under operational command of the PSYOP TF as soon as that force had the ability to fully exercise that function. Unfortunately, that capability did not materialize until the majority of the teams had returned to the US.

- Augmentation from other battalions of the 4th PSYOP Gp was essential to the success of the PSYOP TF. However, due to the peacetime configuration and functioning of the group, which only occasionally involved an integration of effort across battalion lines, the full talents and capabilities of soldiers and equipment were extremely difficult to exploit in Panama.

- The L-Peries modified table of organization and equipment (MTOE) for the 4th PSYOP Gp and its subordinate units was not optimally suited to requirements of the contingency.

Some of the "good things" that were either learned or reinforced are listed below.

- Early integration of PSYOP into the contingency planning process helped ensure overall success of the operation.

- Tactical loudspeaker teams contributed to demoralization of the PDF and DIGBATs and to cessation of hostilities and surrender. The teams used prepackaged scripts and recordings, but frequently employed their own ingenuity and linguistic capability "on the spot" to deal with both hostile forces and the civilian population. Tactical commanders of Army forces, Marine Corps forces, and Navy SEAL forces placed considerable importance on these teams.

- The Panama population listened to, and complied with, instructions and advisories from US military PSYOP TV, AM radio, and loudspeaker broadcasts.

- The working relationship that the 4th PSYOP Gp commander and the 1st PSYOP Bn commander enjoyed with the XVIII Airborne Corps commander and stag, and with CINCSOUTH and his staff prior to Just Cause and Promote Liberty, undoubtedly resulted in a degree of understanding and trust which were critical to the success of joint PSYOP throughout the contingency operation.

- Psychological operations soldiers and airmen were well trained, motivated, self-confident, and effective.

Certainly, some of the problems and some of the "success stories" were situation dependent and can never really be formalized. However, in June 1991-less than six months after the Panama contingency was executed and only weeks after return to CONUS by the last 8th PSYOP Bn members of the PSYOP Support Element-the 4th PSYOP Gp was provisionally reorganized. Regionally oriented battalions remained, but the group was now organized according to an operational concept suitable for a wide variety of contingencies.

The reorganized 4th's basic tenets:

- **The 4th PSYOP Gp commander would deploy to the theater headquarters, along with a small headquarters element, to provide PSYbP advice and assistance to the supported theater CINC and act as "expeditor" for PSYOP-related actions. (This happened informally in Panama, when the 4th PSYOP Gp commander performed this function not only for the PSYOP TF but also for the 96th Civil Affairs Bn, the 112th Signal Bn, and the 528th Support Bn-three units which were at that time under the 4th's peacetime command and control. The concept proved so beneficial to both the PSYOP TF and to CINCSOUTH that it was formalized.)**

- **The PSYOP TF would continue to be commanded by the theater PSYOP battalion commander, but with two other PSYOP battalion commanders working for him:**

1. **A tactical commander (the commander of the reconfigured 9th PSYOP Bn) would control all PSYOP loudspeaker teams and other tactical PSYOP assets and ensure support to other tactical elements of the JTF. The 9th PSYOP Bn would train for these support missions worldwide.**

2. **A media production commander (the commander of the new provisional PSYOP Dissemination Bn) would produce all printed products, recordings, and audiovisual products, and would run all radio and television broadcast operations.**

Since the 4th PSYOP Gp would now be provisionally organized to operate the same in peacetime as in war, it was presumed that overall effectiveness of contingency PSYOP would improve.

The opportunity to validate the new concept presented itself sooner than anyone could have expected. Within one month

after the 4th PSYOP Gp's reorganization, Iraqi forces invaded Kuwait. When PSYOP forces deployed to Saudi Arabia, they did so in the configuration described above. It worked, and worked well! It is estimated that 29 million leaflets and many hours of loudspeaker and radio broadcasts During *Desert Shield* and *Desert Storm* resulted in thousands of Iraqi soldiers being influenced by PSYOP to abandon their positions and equipment and to surrender.

One can only speculate on what might have been the results had PSYOP forces not participated in these contingencies, but the indicators of success are pretty clear. In the author's opinion, these successes are a tribute to the PSYOP soldiers, civilians, and airmen-past and present-whose competence, dedication, and ingenuity most certainly saved US and Panamanian lives and contributed to mission success. Their accomplishments have resulted in increased recognition of the value of PSYOP by senior military commanders and their staffs, and by other agencies of the US government. However, this renewed interest and understanding is highly perishable. We still have a long way to go before the potential of strategic, operational, and tactical PSYOP-and the forces which plan and execute these operations-is fully realized.

THIS PAGE INTENTIONALLY LEFT BLANK

Psychological Operations

in Action

Poland's Underground Media

Laurence J. Orzell

Poland offers a fascinating example of nongovernmental psychological operations in action. Drawing upon that country's long tradition of a conspiratorial press, dissidents affiliated with the banned Solidarity trade union and other organizations engaged in the large-scale production of underground newsletters, leaflets, books, and other printed materials designed to influence popular perceptions. The dissidents also utilized electronic media such as radio and cassettes.

Those activities reflected a broad range of antiregime opinion, but their overall purpose was twofold: to supply uncensored information on political, social, and economic issues, and to maintain a spirit of opposition among the populace. While the dissidents would probably have described their efforts as purely informational or journalistic, their activities could accurately be described as peacetime, non-governmental PSYOP. This article places the Polish opposition's PSYOP efforts within their historical context but focuses on the period following the imposition of martial law (December 1981). In particular, the analysis examines the type of underground print materials produced, the means used to prepare and disseminate them, the government's response, the main themes the dissidents sought to propagate, and the opposition's use of electronic media. The article concludes with an assessment of the overall significance of those efforts.

The Polish resistance, whether directed against czarist Russia, Nazi Germany, or native communist rulers, recognized the value of PSYOP. When the Poles revolted against Russia in January 1863, they formed a conspiratorial government that not only conducted urban guerrilla warfare; it also organized an underground press which contained manifestos directed at

Poles, Lithuanians, Byelorussians, and Ukrainians. Although this effort failed, it contributed to the maintenance of armed resistance. The underground media played a much greater role during World War II. The Home Army (*Armia Krajowa*), Poland's chief resistance group, regularly published an *Informational Bulletin* (*Biuletyn Informacyjny*), copies of which circulated from hand to hand and thus indirectly supported diversions and armed opposition to the Nazis. Other groups, ranging from the far right to the extreme left on the political spectrum, also produced leaflets (*ulotki*) and other publications. So extensive was this network that the London-based Polish government-in-exile issued a postage stamp in 1943-itself a form of PSYOP-commemorating the underground press (*prasa podziemna*).

Armed resistance to foreign domination proved impractical following the communist consolidation of power after World War II, but dissident psychological operations eventually came to assume even greater importance. Antiregime intellectuals benefited from their government's reluctance to engage in extensive repression during the 1970s-lest Poland risk losing the economic benefits of detente-and they established a variety of illegal publishing ventures. One group in particular, the Workers' Defense Committee (later renamed the Social Self-defense Committee), distinguished itself through its publications: *Communique* (*Komunikat*), *Information Bulletin* (*Biuletyn Informacyjny*), and *The Worker* (*Robotnik*). Dissidents also set up an Independent Publishing House, better known by its Polish acronym NOWA, which produced numerous literary works and several periodicals. Despite periodic harassment by the authorities, NOWA and similar illegal publishing enterprises prepared materials targeted at laborers, students, farmers, and other social groups. There can be little doubt that these publications, which advocated political pluralism and respect for human rights, helped forge the broad social alliance which led to the formation of Solidarity during July and August 1980.

Both the regime and the workers used PSYOP extensively during the 1980 strikes. For instance, when the authorities distributed leaflets questioning the striker's motives, the workers responded with broadsheets of their own, counseling

resistance in the face of what they termed government disinformation. The government's acceptance of the strikers' "Twenty-one Demands" effectively extended legal recognition to unofficial publishing activities. The subsequent "Gdansk Agreement" obliged the regime "to respect freedom of speech and ... not to suppress independent publications." Solidarity quickly took advantage of this unprecedented concession. The union published its own national organ, *Solidarity Weekly* (*Tygodnik Solidarnosci*), and regional branches followed suit with a plethora of journals and newsletters. The union press both reflected and shaped the popular perception that the government could not be trusted to carry out the Gdansk accord. Not surprisingly, these publications represented one of the principal targets of repression when the authorities declared martial law on 13 December 1981.

Despite internment, arrests, and confiscations, the underground press quickly reappeared and assumed an even greater importance due to the fact of dissatisfaction. Some activists who were placed in internment camps in 1981-82 even managed to produce handwritten newsletters. For instance, internees at a detention camp in Nowy Lupkow prepared several issues of a newsletter entitled *Our Bars* (*Nasza Krata*), named after the prison bars which isolated them from society. Copies of *Our Bars*, reportedly circulated outside the camp, counseled the maintenance of worker-intellectual ties in the face of government repression. The vast majority of underground publications produced during and after martial law emanated from small groups of individuals in larger cities and towns who had avoided capture. The importance of these PSYOP efforts in dissident strategy became clear when Solidarity's underground Provisional Coordinating Committee issued a declaration in 1982, stressing the need to "organize the independent circulation of information" and thereby "expose the propaganda goals of the authorities."

The underground press produced nearly 1,000 different periodicals, approximately 400 of which appeared repeatedly, some on a regular basis. While it is difficult to estimate the total readership, the sheer number of publications suggests that these materials enjoyed wide circulation, primarily in urban areas. During the first four months of martial law, the

underground published 100 different titles. Many of the early editions bore the simple yet historically significant title *Information Bulletin (Biuletyn Informacyjny)* and consisted of one or two pages. As might be expected, the majority of these materials were prepared in Warsaw, Poznan, Wroclaw, Lodz, and Gdansk. Press runs varied from several hundred to over 10,000, depending largely upon available equipment and printing supplies. During the martial law period (December 1981–July 1983), most of these publications emanated from the remnants of these periodicals, including *Mazovian Weekly (Tygodnik Mazowski)*, which was prepared by union activists in Warsaw! but Solidarity cells in factories and other local enterprises also issued short newsletters.

Solidarity activists did not, however, constitute the only source of clandestine periodicals in Poland. The publications of other underground groups assumed somewhat greater prominence after 1985, due at least in part to the increasingly dim prospects for the union's revival. Nearly all of these groups professed loyalty to Solidarity's ideals, but they also expressed a variety of opinions that distinguish them from the Solidarity mainstream. Three of these organizations merit particular attention. One, known as the Committees for Social Defense (*Komitety Obrony Społecznej*), issued a journal called KOS, which was directed primarily toward an intellectual audience. The Fighting Solidarity (*Solidarnosc Walczaca*) group published a paper of the same name, advocating a more confrontational stance than that favored by most Solidarity leaders. The Confederation for an Independent Poland (*Konfederacja Polski Niepodleglej*), a right-of-center group that antedated Solidarity, disseminated its strong critiques of the regime through its journals *Independence (Niepodleglosc)* and *We Don't Want Commies (Nie chcemy komuny)*. Further, publications targeted at specific social groups such as teachers, university students, and medical workers also attained greater prominence.

Several clandestine publishers branched out into the production of full-length books, an effort that gave rise to greater coordination among the underground media. In October 1986, representatives of several underground journals formed a Social Council for Independent Publishers. At the same time, several publishers concentrated on books rather than periodicals

because sales of the latter proved less profitable. Because this might portend a shift from shorter periodicals to longer products, some activists called for renewed emphasis on journals. Much of the debate centered on the role of the Consortium of Independent Publishers, a group founded in 1986, which sought to promote greater cooperation and minimize duplication within the underground media. Defenders of the consortium claimed that periodicals would continue to play a key role. In June 1986, the consortium helped found an Independent Publishers' Insurance Fund to reimburse members whose operations were closed by the authorities.

Leaflets, handbills, and other ephemera were also used by the Polish opposition, but they declined significantly with the decline in large-scale demonstrations. During the martial law period, the underground produced leaflets in connection with local strikes and other public protests. For example, activists printed and distributed a small leaflet announcing the place and time of a pro-Solidarity rally in Warsaw scheduled for May Day 1985. Leaflets were also used to alert the populace of the time and frequency of Radio Solidarity broadcasts. Still other broadsheets were designed to identify and disgrace those who cooperated with the regime during martial law. For instance, one handbill, entitled "List of Collaborators," purported to be a commendation from the government. The citation praised the recipients for their assistance and contained a blank space for insertion of the collaborators names.

Polish underground PSYOP also relied heavily upon the dissemination of nonverbal symbols by means of mock postage stamps and currency. In 1984, for example, the opposition produced a series of stamps portraying dissident leaders such as Jacek Kuron and Adam Michnik. That same year, the Solidarity organization in Krakow issued a stamp in honor of George Orwell. During 1986, dissidents printed a set of stamps commemorating "150 Years of the Underground Press in Poland." In addition, the underground produced forged Polish currency bearing the portrait of Lech Walesa in place of the figures who appeared on genuine banknotes. Dissidents reportedly printed a banknote containing the likeness of Gen Wojciech Jaruzelski and the inscription, "30 Pieces of Silver." Crude forgeries of US currency, designed as novelty items, also

appeared. During 1985, for instance, an oversized counterfeit of a \$100 bill appeared in Poland with Walesa's picture in place of Benjamin Franklin's portrait.

The producers of underground publications faced a variety of obstacles. Dissidents understandably were reluctant to discuss openly the details of production and dissemination techniques. Most individual publishing enterprises were comprised of small numbers of people who strived to keep their identities and the location of their equipment well-concealed. Materials were first produced on typewriters using carbon paper or on mimeograph machines but the opposition increasingly came to rely on offset and silk-screen presses. The printing process was itself dispersed, particular functions being assigned to different locations. According to the production chief, Warsaw's *Tygodnik Mazowsze* needed 37 apartments, 30 of which were used in preparing each issue. Funds to acquire and maintain equipment came from publication sales, but Solidarity sympathizers abroad also collected financial assistance and made it available. The dissemination of underground publications necessarily involved significantly large numbers of people and great risk. Once printed, copies were reportedly sent to a variety of locations, where *kolportery* (literally, "hawkers") collected them for delivery to subscribers. In the case of *Tygodnik Mazowsze*, this led to the creation of a huge distribution network.

The Polish government responded to underground publishing with a curious strategy that blended harassment, repression, propaganda attacks, disinformation, and apparent neglect. The regime attempted to limit underground publications through strictures on the availability of printing supplies. Stationery shops were required to record all purchases of more than 1,000 sheets of paper. Agents of the Security Service (*Sluzba Bezpieczenstwa*) reportedly monitored such purchases and penetrated several underground organizations. From time to time, officials arrested individuals connected with dissident publications. Anyone engaged in such activity could be detained for 48 hours and fined up to 50,000 zlotys-the amount earned by an average Pole in two months. The authorities sometimes confiscated automobiles belonging to distributors, presumably to hamper the latter's ability to

continue their work. In some cases, the Security Service closed printing operations completely.

The regime also conducted a major PSYOP effort of its own to discredit the underground media. This campaign contained a variety of themes, one of which posited that underground publications were tools of the West-especially the United States. For example, the official press frequently claimed that US dollars were sent to the underground to ferment unrest in Poland. Also, infrequent factual errors in the underground media offered opportunities for the regime to attack their credibility. Moreover, government agents periodically engaged in black propaganda. In some instances, portions of genuine publications, were excised and replaced with forged texts. On other occasions, security officials produced forgeries of entire journals. And in still other cases, erroneous or otherwise embarrassing information was covertly supplied to publishers who reproduced it in good faith. For the most part, however, underground publishers discovered and exposed such activities.

Despite governmental attempts to close them down, Poland's underground media remained prodigious by East European standards. True, the sheer extent of underground publishing rendered it difficult for the regime to suppress such activity entirely, even if Polish officials had made a concerted effort to do so. Nevertheless, why they did not adopt even stronger measures raises some interesting questions. It may well be true, as one Western journalist suggested, that the government could not stamp out the underground media without causing uproar at home and making Poland an international outcast. This consideration might have grown even greater after Mikhail Gorbachev assumed power in the USSR. The regime might also have concluded that it could not hope to win genuine popular support and must therefore tolerate the phenomenon. Then, too, government officials might have believed that the underground press allowed dissidents to vent their frustrations in a relatively harmless manner so long as opposition remained largely confined to the realm of theory.

The underground press criticized and challenged the political, social, and economic status quo. During the martial law period, dissident media served primarily to report instances of repression and to encourage resistance among the

populace. For example, they published information on political prisoners, endorsed strikes and demonstrations, and advocated noncooperation with the regime (e.g., election boycotts). When it became apparent that direct confrontation would not bring about the restoration of Solidarity (or other reforms), the underground press as a whole resigned itself to a long-term struggle with the authorities.

Underground publishing reflected a variety of political trends, from right-wing Polish conservatism to liberal democratic socialism. However, nearly all publications shared some common goals. According to a report issued in early 1987 by the Social, Council for Independent Publishers, they strived to propagate undistorted Polish history, Poland's struggles for independence, the postwar rule of communism in Poland, and methods of national resistance. In this way, they hoped to expose "ideological myths" and "propaganda falsehoods of the communists."

In its attempts to achieve these goals, the underground press addressed a wide range of domestic and international issues. Violations of human rights and the absence of genuine democracy in Poland continued to bulk large in its reportage, but it also devoted significant attention to economic affairs in light of the chronic shortages and debt problems that plagued the Poles. It reflected and encouraged debates over the extent to which dissidents might work for reform through participation in legal organizations such as the workers' councils that were set up following the banning of Solidarity.

Significantly, the emergence of the Freedom and Peace Movement (Wolnosc i Pokoj), which encouraged arms reduction and resistance to compulsory service in the Polish People's Army, also received favorable attention from the underground media, as did environmental issues. Particularly noteworthy was the underground media's increased coverage of international questions such as US-Soviet arms negotiations, Gorbachev's apparent efforts at internal reform, and economic developments in China. Despite glasnost and perestroika, however, the underground media generally continued to criticize the Soviets and praise the Americans.

The underground press clearly constituted the principal means for the dissemination of opposition PSYOP, but

dissidents also extended their efforts to the realm of electronic media. Radio broadcasting proved to be highly vulnerable to jamming and to detection by the authorities, but it continued to resurface from time to time. Dissidents with some experience in electronics constructed ersatz transmitters and made brief broadcasts on FM frequencies from the roofs of large buildings. Collectively called Radio Solidarity, such transmissions first appeared on the airwaves during April 1982, after which they were broadcast in several different cities. Program content was necessarily limited, but broadcasts usually addressed such current affairs as price hikes or the significance of historical anniversaries. In some instances, these transmissions successfully overrode television signals in order to convey a brief verbal message or a "still" image of the slogan *Solidarnosc zyje* (Solidarity lives).

Dissident psyopsters also made good use of videocassette recorders (VCR), audiotape recorders, and even microcomputers. Poland contained an estimated 500,000 to 700,000 privately owned VCRs. The NOWA underground publishing enterprise distributed not only Western films but also videocassettes on Polish subjects produced by the Paris-based Videokontakt organization. Domestic productions, such as filmed interviews with Lech Walesa, also circulated widely. Government authorities attempted to suppress this activity—primarily by confiscations at the border—but the trade continued to flourish. The underground also prepared and disseminated a large variety of audiocassettes containing antiregime songs, news commentaries, interviews, and lectures on Polish history. Some of these tapes reportedly were broadcast over factory loudspeaker systems. Finally, several clever computer owners managed to generate antiregime texts or games. According to an acerbic report published in the hard-line military newspaper *Zolnierz Wolnosci* (*Soldier of Freedom*), Western interests inspired some programmers to create programs that promoted anticommunist attitudes.

Despite various crackdowns by the authorities, the underground media remained a part of the Polish sociopolitical scene. Dissidents stood in a centuries-old tradition of conspiratorial information activity, and their eagerness to utilize modern technology rendered it virtually impossible for the

regime to suppress their efforts. As suggested above, the government might have decided to tolerate this situation; nevertheless, the opposition media in Poland provided a real-world example of the success that can be attained through nongovernmental PSYOP.

The Libyan Raid as a Psychological Operation

Col Frank L. Goldstein, USAF

The use and employment of US forces in psychological operations is a basic but little understood part of US doctrine. The use of US forces to achieve national strategic and tactical security objectives is the basis of PSYOP planning. Security objectives include the influencing of friendly, neutral, and/or enemy audiences to behave favorably or unobstructively toward US national security. A psychological operation is any operation that conveys selected information and indicators to foreign individuals and groups and influences emotions, motives, objective reasoning, and ultimately the behavior of the target audience. Such an operation should also induce or reinforce foreign attitudes and behavior that are favorable to US objectives. The target audience is a foreign group that may include hostile military forces but can also be neutral or friendly.

The stated purposes of the US raid on Libya as reported in the press were to emphasize the cost of state-sponsored terrorism, to damage terrorist operations, and to encourage internal insurrection (*New York Times*, 5 May 1986). I view the US Libyan raid as strictly a psychological operation, an operation planned and carried out to achieve a psychological point of view.

An analysis of the Libyan situation prior to the US raid would have revealed the following scenario.

- Was a psychological operation required? The answer would be yes. The United States needed to influence attitudes and behaviors concerning terrorism among enemy, friendly, and neutral audiences, especially with Libya and Muammar Qadhafi.**

- What would be the best psychological operation approach? **The best approach in consideration of prior attempts to influence Qadhafi and others would be a limited tactical air strike.**

- What was the psychological situation? **The psychological situation revealed that many nations, friendly, neutral, and enemy, were not taking seriously the US concern about state-sponsored terrorism. Colonel Qadhafi had revealed himself to have mood swings and to be susceptible to depressive episodes. Intelligence and the media revealed that there was underlying dissatisfaction within the Libyan government with the current policies of Qadhafi. Additionally, the world had just been --objected to a series of terrorist acts and appeared receptive to such a raid.**

- Would an air strike have a strategic psychological effect? **A successful air strike against Libya and Qadhafi could produce the following: (a) notice to all nations that the US would not tolerate state-sponsored terrorism, (b) notice to Qadhafi that his power was not absolute, (c) notice to anti-Qadhafi forces in Libya that the current actions of Libya could reap dire consequences for all, (d) a reduction in terrorist acts as Qadhafi and his forces would be forced to regroup, and (e) additional time to get other Western nations more involved in antiterrorist operations. On 15 April 1986, the United States, using Air Force and Navy resources, carried out a bombing raid on Libyan targets.**

The results of that raid among enemies:

- **Qadhafi instructed his operatives to deemphasize attacks on US military targets but to look for easier US targets (*Washington Post*, 4 May 1986).**

- **The Soviets contended that Libya's failed defense was a failure of men, not weapons-some Libyan officers were purged.**

- **The absence of any promised Soviet military support and the fact that the Soviet Union and Libya did not negotiate a formal treaty pledging Moscow to come to Colonel Qadhafi's aid demonstrates that the USSR was not willing to back up Qadhafi with more than words (*Christian Science Monitor*, 24 April 1986).**

- **There was a decline in Qadhafi's popularity-and some decline was already ongoing due to economic policy.**
- **The Soviets openly questioned Qadhafi's wisdom-a high Soviet official was quoted as saying "Khadafy is a madman on top of a pile of gold" (Washington Post, 24 April 1986).**
- **Syria publicly and openly rejected the idea that Syria has any connection with terrorist activities.**
- **The Soviets found themselves in a double bind: if they helped Qadhafi too much they would drive him further away from conservative Arab support. If they didn't help him, he might destroy himself and the Soviet foothold in the Middle East.**

Results of the raid among neutral nations:

- **Sixty-five percent of the French people supported the United States and were critical of their own government's nonsupport (Washington Post, 24 April 1986).**
- **Saudi Arabia rejected a Libyan appeal for financial aid (Washington Post, 1 May 1986).**
- **Several Arab nations, while delivering perfunctory denunciations of the United States, privately expressed congratulations. Two Arab countries didn't even issue any complaints (Iraq and Tunisia). Egypt's, Oman's, and United Arab Emirates' official responses were noticeably mild. The newspapers of Jordan and Tunisia did not run editorials on the action (Los Angeles Times, 27 April 1986).**
- **A Libyan call for an emergency Arab summit meeting resulted in Iraq, Jordan, Syria, and Saudi Arabia stating they would be unable to attend.**

The raid's results among friends:

- **There was strong support against terrorism at the Tokyo Economic Summit.**
- **European allies were persuaded to take basic concerted action against terrorism-a blow for reason as well as deterrence (New York Times, 24 April 1986).**
- **Despite an initial outcry, west European countries moved with quiet determination on four fronts: They kicked out a number of Libyan diplomats and suspected agents, significantly increased intelligence through sharing and coordination,**

encouraged their nationals to leave Libya, and quietly cut much of their trade with Libya (*Boston Globe*, 25 April 1986).

In terms of Colonel Qadhafi's own personality, he made no major radio, TV, or personal appearance for almost six months. On the 16th anniversary of his expelling the US from Wheelus Air Base, a major event in Libya to which the foreign press was invited to hear a major speech, Qadhafi did not appear. Fewer than 2,000 attended. Videotapes were presented, revealing an exhausted-looking Qadhafi fidgeting in his chair, speaking in a hoarse voice, and making a speech devoid of his usual fiery rhetoric. This lackluster performance reinforced the belief that' Qadhafi was slow to recover from the shock of the 15 April raid (*Time Magazine*, 23 June 1986). He began to reappear late in August 1986 in both public and TV formats.

The raid's effect on underlying dissatisfaction within Libya can be supported by the following comments:

- **Qadhafi is still in control but soul-searching is under way. He began relooking at Libyan efforts in Chad and Sudan. Some senior Libyan leaders have talked openly about a lower Libyan profile in terrorism (*Washington Post*, 4 May 1986).**
- **The US raid forced Qadhafi to share power with the four members of Libya's ruling Revolutionary Council (*Time Magazine*, 23 June 1986).**
- **A summary of several stories can equate to the notion that the raid may have strengthened Qadhafi in the limited sense that the masses may now not be ready to overthrow him. However, the regular officer corps and influential citizens may be more willing to attempt to modify his behavior.**
- **It should be noted that without US intervention, 10 attempts to remove Qadhafi by members of his military have occurred since 1980 (*Los Angeles Times*, 27 April 1986).**

The reception of the raid by the countries of the world was to some extent known before the raid and should be judged more as action taken than in words spoken. The European allies, recipients of most terrorist acts carried out against the West, are always fearful of additional acts. Since the raid, there has been unprecedented security and the sharing of antiterrorist information. An economic summit took place in which terrorist

activities were discussed and meaningful ground rules were set up by the Western allies.

The raid on Libya appears to have been extremely successful as a psychological operation; yet it is doubtful that it was originally planned as a psychological operation. While any operation can have a psychological component, often that component is not a major consideration in planning and its effects are underestimated. If the raid had been originally planned as a psychological operation, the attack on Qadhafi's personal dwelling would have had to remain on the target list. But the tactical air strike would not need to be as accurate in a PSYOP mission. For example, the use of sonic booms and attacks on less-defended targets would most likely have produced the same results. However, in the final analysis, if senior planners considered the Libyan raid as a psychological operation, it achieved all its goals.

THIS PAGE INTENTIONALLY LEFT BLANK

The Role of Military Psychological Operations in Support of National Antidrug Policy

Maj James V. Keifer, USAF, Retired

War does not belong in the realm of arts and sciences; rather it is part of man's social existence.... Politics, moreover, is the womb in which war develops.

-Carl von Clausewitz

The United States is engaged in a war against a drug culture that threatens to destroy the nation's social-political-economic fabric. The war is being fought on both domestic and foreign fronts against a culture of users and providers of illegal drugs. The national drug control strategy targets both supply and demand. National policy statements by Congress in the Anti-Drug Abuse Act of 1988 and by the president's 1990 strategy statement imply this to be a war of annihilation, but limited two- and 10-year goals make deterrence more realistically the objective of this strategy-detering illegal drug use and trafficking. The US military, as an instrument of national policy, has been brought actively-although with definite limits-into this engagement. To fight the war, the US military establishment has decided-or has had decided for it-to avoid using one of its most potent weapons: PSYOP. Ironically, the US government believes it is important to bring other psychological instruments on both domestic and foreign fronts. If this country expects to achieve victory over illegal drugs, biases against the use of US military PSYOP should be recognized and put aside.

Is the nation truly at risk? What is the national antidrug policy, and what are its priorities, goals, tools, and strategies? What is the role of the US military in pursuing national antidrug policy? How can US military PSYOP be employed to

support the war against illegal drugs? To answer these questions, this essay examines how our national leaders define the threat. It also reviews recent drug policy, strategy, goals, and objectives, concentrating on those roles in which the military and PSYOP are most likely to become engaged.

The Threat Defined

National Security Decision Directive (NSDD) 221 of 1986 defines international drug trafficking as a national security threat to the United States. With the signing of this directive, the president placed illegal international drug trafficking on the official agenda of the National Security Council (NSC). This action established a requirement for the secretary of state to coordinate, through the chiefs of missions, all drug-related assistance, information, and activities within foreign countries. The State Department also served as the link between Central Intelligence and insurgency. The Director of Central Intelligence (DCI) was assigned responsibility to collect, analyze, and disseminate intelligence on the trade of illegal drugs. The secretary of defense was tasked to manage military drug-related activities, including plans, operations, intelligence support, drug interdiction, training of foreign military counterparts, and other related support.¹

Even with the threat established, national policy and objectives were ambiguous at best. Activities reflected need for a national mechanism to coordinate interagency efforts and to provide expert, professional guidance. The political community saw the need for a clear-cut policy to attack the drug problem and put substance behind rhetoric. Things began to move in the terms of Clausewitz, "If war is part of policy, policy will determine its character. As policy becomes more ambitious and vigorous, so will war."²

The President of the United States and the US Congress declared war on drugs with the passing of the Anti-Drug Abuse Act of 1988.³ This legislation established the National Drug Control Program (NDCP) and created the Office of National Drug Control Policy (ONDCP) within the Executive Office of the President, effective January 1989.⁴ William J. Bennett was named director of ONDCP to orchestrate the

activities of participating agencies that were contributing to the combined effort. His position was designed to provide guidance, consistency, and continuity, and to resolve jurisdictional disputes.

Bennett's assignment to head ONDCP, leading a serious combined interagency effort, and to implement a comprehensive program to fight a burgeoning social-economic-medical problem, signaled an increased resolve in antidrug policy. Legislation directed the ONDCP director to set policies, objectives, and priorities for the NDCP and to provide the annual national drug control strategy for the president's presentation to Congress by 1 February each year. Congress required the strategy to include both long-range goals and short-term (achievable within two years) measurable objectives. Further requirements were to (1) define the balance between expenditures for supply reduction and demand reduction and (2) submit a review of state and local government efforts to support the program.⁵

National Drug Policy

Responsible directly to the president for recommending changes in the program's organization, management, and budget, the director of ONDCP serves as the executive branch representative on drug issues before Congress. He or she coordinates and monitors the implementation, execution, and fulfillment of the program's policies, objectives, and priorities by designated agencies. When agencies' policies fail to meet the responsibilities required by the national drug control strategy, the director notifies the agency head and directs that measures be taken to comply. The director also serves as chief consultant to state and local governments on national drug control matters.

The Anti-Drug Abuse Act of 1988 provided the director with three principal subordinates: a deputy director for demand reduction, a deputy director for supply reduction, and an associate director to head a Bureau of State and Local Affairs. The president was responsible for nominating appointees to these positions. When confirmed by the Senate, they were prohibited from simultaneously holding other federal govern-

ment positions.? The act recognized "the magnitude of the illicit drug problem and the threat it poses [to the] national security of the United States."⁸ Disavowing proposals to decriminalize drugs, the act went on to say that "legalization of illegal drugs ... is an unconscionable surrender in a war in which, for the future of our country and the lives of our children, there can be no substitute for total victory."⁹ It then proclaimed, "It is the declared policy of the United States Government to create a Drug-Free America by 1995."¹⁰

The primary executive branch departments and agencies responsible for illegal drug supply reduction activities include the departments of Justice, Treasury, State, Transportation, Agriculture, Health and Human Services, Interior, and Defense; the Central Intelligence Agency, the Agency for International Development, the United States Information Agency (USIA), and the United States Postal Service. Those designated as primaries for demand reduction activities include the departments of Health and Human Services, Education, Housing and Urban Development, Labor, and Veterans Affairs. Additionally, the judicial system and various state and local agencies support the NDCP activities.

As the lead federal agency for the war on illegal drug trade, ONDCP was tasked to outline the national strategy, establish tangible short- and long-term goals, and coordinate and monitor those departments, agencies, and bureaus designated to take the battle to the enemy. The office published *National Drug Strategies* in September 1989 and January 1990. These documents served as the president's reports to Congress on the status of activities and intentions of the National Drug Control Program. ¹¹

Prior to establishing the ONDCP, the Executive Office of the President had promulgated the *National Drug Strategy and Implementation Plan* of 1988. This document identified six presidential goals: drug-free workplaces, drug-free schools, expanded treatment, improved international cooperation, strengthened drug law enforcement, and increased public awareness and prevention. Strategy focused on reducing the supply of illegal drugs, both grown in and imported into this country, and on reducing the demand for illegal drugs in the United States. The plan characterized the drug problem as multidimensional,

involving medical, legal, security, economic, social, and educational aspects. The threat was defined in terms of drug type, production source, production increase, international cartel control, use of high technology, increased violence, and high-profit/low-risk crime.¹² President George H. Bush, in a September 1989 televised address to a nationwide audience, introduced the first strategy produced by the Office for National Drug Control Policy. His presentation outlined domestic and foreign objectives of a multifaceted attack on illegal drugs. On the domestic front, the president said the battle would be fought through programs of deglamorization, education, rehabilitation, and punishment. Foreign measures centered around programs of eradication, interdiction, extradition, and certification.

In his introduction to the 1989 *National Drug Control Strategy*, the director acknowledged that the national policy as articulated in the Anti-Drug Abuse Act of 1988—"it is the declared policy of the United States Government to create a Drug-Free America by 1995"¹³—is admirable but unrealistic.¹⁴ Bennett proposed in its place, "the highest priority of our drug policy must be a stubborn determination further to reduce the overall level of drug use nationwide—experimental first use, 'casual' use, regular use, and addiction alike."¹⁵

This report from ONDCP concluded that the situation concerning illegal drugs was deteriorating rather than improving. Crime, health, and economic factors pointed to a growing problem. (Evidence at the time—figures showing declining casual use—suggested that the problems were primarily caused by addiction.) On both the foreign and domestic fronts, illegal drugs were cited as being imminently available; and the problems were readily evident. Commenting on the need to put realism into the national antidrug abuse policy statement, Bennett charged that a de facto policy vacuum existed. He said it was time to accept the fact that the war on drugs, to be effective, would be protracted in both time and reach. Serious, coordinated efforts and significant resources were needed to get a grip on the demand for and supply of illegal drugs.¹⁶ Saying it would lead to a national disaster, Bennett articulated his adamant opposition to proposals for legalizing drugs.¹⁷

While building on the strategy from the Executive Office of the President, the 1989 *National Drug Control Strategy* was more than mere restatement of the 1988 plan. Unrealistic goals were rewritten and valid strategies were reorganized. The 1989 document outlined the national priorities as: (1) the criminal justice system, (2) treatment programs, (3) education, community, and business actions, (4) international initiatives, (5) interdiction activities, (6) research, and (7) intelligence. As mandated by the Anti-Drug Abuse Act of 1988, two- and 10-year objectives were listed. A statement on the process of implementing the national priorities was submitted with funding requirements. State- and local-level legislation initiatives were proposed to add consistency to activities below the federal level. The report articulated the importance of comprehensive information management to the program.¹⁸

The strategy recognized the contributions of a comprehensive information management program to the success of the antidrug campaign. In Bennett's introduction of the strategy, he expressed that coherent and coordinated policy-making depended upon the timely sharing of information. "Our national policy must be to maximize the sharing and use of relevant information among appropriate government organizations and to minimize impediments to its operational use."¹⁹ He focused on improving automated data-processing systems and command, control, and communications (C³) networks. In this context, information management referred to the intelligence function and communications systems rather than programs to provide people with educational material or persuasive information.

While the 1989 *National Drug Control Strategy* outlined initiatives that targeted supply-side activities, no relevant clear-cut policy statement on them was articulated. To remedy this omission, Bennett stated in the 1990 report that "the policy of the United States is to disrupt, to dismantle, and ultimately to destroy the illegal market for drugs."²⁰

The 1990 *National Drug Control Strategy* was essentially a continuation of the previous year's strategy. Its major goals included (1) restoring order and security to American neighborhoods, (2) dismantling drug-trafficking organizations, (3) helping drug users break their habits, and (4) preventing

those who have never used illegal drugs from starting. The strategy again called for cohesive, multifront attacks on both the supply and demand sides of the drug problem. In addition, the program's purpose was (1) to reduce to the maximum degree possible illegal drug supply and availability, (2) to provide treatment for users of illegal drugs and to actively discourage people from becoming involved with illegal drugs, and (3) to provide robust enforcement of drug laws by holding traffickers, sellers, the money-laundering structure, buyers, and users accountable.²¹ National priorities for the strategy were directed as follows:

1. strengthening the criminal justice system,
2. expanding and improving drug-treatment programs,
3. developing programs to keep illegal drugs out of education systems, communities, and the workplace,
4. pursuing international initiatives,
5. enhancing interdiction efforts,
6. building on the research agenda, and
7. coordinating the intelligence agenda.²²

Both supply and demand aspects were targeted for attack by the criminal justice system through actions to deter the use of illegal drugs, to disrupt the trafficking network, and to arrest, prosecute, and punish drug criminals. The 1990 strategy reinforced the 1989 strategy, which called for dismantling trafficking systems by apprehending and prosecuting organization leaders and accomplices, and by taking away their illegally acquired wealth. The goal of additionally holding buyers, sellers, and users accountable was to make illegal drugs less desirable, more expensive, and harder to get.²³

The Office of National Drug Control Policy recognized that the US could not expect to unilaterally win the war against illegal drugs. The 1989 international strategy was designed to disrupt and dismantle the multinational criminal organizations that support the production, processing, transportation, and distribution of drugs to the United States and to other nations. Building on that strategy, the 1990 programs were aimed not only at drug-producing, transit, and consumer countries, but also toward nations still experiencing few or no problems with illegal drugs by helping to strengthen resolve and resistance to

use and trafficking inside their territories. The 1990 report articulated the need for international cooperation if objectives were to be met.

Three near-term goals the national strategy sought to attain in the international arena were as follows:

- 1. providing support to help strengthen the political will and institutional capabilities of three Andean Ridge countries (Colombia, Peru, and Bolivia) by enabling them to fight illegal drug-producing and drug-trafficking organizations in their respective countries,**
- 2. helping law enforcement and military structures of the three countries to combat cocaine trade more effectively, and**
- 3. incapacitating trafficking organizations that operate in the three countries. To ensure understanding of and to develop support for the measures, the 1990 strategy tasked that "U.S. information and public awareness programs will explain and support the attainment of the three goals outlined above."²⁴**

The 1990 strategy added a new dimension-the implementation of international public information initiatives to directly support other international policies and programs. "An active public information campaign will provide vital information to foreign publics, leaders, and government officials to build support for United States and host country actions to combat drug production, trafficking, and consumption."²⁵ Receiving policy guidance from the Department of State (DOS), the USIA (with support from other federal agencies) was assigned responsibility for coordinating and leading the international information effort. These initiatives focused on informing foreign audiences about the problems caused by illegal drugs with respect to their national security, economic welfare, and environment. International information programs were to educate foreign audiences about the consequences of using illegal drugs. Another initiative of the international information program was to describe the US domestic drug problem and the progress experienced in fighting it.²⁶

The 1990 *National Drug Control Strategy* included a commitment to long-term research in the fields of treatment, education and prevention, criminal justice, and drug use.

Research provided a base of knowledge for fighting the drug problem and a foundation for future strategies. Research projects included these:

1. developing enhanced databases on drug production and consumption, and on the economic impact of drugs, including cost/benefit analyses of programs designed to reduce drug use;
2. developing regional and state drug-related data to improve the analysis and accuracy of assessing drug control effectiveness;
3. expanding domestic programs to collect information on illegal drugs and their use;
4. increasing scientific and technological research projects focused on strengthening drug enforcement and interdiction capabilities; and
5. increasing research into drug treatment to emphasize complications caused by addiction, acquired immunodeficiency syndrome (AIDS), and pregnancy.²⁷

The intelligence agenda, designed to understand and fight illegal drugs better, included acquisition, analysis, and management of information. The National Drug Intelligence Center was tasked to coordinate, consolidate, and distribute pertinent information to appropriate agencies. Responsibility for coordinating and overseeing drug-related intelligence-gathering activities of the national foreign intelligence community was tasked to the DCI. The strategy required all members of the nation's foreign intelligence community to share data relevant to drug trafficking and drug-related money laundering. This included requiring DOD's intelligence components to actively support the collection of foreign drug-related intelligence requirements outlined in the *National Drug Control Strategy*.²⁸

To effectively manage the National Drug Control Program, ONDCP established coordinating mechanisms, developed report and study requirements, and set up systemic measures to oversee priority objectives. The Supply Reduction Working Group, the Demand Reduction Working Group, the Research and Development (R&D) Committee, and the Drug-Related Financial Crimes Policy Group were created to coordinate

interagency activities. Drug control program agencies were created within federal departments, agencies, and bureaus to manage the organizations' internal activities and serve as single points of contact for responding to drug issues. Lead agencies were designated to direct, coordinate, and provide expertise to specific activities. Management studies included the Executive Reorganization Study, the Department of Justice Reorganization Report, the R&D Facilities Plan, and reports on communications and automated data-processing initiatives. The Office for Treatment Improvement was created within the Department of Health and Human Services to lead the federal effort to improve the nation's drug-treatment activities. Information clearinghouses were set up in departments, agencies, and bureaus to access data readily. The National Drug Intelligence Center was established to oversee information management. Statutes were implemented at state and local levels to deny convicted drug offenders access to specific federal benefit programs. A programming and budgeting system was created within ONDCP. Model legislation on drug-free workplaces was provided to state and local governments.²⁹

Information management initiatives-developing command, control, communications, and intelligence networks-were built on the previous year's strategy. The only notable difference was in the change of the terms from communications to telecommunications. The strategy again focused on upgrading hardware, integrating systems, and providing means for secure communications. The DOD, as executive agent for implementing communications systems, created the Counter-Drug Telecommunications Integration Office within the Defense Communications Agency to serve as the focal point for all telecommunications activities related to the enforcement of drug policy.³⁰

An Assessment

Both the president (NSDD 211, 1986) and Congress (Anti-Drug Abuse Act, 1988) unambiguously articulated official positions that illegal drugs are a threat to national security. They agreed that the political objective, elimination of demand for and supply of illegal drugs, deserved an extensive effort and merited significant expenditure of resources. The problem

was identified in global terms with an objective to co-opt worldwide support for counternarcotics initiatives. War was declared-not the conventional sense of a military shooting war (although blood most certainly was to be shed), but one of police actions, economic sanctions, information activities, social programs, and other nonmilitary means.

The enemy in this war is the drug culture-drug cartels and drug users. The drug cartels cannot be likened to the contemporary economic entities; a cartel is a flexible system of organizations involved in growing, producing, transporting, distributing, selling, and money-laundering processes. High profitability has provided them an immense resource base. The cartels are motivated by profit rather than ideology. Users of illegal drugs cut across the full spectrum of society, from the homeless to professionals to influential leaders. The group includes both casual and addicted drug abusers. Their motivations for using illegal drugs are equally diverse.

Just as the war against illegal drugs is not fought against a conventional enemy, it should not be considered an ideological conflict. It is unlike most other political wars including the War on Poverty waged by the Great Society during the 1960s. Because the drug problem transcends many cultural boundaries, care must be taken to consider relevant issues such as social, health, safety, and economic factors, and to avoid morality issues. In seeking international cooperation, the perception of selling American values to other countries must be avoided. Actions and propaganda should be controlled, so as to preclude being tagged "Yankee imperialism" or "American hegemony."

The closest parallel we have to this war is the battle against alcohol that took place during prohibition-a war that was lost but that certainly compromised national objectives. Proponents of legalization can be expected to argue the logic of prohibition repeal in their efforts to sway the public to support such measures. The reasons for prohibition's failure must be understood if history is not destined to repeat itself. Care must also be taken in arguing against legalization to avoid the pitfalls of incomplete truths and invalid logic that cannot stand the tests of intense scrutiny or time.

The Anti-Drug Abuse Act of 1988, in declaring that national policy was to make a drug-free America by 1995, reflected election-year rhetoric. Remarkably, the political process that created this legislation didn't prevent the promulgation of a generally comprehensive³¹ and reasonably good product-but it did serve to dilute some of the potential it carried. While putting together a product calculated to appeal to the American public, members of Congress ensured that their power would not be diminished.³² Appropriately, the legislation directed attacks against both supply and demand of illegal drugs.³³ It also stressed both counterforce and countervalue strategies. With respect to one strategy that has been suggested by some-the legalization of certain drug offenses-Congress refused to compromise.³⁴ On the positive side, the single-point manager established a mechanism for coordinating efforts and resolving disputes. The requirement that leaders of the ONDCP not hold any other public office kept the president from appointing part-time people.³⁵ On the negative side, the political nature of the legislation tied the effectiveness of the program to (1) its position on the president's agenda and (2) its proximity to election day.

Supply-side measures receive the attention of Congress, but the trafficking of illegal narcotics isn't their exclusive target. Prevention and treatment programs for this legislation demand side attention. Certification requirements focus on governments of countries in which drugs are produced and through which they transit. Measures to break up money-laundering schemes put pressure on a shadowy support structure that helps the cartels to reap the huge profits of their trade. Opposition to decriminalizing illegal drugs, while supportive of the national policy stated by Congress, will eventually generate the requirement to produce facts from research to support this stance.

The most notable shortcoming of the legislation is the comparatively little formal authority given the director's position, particularly in the light of its extensive responsibilities. The director has few immediately assigned resources and only limited fiscal control. While Congress is expected to keep its control over the purse, authorizing the director to manage the

distribution of confiscated assets/ resources would provide the position with a significant carrot for resolving turf battles.

Most of the combatants in the drug war are assigned to the numerous supporting departments, agencies, and bureaus. With no formal control over them, the director must resort to convincing, persuading, or otherwise getting these supporting elements to do the work according to plans. Resolution of problems and conflicts tends to be a matter of Capitol Hill politics,³⁶ a personality-dependent requirement ideally suited to a person with good diplomatic skills. Disagreements of consequence must be resolved by the president or significant others in the Washington community. Further, few would argue that the director's position holds stature equal to such leaders as the secretary of state, secretary of defense, attorney general, or national security advisor. Not a formal member of the cabinet or the NSC, the director sits in only when the topic of illegal drugs is on the agenda.

Articulating the national policy for demand-side measures, Bennett's September 1989 *National Drug Control Strategy* changed Congress's declaration from unrealistic (drug-free America by 1995) to inconsequential (reduce overall level of drug use). Only one of the strategy's two- and 10-year goals³⁷ serves to measure the ultimate objective of the national policy statement for supply reduction to destroy the illegal market for drugs. The objectives and strategies formulated by the ONDCP represent a significant step forward from the Just-Say-No! domestic policy and interdiction instruments of the Reagan administration. Recognizing the complexity of the problem, the strategy addresses supply and demand, domestic and foreign arenas, law enforcement and prevention and treatment programs, counterforce and countervalue measures, and casual use and addiction. Quantified objectives are provided to measure some effects of the program. The two- and 10-year goals appear to be realistically achievable, even possibly unambitious. (Figures show a steadily diminishing demand for illegal drugs.) Bennett's uncompromising position on decriminalization is based on emotional grounds. Research needs to be directed to prove the validity of this position; that the effects of the drugs themselves, rather than their criminal status,

have accelerated and amplified social, economic, health, and safety decay.

The strategy outlined in the reports by ONDCP has many strong points. It states that one strategy alone will not win the war. Efforts to reduce the demand cannot be expected to work without measures against supply production and vice versa. The high profitability of drug trafficking will lead to aggressive marketing efforts by the cartels to counteract gains of demand-side programs. Interdiction efforts may thwart transportation networks and make smugglers think twice before trafficking the products, but cartels will fight these measures by cultivating new markets, developing new transportation strategies and transit routes for their products, and increasing rewards to their couriers. By the same token, supply-side measures alone can be unsuccessful. As long as drugs are available to tempt people, a portion of the population will use them. Treatment programs are extremely costly and none has escaped problems with recidivism. Incarceration is likewise costly and has hardly proved effective when not supported by other measures.

Research and development (R&D), essentially an investment process, is the primary way this nation will come up with different and improved ways to fight illegal drug use. It serves as the tool for innovating new ideas and technologies. The commitment to R&D acknowledges the long-term nature of the war against drugs. One of the foremost obstacles the ONDCP faces is a dearth of accurate, up-to-date information concerning illegal drug use. Previous surveys were conducted too infrequently and were of limited or irrelevant scope. They lacked sufficient scientific rigor to be reliable measures. This was one of the primary factors for understated program goals of the initial strategy published in September 1989. Funding for databases will enable them to be expanded and updated more frequently, increasing both the reliability and utility of the information gathered. Some R&D projects are being designed to improve the effectiveness of prevention and treatment programs by helping to reduce the demand side of the equation. Other programs are being advanced to improve technology for detecting drugs and for systems to compile, communicate, and coordinate information to help supply-reduction efforts.

Recognition of the need for international consensus is an important element of the program. Not only are bilateral agreements needed with drug production and transit countries to help them fight their internal enemies, but worldwide cooperation is also an instrumental part of finding a solution to this global crisis. Crop eradication projects will still take place, but the program has been deemphasized because of some counterproductive effects. (As drug-producing plants constitute the primary cash crop in many Andean Ridge countries, many farmers side with revolutionary factions, creating additional problems for their governments.)

Another key element to the strategy is the importance given to information, education, and publicity programs (essentially, programs of advocacy under politically palatable titles) on both domestic and foreign fronts. The success of information strategies relies on communicating in understandable terms the consequences of illegal drug activity. Some initiatives are designed to persuade nonusers not to start, users to seek treatment, and traffickers to cease their activities. Because international understanding and backing are imperative to the ultimate success of this program, other initiatives seek support from the world community for our national objectives.

The formation of coordinating committees is another program strength that promotes the sharing of ideas, resources, and information.³⁸ These committees establish mechanisms to prevent one agency from unwittingly doing something that conflicts with other efforts. This initiative improves cost-effectiveness and prevents potential fratricide. A notably missing committee is one to coordinate publicity, information, education, diplomacy, and persuasion activities of federal, state, and local agencies.

The strategy is not without its share of weaknesses. Because it is a long-range program, it will test the national patience of people who are accustomed to instant gratification. This constituency in turn will challenge the resolve of politicians whose primary concern is their own reelection. These same policy architects, if they don't perceive the threats-the threat drugs pose, and threats to reelection-as imminent, will most likely prove unwilling to commit sufficient assets over the long run to achieve success.

While expenditures have increased dramatically, the total program budget compared to low-end estimates of profits made by drug traffickers gives the impression that the administration is still trying to win votes rather than the drug war. This is particularly true because funding is dedicated to supply-reduction measures. Less than one-fifth of antidrug funding goes to prevention and treatment programs. Funding for prevention and treatment, as well as alternative programs, gets the short end of the stick when compared to the amount given to the interception of smuggled goods.

The strategy for providing support to state- and local-level government programs relies on the provision of matching funds by the lower levels to qualify for the federal money. This reliance depends not only on the availability of funds for these purposes but also on political popularity. To attract popular support to raise the taxes needed to fund these programs, results will have to be visible with high payoffs.

The inclusion of measurable objectives is laudable, but the selected objectives-with the noted exception of drug availability reduction-tend to measure only the demand side of the program. While this helps to dissuade "body-count" tactics, these objectives fail to measure the effectiveness of component strategies and programs.

The national policy of interrupting cartels as a departure point to their eventual dismantling and destruction implies a short-term goal of harassment. It serves to challenge cartels to produce new ways to circumvent measures. The absolute nature of the national policy-ultimately to destroy the illegal market for drugs-represents the objective of annihilation. If this is not wishful thinking but the true goal, then half-hearted measures will fail in the long run.

Bringing the military into the counternarcotics strategy was an expedient decision for the political leadership, but one the military leadership looked upon with skepticism. The political side saw it as a way of putting defense dollars to a tangible use. Political reasoning generally followed this theme: while ships and planes are out on training missions, they can be on the lookout for drug smugglers. The military establishment saw itself being dragged into a war with no measurable objectives; a war that could not be won. Through appropria-

tions bills, Congress provided funds to fight the drug problem, thus easing military apprehensions about taking the costs out of the operating budget. Defining the Defense Department's fiscal authority for 1990, Congress dedicated \$450 million to counterdrug activities.³⁹ This funding included \$28 million for R&D projects and \$40 million for catchall expenses defined as additional support to the Office for Drug Control Policy.^{40, 41} The bulk of the spending authority, \$182 million,⁴² was to support interdiction in its lead role of detecting and monitoring aerial and maritime smuggling activities. While the added fiscal authority generated interest, the lack of significant measures of effectiveness make military counternarcotics activities a, readily available political and media target. Coupled with operating restrictions, in spite of the loosening of the *posse comitatus* statute, DOD resources offer more potential than support. Its role as lead agency in the C 3 arena should easily show more cost-effectiveness than interdiction responsibilities when networks are completed and figures come in.

If national objectives in the war against illegal drugs are met, the achievement will ultimately be a psychological one. Activities must be carried out on both domestic and foreign fronts. They must target both supply and demand cultures, support counterforce and countervalue measures, and address prevention and treatment. National resolve must be communicated in clear and concise terms. Persuasion will require both action and propaganda.⁴³

For political reasons and other expediencies, these messages will have to be carried to their audiences by many different agencies. The 1990 strategy announced campaigns to provide information to foreign audiences. In the Anti-Drug Abuse Act of 1988, Congress established the requirement for the Office of National Drug Control Policy to activate a program to publicize the penalties for violating the legislation.⁴⁴ Agency turf battles during World War II and the American cultural distrust of the psychological instrument led to prohibitions against the USIA's communicating directly to a domestic target audience. Similarly, the *posse comitatus* statute and other restrictive measures prevent US military resources from conducting ac-

tivities intended to influence US citizens. Domestic programs, therefore, must be carried out by other agencies.

In the foreign arena, the psychological dimension must be exploited by all agencies involved in activities. Actions must be reinforced by publicity campaigns to ensure that maximum benefits are reaped. Successes must be underscored and punctuated, letting others know that alternatives exist and that consequences are in store for unacceptable behavior.

Co-opting the support of nongovernment special interest groups is another potential role for the psychological instrument. Informing the public of the harm illegal drugs do to the environment, the economy, the health, and ultimately the strength of a nation could serve to coalesce and polarize "watchdog" groups, directing outrage and magnifying public opinion against cartels and their support structures. For instance, environmental groups such as Greenpeace might find that the rape of the Andean Ridge ecosystem is a target for one of their campaigns. The focus of attention by television programs such as "60 Minutes" on chemical companies that exercise irresponsible management of precursor materials might cause them to rethink their motives for profit and to tighten control mechanisms.

The top echelon of the cartel structure is not invulnerable to psychological inducements. For all their wealth, they are virtual prisoners, unable to attain status or to travel any appreciable distance from their fortified homesteads. Psychological initiatives can highlight and amplify the social isolation these people face. Rivalries between cartels can be exploited, as can rivalries between ideology-motivated revolutionary movements and the greed-motivated cartels.

The across-the-board rejection of any form of decriminalization places an even greater demand on the psychological dimension. Diplomacy has been described as a process of political compromise between nations.⁴⁵ Because the drug culture has no national identity and because compromise has been determined unacceptable, diplomacy would seem to be limited to securing international cooperation from nations predisposed to strong antidrug policies. The goal is to convince people not to use illegal drugs, to convince cartels that it isn't in their profit-motivated interest to traffic illegal drugs, and to

convince the world community to act together to stop the trafficking of illegal drugs. Two overriding principles should guide the psychological effort: (1) truth is the best propaganda; and (2) words must follow action.⁴⁶

To support the first principle, the government needs to intensify its R&D studies to come up with irrefutable reasons not to decriminalize drugs. These studies should compare health and safety, sociological, and economic factors upon which illegal drugs are claimed to have an impact, comparing states and nations that have and have not decriminalized drugs. This type of research should then establish a mechanism to control the impact of the criminal status of drugs. Emotional appeals will only have temporary effects on the behavior of their target audiences. A comprehensive interagency campaign using facts should be developed by a coordinating committee. Likewise, morality inferences concerning drugs must be carefully tailored to the morals of target cultures.

While it has been written that words are mightier than the sword, they must be based on substance. The principle that propaganda must follow action recognizes that the propagandist shouldn't make claims he is not willing to back up or promises he can't keep. Credibility is ideally established through performance of actions that serve as examples of what may be yet to come. This performance establishes both capability and resolve. If the government seeks to alienate cartels from their surrounding populaces by promising to reward and protect informants, it must be prepared to back up its words or suffer from challenges to its resolve.

Alternatives must be either available or provided. For instance, coca-growing campesinos cannot be expected to voluntarily stop growing a profitable cash crop without the assurance they will receive a reasonable price for harvesting something not considered illegal. Likewise, others throughout the cartel structure must see some viable way to generate an income if they are to be induced to get out of the drug-trafficking business.

Where then does the US military PSYOP community fit into the equation? First and foremost by ensuring that the actions of DOD (maritime and aerial interdiction and detection; monitoring and developing C3 networks) are favorably

communicated to the world community. This supports the premise of following actions with words-making would-be smugglers aware of the diminished likelihood of their success and profit, and broadcasting the nation's resolve to stop drug trafficking. Another role is in working with foreign counterparts to help them master the use of psychological instruments against illegal drugs. For countries whose military forces are used to combat drug traffickers, US military PSYOP forces can conduct seminars on the value of psychological operations, train their contemporaries, and participate in bilateral exercises to hone skills. For those countries whose enforcement agencies are civilian, US military forces can support USIA programs of assistance.

Direct measures to communicate with foreign civilian populations, while not out of the scope of possibility, are more appropriately the responsibility of the USIA. That doesn't preclude a military PSYOP role but suggests coordination of ideas, information, and efforts. This role can be particularly important because the lead agency suffers from a significant funding lack, given its responsibility to execute the national strategy.

If the US government is to destroy the market for illegal drugs successfully, the psychological dimension will be a significant factor. Military PSYOP resources can contribute to achievement of the national objectives, but only if they are allowed to be used. To that end, institutional biases will have to be broken. Ironically, such a breaking of biases is a psychological phenomenon. This process will include overcoming Western cultural fears of manipulation, resolving interagency turf battles, motivating the military establishment to consider nonlethal weapons, and educating the members of the media. These audiences must be made to understand that psychological activities are amoral,⁴⁷ that they support national policy, and that advances in technology have made far-reaching communications faster and stronger.

Dyer states the need for a national college to educate leaders on the nature of the instrument and how it helps them to implement policy.⁴⁸ The public, he says, "must be educated on what these activities are and how they contribute to functioning of the government."⁴⁹ Within the military community, education on the psychological dimension needs to be expanded. In

addition to courses of instruction at the Air Force Special Operations School at Hurlburt Field, Florida, and the US Army John F. Kennedy Special Warfare Center and School at Fort Bragg, North Carolina, blocks of instruction should be included in service academies and in professional military education courses at all levels. The Defense Information School at Fort Benjamin Harrison, Indiana, should include psychological operations orientation in its military public affairs training curricula. Select members of the media should be invited to attend military orientation courses.

Bennett resigned from his position as director, commenting that he had accomplished what he had set out to do. Acknowledging that the war was not yet won, he offered that indicators were showing great promise.⁵⁰ His abrupt departure provided focus on a national program whose status was being subordinated by events in the Middle East. The war is still far from over, and it will not be over until the national policy is achieved or rescinded. While national policy is likely to undergo redefinition, particularly as accurate and up-to-date information enhances the nation's databases, rescission is unlikely. Changing peoples' attitudes, opinions, and behavior will be a long-term psychological process—a process to which the military PSYOP community has much to offer. The sooner political and military leaders recognize this, the sooner the problem will be resolved.

Political-Psychological Dimensions of Counterinsurgency

Gen Richard G. Stilwell, USA, Retired

This paper concentrates on the psychological aspects of conflict because the psychological dimension deserves discrete treatment as the least appreciated dimension-and the least employed-by the United States and most of its allies. Conflicts erupt among groups of men, nations, or coalitions of nations from collision of aims or objectives for which the antagonists are prepared to fight and die. The conflict ends, at least temporarily, when one side makes the decision that there is more to be gained-or less to be lost by allowing the antagonist to prevail. The side that desists has simply lost the will to continue the conflict.

An adversary's will can be eroded and broken in a number of ways: by military force (the application, or threat of application, of violence); by economic strangulation; by loss of external support; by apathy; and by military defections. Normally, it takes a combination of these to bring about an adversary's calculus that the "jig is up." Sometimes, one master stroke will suffice. Hopefully, nations can resolve the issue without the application of military force. To win without fighting, in the words of Sun Tzu, is "the acme of generalship." Any political leader or military commander should accomplish the mission in the most expeditious fashion and at minimum human cost.

The term psychological warfare (psywar), for all its shortcomings, succeeds in combining two meaningful subjects, both as old as man. Certainly, it is better than psychological operations which, as my mentor Paul Linebarger once said, leaves the issue entirely neutral. Psychological warfare seeks to achieve the objective where military force is unavailable or

inappropriate, or where it can combine with the military to minimize expenditures while maximizing effects.

The Old Testament's "Book of Judges" provides one of the earliest and most effective examples of psychological warfare. Gideon-an imaginative fellow-and his troops were on the verge of being annihilated by a Midianite force of vastly superior strength. The Midianites were encamped in preparation for decisive assault on the morrow. But Gideon had an inspiration: Since the basic fighting unit of all armies in the thirteenth century B.C. was a 100-man formation, each with one trumpeter and one torch bearer, he reckoned he could create the impression of a 30,000-man force with 300 men properly equipped. Gideon selected 300 men and provided each with a lamp, a water pitcher, and a trumpet (we are not told where he found the extra trumpets!). At nightfall, he had the 300 light their lamps (which were placed inside the pitchers so as to hide their light) and deploy at designated intervals around the Midianite camp. On his signal, they all broke their pitchers, lighting up the perimeter, and blew madly on their trumpets. The Midianites were startled out of their sleep and their wits. They fought among themselves, then gave up and retreated. (The Hebrew chronicler gives credit for this to the Lord!)

Gideon's deception is not an isolated example, as any serious student of ancient military history can confirm. Psychological warfare seeks to persuade by nonviolent means. By its very nature, psychological warfare is open-ended; it defies an accurate all-encompassing definition. The best descriptor-although by no means all-inclusive-is propaganda, which unfortunately, has severe political handicaps on the American domestic scene. It ought not be in such disrepute; after all, it derives from the name of that department of the Vatican Curia which had the duty of propagating the faith. Propaganda is simply the *planned* use of any form of communication designed to affect the minds, emotions, and actions of a given group for a specific purpose. This is precisely the aim of what we see on the television screen at all-too-frequent intervals-a field of endeavor in which the United States is preeminent.

So, psychological warfare is really not all that esoteric or mysterious. Whether in support of the national security or for

the profit of shareholders, the effectiveness of propaganda depends on adherence to four basic ground rules: a clear-cut aim or purpose, a well-defined target audience, a credible message, and a reliable means of communication or dissemination. Gideon met these criteria in spades. His aim was to demonstrate that he had been greatly reinforced; his target audience was the immediately opposing army; the established rules of counting made his message credible; and the light and noise ensured that the message was received. To be sure, it is rarely that easy; or as quickly mounted; or as clearly measurable.

The American View of Psychological Warfare

The psychological weapon has never been accepted as a permanent instrument of national security policy by the executive branch, the Congress, or the American people. Its use, under various names, has been supported as an essential expedient only in periods recognized as war. To be sure, in the early days of the cold war, there was considerable enthusiasm for institutionalizing a national structure and capability to exploit international communications as a psychological tool in furtherance of national policy.

The concept was never implemented, due in part to substantial differences within the executive branch about the value and propriety of this genre of activities. These differences precluded the enunciation of an integrating doctrine and the necessary coordination of departmental programs. In greater part, however, the failure to implement was due to the American character, which is at once idealistic and pragmatic, distrustful of political intrigue, and impatient for quick solutions. These traits are reinforced by the rather simplistic and innocent view of the world that most Americans have.

For these reasons, instances of US attitudinal readiness-and US capabilities-to engage in psychological warfare have been rare, coinciding with the two world wars. Those efforts were indeed national because the target audience conspicuously included the American public itself. But while psychological operations in the two world wars (particularly the British in World War I) provided important support, they were not

crucial to the final outcome. Those conflicts were waged militarily, with political and psychological assistance.

Wars of national liberation reverse the weighting of factors. They are fought politically and psychologically, with the assistance of military capabilities. They integrate political, psychological, social, and military aspects to exploit national vulnerabilities, erode all national institutions, and support an eventual insurgent takeover. Their choice of weapons puts a conventional high-technology force at a disadvantage. The psychological challenge is explicit in the hallmarks of the insurgent force: its tight, inner political structure; the strong motivation of all ranks; the ability to find concealment within the civil population; and identification with one or more popular causes.

Past Experience in Counterinsurgency

The wars of national liberation that have erupted in the third world over the past four decades document the crucial role of the psychological weapon in determining the final outcome. Not all involved the United States, even indirectly; but all were replete with useful lessons for those perceptive enough to appreciate and assimilate them. In those instances where the United States was in some way engaged, its record in exploiting the psychological dimension is uneven. Two examples will serve to support this judgment.

The Philippine government campaign against the Huks in the early 1950s stands as a model of the imaginative employment of psychological warfare, strategically and tactically. The charismatic and insightful Secretary of National Defense, Ramon Magsaysay (who was later to become president), and a small cadre of exceptionally gifted US advisors, achieved spectacular success in arresting the momentum of the insurgency and then breaking its back with a wide-ranging series of programs which integrated military, political, and psychological actions. Most of the ideas and initiatives were conceived by the advisors, but-and this is important-the detailed planning, the message content, and the operational execution were all Filipino.

Magsaysay knew instinctively that the key to defeating the guerrillas was to deprive them of support within the rural population and to swing that support to the government. He also recognized that the soldier was the most visible symbol of government in the countryside and that the government would be judged by the actions of its soldiers.

As a first order of business, therefore, Magsaysay set about reindoctrinating the entire Philippine army. Its multiple roles were protector of the people, guerrilla fighter, and contributor to the morale and welfare of the civil population. He made this indoctrination meaningful by promoting only those who were demonstrably effective ambassadors of good will and were also effective combat soldiers. He provided rations for the troops that were adequate not only for their own consumption, but also for donations to villagers in dire need, and he made extensive use of medical and engineer personnel for civic actions of the most basic sort. Finally, Magsaysay established a "hotline" to his immediate office for complaints about troop malperformance and a staff to immediately investigate those complaints in the field, convincing one and all that he was serious about making the army a credible symbol of good and caring government.

Every effort was made to publicize, nationwide, the new order in the army and what was being accomplished thereby. To accomplish this, Magsaysay used press releases, unit newspapers for troop consumption (and for subsequent distribution to local civilians), movies of operations and civic actions (for showing in remote areas by civil affairs officers), and traveling road shows. Programs to win the support of civilians were complemented by others directed at the insurgents themselves.

One such program provided surrenderees (and even those who had been captured) the wherewithal to start life anew for self and family: substantial acreage in a resettlement area and a loan of building materials, tools, food, and seed. This program stimulated many surrenders, but its indirect effect was even greater. Much of the population had supported the guerrillas because their avowed motive was to gain "land for the landless." When it became apparent that the objective

could be achieved without fighting, the moral obligation to support the guerrillas disappeared.

A second program involved liberal rewards for the death or capture of Huk leaders who were brought in or killed by their own comrades. The principal values of this program lay in widening the gulf between civilians and guerrillas, and in heightening hostilities within the guerrilla ranks. Accompanying these major programs were more specifically targeted initiatives: appeals from mothers to their guerrilla sons; rumors to destroy the credibility of those politicians who were deliberately obstructing the Magsaysay programs; widespread distribution of posters exposing Huk leaders as criminals wanted for documented murder, kidnapping, and rape; and exploitation of native superstitions.

The concomitant of steadily increasing popular support for the government-as symbolized by the army in the field-was better intelligence and more effective operations against the guerrillas. By 1953, the insurgency was no longer a menace to the national security of the Philippines.

What lessons can be drawn from the significant contribution of psychological warfare to the success of the Philippine counterinsurgency campaign? One is that Magsaysay had his priorities right. In most third world countries, the soldier in the field is the embodiment of the government. His conduct will determine the nature of the relationship between the population and the government in rural areas. The soldier must therefore be made the most useful symbol possible, demonstrating the moral justification for government. It is a nondelegable command responsibility, at all levels, to ensure this.

Another is that several factors combined to swing popular support to the government through actions of the Philippine military:

1. leadership and command emphasis (notably including careful indoctrination of the soldier);
2. a dedicated element in each headquarters to plan and supervise implementation;
3. psywar programs carefully tailored to the attitudes and needs of the groups at whom targeted; and

4. quality advisors with the professional competence, empathy, and passion for anonymity to gain and maintain access to the decision makers.

No one spent any time attempting to define boundaries of, or responsibilities for, conduct of psychological operations. It was everybody's business to support the overarching aims: develop confidence in the government and render the insurgency futile. This was achieved by the remarkable integration of concrete and useful actions, increasingly effective field combat operations, and support from information/psywar initiatives.

Vietnam was an entirely different story. There was an illuminating exchange between Col Harry Summers and a North Vietnamese officer in Hanoi during the prisoner of war exchange negotiations in 1973. Summers made the point that the American army had never been bested in battle to which the response was "Quite true, but that is totally irrelevant." The communists' political and psychological campaigns were decisive-on the international scene, within the American body politic, and in-country. The tragedy is that our failure to mobilize international and domestic support for the Nicaraguan Freedom Fighters mirrored our Vietnam experience in those key arenas.

A comprehensive and authoritative account of psychological operations in Vietnam has yet to be compiled. When accomplished, it will record some brilliant successes at the tactical level and some failures at the strategic level. The latter included an inability to cope with the impact of modern mass communications (history's first televised war); the lack of psychological/ political actions to condition audiences and establish context for major military activities as, for example, the invasion of Cambodia; inability to erase the perception that it was our war, not a South Vietnamese war; and ineffectiveness of advice and resources devoted to aid the government of South Vietnam to make its case, improve its image, and enhance its performance on and off the battlefield. Responsibility for these failures did not rest solely-or even predominantly-with Joint US Public Affairs Office (JUSPAO). It was shared with the political and military leadership in Washington and in-country, with United States Information Agency (USIA)

ambivalence about the merits of psychological warfare and its role therein, and with a military educational system that failed to inculcate in all ranks the fundamental tenets of counterinsurgency.

This evaluation in no way denigrates the dedication of the JUSPAO leadership and members. And, in all fairness, even programs of heightened impact would not have resulted in a different final outcome. Psychological warfare can enhance political, social, and military programs; but if those programs are seriously deficient, it cannot erase their faults.

The differences between the Philippine and Vietnamese experiences are dramatic.

- **In both cases, the key objective was to win the support of the population. In Vietnam, that objective was not achieved. Admittedly, the Vietnamese government faced much more difficult challenges, explicit in a more numerous, better organized, more deeply imbedded, and more highly motivated opposition.**

- **Unlike in the Philippines, psywar personnel in Vietnam did not have direct and continuing access to the top political and military leadership or to the high-level planners. A number of first-class research projects, which were developed by social scientists, political psychologists, and cultural anthropologists, constituted guidelines for effective psychological initiatives. For the most part, these projects were simply filed.**

- **The Philippines' psychological programs were indigenous in content and means of communication. In Vietnam, impatience (to which short tours contributed) stimulated the Americans to do too much themselves. Not only was this conceptually wrong, it was also operationally ineffective because most of the Americans involved had no more appreciation of the political and cultural realities of Vietnam than we did of Lebanon in 1983.**

Prospects for the Future

As the decade of the sixties ended and that of the seventies began, many observers believed that the United States would develop a comprehensive and prudent doctrine for psychological

operations. In fact, some thought, the government would have no choice but to do so. Some even thought there would be extensive research to determine the most efficient and effective methods of applying psychological techniques and weapons.

Alas, it was not to be! The United States is still without the requisite national doctrine. Worse yet, there is less acceptance of the legitimacy of psychological warfare as a tool of statecraft by the State Department and the USIA than was the case in 1970. There has been scant modification of the long-held view that the conduct of psychological operations is an exclusively military task-appropriate in war, but deplorable in peace. The recognition has not dawned that such activities are fundamental to effective counterinsurgency efforts and must be primarily conducted by non-DOD agencies.

There have been some modest advances under the current administration. In 1984, a landmark National Security Defense Directive (NSDD) established international communications as a major instrument of national security policy and assigned specific tasks to executive departments and agencies. Only one section dealt with psychological operations-and then solely in a military context. It directed the revitalization of the armed forces' capabilities to conduct such activities in support of military operations in crisis and in war. Typically, the NSDD did not establish any effective interagency mechanism for orchestrating and coordinating the various international communication capabilities.

Using the NSDD as leverage, the secretary of defense directed the preparation of a Psychological Operations Master Plan (which he subsequently approved in toto). Its purpose was to remedy the deficiencies that had developed since Vietnam-deficiencies in force structure, operational concepts, planning, research, training, intelligence support, personnel programs, and understanding the potential of psychological operations as a military force multiplier. The plan included these important actions:

1. JCS development of a comprehensive joint doctrine to cover employment to strengthen deterrence, in crisis and in war, as the foundation of the revitalization effort;

2. augmentation of planning capability on major combatant command staffs;

3. functional separation of special and psychological operations at staff and organizational levels, formally recognizing that the latter is inherent in all military activity across the spectrum of conflict;

4. reindoctrination of the officer corps through appropriate instruction within the mainstream service school systems and including psychological operations in training exercises;

5. modernization of equipment and force structure; and

6. most significant of all, the phased development of a Joint Psychological Operations Center as the font for doctrine and conceptualization, for the direction of research and analysis, for planning support of the unified and specified commanders, and for assistance to the secretary and the chairman in developing defense positions on national psychological plans and campaigns.

It will take much hard work and continued command prodding to see these initiatives through to fruition. Absent an institutionalized mechanism at the national level, the psychological dimension of contingency planning is handled on an ad hoc, fragmented basis. DOD has repeatedly urged the establishment of a national psychological operations committee, which would, inter alia, do detailed planning for the marshaling and orchestration of all government and quasi-government communication capabilities in support of military contingency plans or external crises short of direct military involvement.

It is understood that the concept of the committee has been approved in principle, but has not been activated due to the strong reservations of the USIA. Conceivably, the congressionally mandated Board for Low-Intensity Conflict at National Security Council (NSC) level will provide impetus for the interagency psychological operations structure as an essential adjunct for sound planning.

Meanwhile, one Army unit (the 4th PSYOP Group) strives valiantly to plug the national gap. It has produced excellent how-to-do-it plans for focusing all relevant national capabilities in support of several countries under threat. The professionalism

of the group is gaining recognition in key sections of the national security community. Both the group's planners and its colleagues on the ground can take much credit for the improvements that were wrought in the Salvadoran army.

Clearly, we are ill-prepared for the psychological dimension of the next major counterinsurgency that will engage the United States. The guidelines for enhancing performance are the major lessons gleaned from our past experience.

The first guideline--a truism meriting underscoring--is that the message communicated must be indigenous in content and in execution, leastwise within the confines of the supported country. The United States will have major tasks in ensuring political support for a beleaguered country on the international scene and here at home. In-country, the burden will fall on the shoulders of a few carefully chosen and highly qualified individuals who will operate in an advisory role, either formally or informally. The proportions of civilian and military advisors must be aligned to the structure of the host government; and while under the general supervision of the chiefs of the US Diplomatic Missions, they must work with and for their foreign colleagues.

Collectively, the US advisors must have a profound knowledge of the country--its culture, its customs, its political and social substructures, and the characteristics of its population. To ensure that depth of confidence, the group must be reinforced by--or be able to draw on the support of--the expertise of sociologists, clinical psychologists, and cultural anthropologists. They must, of course, be equally well informed about all aspects of the insurgency, its operating methodologies, its motivations, and its vulnerabilities. The challenge--a cross-cultural one--to those advisors will be to help the supported government shape and articulate value-based themes to which the population can relate. They must then ensure that all actions of the government and its personnel are consistent with--and reinforce--those themes.

A second, closely related guideline is to eliminate the mind-set that the practice of psychological warfare is the province of odd fellows steeped in the occult. To be sure, there are pressing requirements for full-time specialists and dedicated (albeit all-purpose) equipment. But these requirements deal

with only a portion of the psychological dimension in counter-insurgency: the detailed target research and analysis within both the native population and the insurgent structure; analysis of, and counters to, insurgent propaganda; and the offensive against the insurgents to confuse, confound, exacerbate vulnerabilities, and induce defections.

That sector aside, psychological operations (how badly we need other terminology) do not have a separate compartment. They may at times be a part of public affairs, civic action, troop information, civil affairs, public diplomacy, humanitarian aid, or political action. As exemplified by the campaign against the Huks in the 1950s, everyone can and should aid in the psychological enhancement of all programs to gain and maintain the allegiance and support of the target audience: the population itself. The sine qua non for attainment of that objective are concrete programs that are sound in design, sound in content, and professionally implemented.

The complementary-usually crucial-task is to multiply the impact of those programs and underscore the relevance of those programs to national aspirations. Completion of this task will require unceasing exploitation of every medium of communication, from ensuring the proper deportment of soldiers in face-to-face contact with villagers to sending traveling shows throughout the countryside to presenting sophisticated TV programs.

Conclusion

My advocacy of the extraordinary importance of the psychological dimension at any level of conflict notwithstanding, I am not sanguine about our government's capacity to exploit this nonintrinsic instrument of national power (or, indeed, even to comprehend its potential for enhancing national security).

Most worrisome is the failure to recognize-let alone take measures to counter-psychological and political warfare waged against our policies with the intent to undermine them; here, the cost of inaction is real and heavy. The stark fact is that the American public, the media, and even the bureaucracy, are generally oblivious to the scope and sophistication of this genre.

South Africa commanded center stage in Western consciousness because there was a spectacularly successful (and still ongoing) psychological warfare campaign. It was carefully orchestrated, replete with misinformation, and aided and abetted by our own gullible media. The Sandinista regime in Nicaragua had similar success. Thanks almost exclusively to the efficacy of its propaganda, there was more active support among the American public for the Sandinista regime than for the freedom fighters that our own government backed. Awareness that the integrity of our own political and decision-making base is under threat should lead to actions that would expose and neutralize our adversaries' efforts. Hopefully, such awareness will stimulate utilization of psychological and political warfare initiatives to further the positive goals of American foreign policy.

The Psychological Dimension of the Military Element of National Power

Maj James V. Keifer, USAF, Retired

War does not belong in the realm of arts and sciences; rather it is part of man's social existence.... Politics, moreover, is the womb in which war develops.

If war is part of policy, policy will determine its character. As policy becomes more ambitious and vigorous, so will war.

-Carl von Clausewitz

The six-month Persian Gulf War, popularly called the One-Hundred-Hour War, recently took us through the continuum of the policy process. Economic sanctions were applied by a world community united with a degree of resolve seldom seen; but because these actions take time, and time favored Saddam Hussein, they were never given the opportunity to prove their effectiveness. Through diplomacy, essentially a government-to-government process of negotiation and compromise, the political leaders of the world tried to defuse the situation. Because both sides held nonnegotiable positions, with no room for compromise, the prospects for a diplomatic solution were nonexistent. Diplomacy did, however, play an instrumental role in uniting coalition forces. Was a peaceful resolution out of the picture? It evidently was!

While the political and economic elements of national power played out their hands, two others came to the forefront. These were the military and the psychological elements. These two elements, working together, seemed to constitute our best opportunity for a peaceful resolution; and after failing to achieve a peaceful solution, these two elements worked together to enable us to win, win quickly, and win with the least possible bloodshed and destruction.

How could the military instrument offer a peaceful solution? By itself, not at all. However, with the psychological element ... ?

At the turn of the century, under Theodore Roosevelt's motto, Walk Softly and Carry a Big Stick, the United States practiced a policy called gunboat diplomacy. We built a reputation for "sending in the Marines" to achieve our national objectives. After a while, all we had to do was steam a ship to the coast; through intimidation, we achieved our objective.

Turning now to the recent Gulf conflict, we hoped to persuade Saddam Hussein to unconditionally withdraw from Kuwait through our military buildup in the Middle East. We felt that our recent excursions to Libya, Grenada, and Panama would certainly have impressed upon Saddam that we had the ability and resolve to settle the score militarily. And part of the psychological factor was Saddam's knowledge that his forces were equipped with hardware that was no match for our high-tech weapon systems. Another psychological factor was that, while Saddam didn't mind sending tens of thousands of Iraqis to martyrdom, he had no intention of becoming a martyr himself. The world community isolated Saddam and communicated unity on the issue through strategic psychological operations. Through theater PSYOP, we tried to convince him that it wasn't worth the cost to fight for a losing cause. Unfortunately, Saddam wasn't convinced; and neither were the Tikritis who supported him.

The psychological dimension played an important role in limiting the loss of lives and property. On the field of battle, we wanted to face an enemy who was unsure about his cause and capabilities but sure about his impending doom; an enemy who, even if unwilling to surrender, had little will to engage in combat. Through tactical PSYOP, we hoped to convey to the Iraqi military the futility of their position; we succeeded.

In the Middle East, the Andean Ridge, the Philippines, and throughout the world, the psychological dimension plays an important role in the achievement of national objectives. It serves the same purpose, and can be likened to, the aggressive marketing campaigns of Madison Avenue; that is, to affect the behavior of a target audience. Where Madison Avenue sells products and services, psychological operations sell ideas and ideology.

It's safe to say that all governments throughout the world make use of psychological tools during peacetime as well as during war. Activities are organized at two levels: international (we call these publicity, public diplomacy, and psychological operations) and in-country (we call these publicity, public relations, and public affairs).¹

The use of any and every element of national power carries with it psychological effects.² To this end Murray Dyer wrote, "the highest levels of government now recognize that in any decision on national policy there are psychological factors that must be taken into account."³ He cited the psychological dimension's cutting across departmental boundaries as the reason for an ongoing turf battle between the Department of Defense and the Department of State for control of the psychological instrument.⁴

The term *national power* describes the ability of a nation to influence other nations.⁵ Deterrence, a fundamental national security objective of the United States for years, is essentially a psychological phenomenon.⁶ Potential enemies perceive the cost of attack to be far greater than any possible gains. The assessment is based on the perception of this country's capabilities and resolve. Military psychological operations reinforce this perception by clarifying and repeating it. Edward N. Luttwak says it is an important message-one that must be communicated across the range of social and economic classes.⁷

Ronald D. McLaurin, author of *Military Propaganda: Psychological Warfare and Operations*, says that the reason for much of America's diplomacy and policy, both actions and words, is specifically to influence the behavior of other governments.⁸ Martin Wright distinguishes diplomacy from propaganda:

Diplomacy is the attempt to adjust conflicting interests by negotiation and compromise: propaganda is the attempt to sway the opinion that underlies and sustains the interests. Conversion therefore undercuts the task of compromise.⁹

How does the military element of national power support the psychological dimension? One fundamental foreign policy objective is to concentrate and optimize power. Other things equal, a nation that can back up its policies with coercive force holds a distinct advantage over less-capable nations. The

projection of power is a central concept of international relations. Luttwak states that power, the influence of one state over others, may be measured in terms of the perception of the audience. To be effective (powerful), perceptions are precisely what foreign policy must affect.¹⁰ The projection of US military power is often used as a force of political persuasion.¹¹ Such activities as port visits, bilateral exercises, firepower demonstrations, and special deployments help project power, as does the high-technology aura of US military hardware. Propaganda can be used effectively to reinforce and intensify these measures, but it must be carefully crafted to prevent counter-productive perceptions.

How, then, do psychological operations support strategic military objectives? The ability of nations to gather information, and to assess and interpret its relevance, isn't equal; what is perceived can be quite disparate from reality. With effects multiplied by differences in culture, experience, and expertise, the gap between perception and reality-misinterpretations-can lead to the misunderstanding of intentions, problems in resolving differences, and other dangerous situations.¹² Psychological operations bridge the gap.

If psychological operations are so important, why do they carry the stigma that seems to be attached? In the foreword to *Political Warfare and Psychological Operations: Rethinking the U.S. Approach*, Bradley C. Hosmer, president of the National Defense University, observed that "the negative connotations in the West of the word propaganda suggest we have treated political war as incompatible with democratic values and traditions." Frank R. Barnett, in the afterword to the same book, expressed also that "some would argue that the ethics of democracy preclude too strenuous a concern with propaganda." These statements unmasked American cultural bias toward the terms *propaganda* and *psychological operations*. Dr Carries Lord, in "The Psychological Dimension in National Strategy," also noted this phenomenon:

Manifest or latent in the attitudes of many Americans toward the practice of psychological-political warfare is a distaste for any sort of psychological manipulation or deception. The idea that psychological-political warfare is a black art that can be morally justified only under the most extreme circumstances is a derivative of

such attitudes. That such activities necessarily involve misrepresentation or deception is in any case far from the truth. But even assuming that some such element is inseparable from effective psychological-political operations, the moral calculus is by no means as clear as is frequently made out.¹³

The American attitude toward fair play reflects a disaffection for the use of any psychological manipulation. Gen Robert C. Kingston, commenting on "Political Strategies for Revolutionary War," by Richard H. Shultz, Jr., attributes this apprehension to past abuses of psychological tools by totalitarian regimes: "Many people in this country think that psychological operations equate to the Big Lie, suggestive of Goebbels and Hitler, and that we should not use it." ¹⁴ The late Gen Richard G. Stilwell, USA, Retired, provided comments on the institutional reluctance to consciously resort to perception for influencing activities. "The psychological weapon (and the political premises which govern its employment) have never been accepted as a permanent instrument of national security policy by the Executive Branch, the Congress, or the American people." ¹⁵ Cultural will, readiness, and the ability to conduct psychological operations have tended to surface only during wars. Ironically, it has been during wartime that the American public has become a primary target audience for national nonmilitary psychological operations.

Dr Lord credits the American media with helping to intensify cultural biases of the public through implications that underhanded objectives or purposes constitute the basis for such activities. He notes that claims of disinformation or public lies are often attached to media comments on psychological activities.

Dr Lord writes that the employment of psychological tools is further hampered by systemic weaknesses of the bureaucracy. From the top, he says, inadequate strategic planning and decision making prevent PSYOP from being considered, much less employed. The US diplomatic, military, and intelligence establishments distrust and resist any use of political-psychological warfare. Dr Lord charges that the State Department hasn't changed its diplomatic techniques in 200 years, ignoring the shrinking of the world brought about by dramatic advances in communications technology.¹⁶

The Department of Defense doesn't escape Dr Lord's criticism of institutional bias; he contends that, for reasons that are both similar to and different from those of State, military leaders have likewise tended to overlook the value of the psychological dimension, particularly outside tactical applications:

The military services, in their preoccupation with technology, major weapon systems, and the big war, tend to neglect low-cost approaches to enhancing operational effectiveness, especially at the lower end of the conflict spectrum; and they tend to regard political-psychological warfare as someone else's business. ¹⁷

Even the PSYOP community itself has struggled with its name for years, proposing such terms as *perception management*, *public diplomacy*, *political communication*, *influence operations*, and *international information*. In his article "By Any Other Name" in *Perspectives* (the magazine of the Psychological Operations Association), Col Thomas Taylor offered the title "Perception and Deception," suggesting the acronym, P&D.I ⁸ Lt Gen Michael Carnes, director of the Joint Staff, urged a name change in his address to the Psychological Operations Association at the 1989 Worldwide Psychological Operations Conference, commenting that "you can't call soap 'dirt' and expect it to sell."

This struggle for a new name begs a couple of questions. General Carnes's "soap/dirt" analogy is faulty. First, the term *psychological operations* is amoral and the community is not responsible for bias against it. It would be more to the point that people think of "earth" or "topsoil" in terms of *dirt*, *filth*, or *grime*. And second, terms considered more acceptable-*politically* and *popularly* fail to aptly describe the activity. A soldier in the battlefield making loudspeaker appeals to the enemy is not performing "political communications" or "international information."

Personally, I don't find the terms *psychological operations* or *propaganda* objectionable. What is needed is to market these words so that their pejorative connotations die out. Psychological operations help to save lives by using words, instead of bombs and bullets, to deter, or in the failure of deterrence, help win wars. In *The Weapon on the Wall*, Murray Dyer opines that the profession "is an honorable and important means, ranking with instruments of diplomacy, the military art, and

economic measures."19 One of his premises states that this discipline is a reflection of free will, a factor of public opinion. He's quick to point out, however, that this premise does not apply in a totalitarian state. Dyer says the way to overcome the institutionalized bias is through education. I agree: Education, coupled with advocacy, is the answer. The challenge is to encourage others to become disciples, too.

PSYOP in Desert Shield/ Desert Storm

Col Frank L. Goldstein, USAF
Col Daniel W. Jacobowitz, USAF, Retired

Understanding the role of psychological operations in the Gulf War requires more than a glimpse of its contributions to military conflicts. To understand PSYOP, we must place it within the context of the times; specifically, in the sequence of events that led to Operations *Desert Shield* and *Desert Storm*.

When Saddam Hussein began to build his military strength along the Kuwaiti border, the United Nations (UN) began to react. Through a series of 13 resolutions, the UN demanded that Iraq end its aggression and pull out of Kuwait. Embargoes were established and ultimatums were delivered. Member states, including the US, Egypt, United Kingdom, France, Italy, Saudi Arabia, and Kuwait, deployed forces and/or equipment. Virtually the entire Western world-and a majority of Arab nations-opposed Iraq. Americans at home overwhelmingly came to the support of the president's actions (in contrast to the domestic situation during the Vietnam conflict).' The US government clearly articulated its policies and goals, having developed them through full, rapid, public debate, involving the executive branch, the Congress, and even the judiciary, which rejected various legal challenges to the evolving policies.

A new force, the international electronic news media, became a critical element in the successful execution of the war. In particular, coverage by the Cable News Network (CNN) demonstrated the power of international broadcasting and involved itself as a medium both to aid and to deter Iraqi PSYOP plans. In true democratic media tradition, the accumulation of factual reporting allowed knowledgeable audiences to correctly characterize Saddam's plans and behavior.

The Iraqi propaganda system is pyramidal, with the top spot occupied by Saddam Hussein. Control is maintained at the

top, with many outlets, both overt and covert, at the bottom. Iraqi propaganda flows from the Ministry of Culture and Information (MCI) under the strict supervision of the Baath Party, the Revolutionary Command Council (RCC), and Saddam Hussein. Iraq's propaganda system was closely modeled after the Soviet system and is similar to that of most other totalitarian states.

An overriding aspect of Iraqi propaganda is the use of religious words and phrases. The techniques of Iraqi propaganda during the course of the crisis reflected the same style used by the Iraqis before the Gulf War. This campaign emphasized religious symbolism, Arab nationalism, and praise of Saddam Hussein. These themes reflected Iraqi culture and politics, demonstrating the fallacy of planning PSYOP based on the characteristics of the sender (rather than the nature of the receiver).

The Iraqis selected the following four objectives for their initial PSYOP campaign:

1. Rationalize their invasion of Kuwait.
2. Gain support of Arab masses.
3. Discourage nations from participating in the UN embargo.
4. Discourage or hinder military attacks on Iraq.

Four themes were generated from these objectives:

- a. The revolutionary forces in Kuwait had asked for Iraqi help.
- b. Iraq is the champion of oppressed Arabs.
- c. The West is depriving the Iraqi people of food and medicine.
- d. Iraq will withdraw from Kuwait after a short time. 2

Later, a fifth objective-rationalizing the incorporation of Kuwait as a permanent province of Iraq-was established.

The MCI distributed the themes to the various media outlets for dissemination. This system worked very well, enabling the MCI/Baath Party to coordinate the campaigns, to react to impact indicators of current campaigns, and to initiate new campaigns on short notice. Some of the campaigns were selectively distributed to increase the stress impact on the target. Other

campaigns used all media to ensure the widest possible distribution in the shortest amount of time.

Few limitations were placed on the type or content of Iraqi propaganda. At no time did missing or contrary facts interfere with Iraqi operations. If needed, documentation was simply manufactured. In the Iraqi PSYOP system, few restrictions are placed on efforts used to further an Iraqi goal. Furthermore, their campaigns did not have to follow any consistency, logic, or form; it was acceptable to criticize the Multinational Force's (MNF) bombing as being inaccurate on one day and, on the next day, to rest a theme on the destruction wrought by highly accurate MNF bombing. As far as Iraqi media were concerned, MNF bombing accuracy varied with the need to enhance the Iraqi propaganda campaign.

Saddam's use of PSYOP had varying results. Saddam used Scud attacks on Israel and Saudi Arabia as a political weapon to divert coalition attention and military effort from the main battlefield. The ever-present threat of chemical warheads was a major factor in his plan. According to Lt Gen Tom Kelly, operations chief for the Joint Chiefs of Staff, the Scuds were "of little military significance." Nevertheless, they produced emotional and psychological effects. Although Saddam induced fear among the Israelis and Saudis, and consternation among the coalition in general, his plan ultimately grounded on the rocks of military reality. However, Saddam's combination of useless military technology and a politically diverse targeting policy did serve to divert valuable coalition resources from other targets to the difficult task of Scud hunting.

Saddam's tactical purpose was achieved, but his strategic purpose was thwarted by dual coalition responses. Coalition tactical air efforts against the Scuds helped the Israelis maintain their policy of restraint, while the technological breakthrough of Patriot missiles calmed both Israeli and Saudi publics and further demonstrated coalition invincibility. Tactical military response, based on military competence and technological superiority, blunted a political weapon aimed at the heart of the coalition.

Iraqi efforts to use Western television as a relay for propaganda programs failed to convince important world audiences, although they may have been somewhat effective within the

Arab world. Among those efforts were Saddam's personal appearances with hostages, whom he attempted to characterize as "guests" of the Republic of Iraq. But Saddam's campaign was doomed by the perfectly natural and spontaneous negative reaction of a little British boy whom Saddam tried to convince of his good will. In this case the attempt to manipulate Western media completely backfired, as repetition of this scene throughout the Western world established public opinion of the true nature of the hostage situation. Further, it exposed Saddam's manipulative efforts and seriously eroded whatever credibility he retained.

Later Iraqi broadcasts were to fall flat as a result of Saddam's loss of credibility. For example, scenes of bomb damage at the otherwise unidentified building presented by the Iraqis as the Baby Milk Factory (with signs and workers' jacket logos conveniently in English) were quickly dismissed as crude propaganda by all except the most gullible or anti-Western. The nonsequitur of the signs and the behavior of the Iraqi media escort personnel (who limited reporter access within the site) conflicted with Iraqi claims. And when Western intelligence analysts demonstrated that the claimed bombing damage to cultural facilities in Iraq (the bombing of which is forbidden by the accepted laws of war) had in fact been faked by Iraqi wrecking crews, the remaining shreds of Iraqi television propaganda credibility were destroyed.³

Controversy still rages, particularly within the TV news industry, on the wisdom of continuing censored and pressured TV broadcasts from within the enemy capital. The TV broadcasts had both positive and negative tactical effects. Coalition operators were able to conclude from viewing scenes from Baghdad, or from the disappearance of live TV from Baghdad, that certain targets had been effectively struck.

In addition, the televised appearance of downed coalition pilots proved counterproductive for Iraq's objectives. Instead of convincing the coalition partners to acquiesce, a worldwide audience was appalled by the battered physical condition of the captives-and their orchestrated, mechanical admissions of guilt were painfully transparent. A backlash effect inspired greater support for the coalition.

A closer look at this one aborted Iraqi campaign will help clarify the propaganda process. The Iraqi goal of this propaganda campaign was to break the coalition. The Iraqi leadership concluded that if US public opinion could be marshaled against the war in the same way it was during the Vietnam conflict, the US would withdraw. Toward that end, the propagandists attempted to mimic some of the successful tactics used by the government of North Vietnam. One of the tactics employed was on-camera interviews of captured coalition pilots. The Iraqis thought that presenting these interviews would stimulate the US public to call for the withdrawal of US forces and the pursuit of peaceful options. Instead, outrage at Iraq's obvious violation of the Geneva convention resulted in even greater backlash against Saddam.

The highest echelons of the MCI/Baath Party made the decision to use captured allied pilots for propaganda purposes. The Iraqi News Agency, one of the principal media outlets to the West, managed the entire campaign. The plan to exploit allied pilots for propaganda included this strategy:

- capture several pilots,
- parade them through the streets,
- put them on television with prepared questions and answers,
- view the impact of the broadcasts through the Western media, and
- disseminate broadcasts to media and determine their impact.⁴

The initial problem that Iraq faced was how to disseminate their product; the coalition had damaged most of Iraq's television broadcasting capability early in the conflict. The Iraqis were forced to use a surviving low-power television transmitter, which they used to televise the parade of coalition pilots through the streets of Baghdad. But Iran was the only country that could receive their transmissions, and the Iranians did not share them with the world in a manner that suited the Iraqi purpose.

To circumvent this problem, the Iraqis videotaped interviews of the pilots and delivered them to various Western news

agencies. The interviews of the pilots were choreographed with specific questions and answers.

Interviewer: What's your opinion of this aggression against Iraq?

Pilot: I think this war is crazy and should never have happened. I condemn this aggression against peaceful Iraq.

Interviewer: What do you think about this aggression against Iraq?

Pilot: I think our leaders and our people have wrongly attacked the peaceful people of Iraq. 5

In the interviews the pilots told their families that they were being treated well. The MCI/Baath previewed and approved the interviews before releasing them to the media.

The response to the broadcast came very swiftly. All Western government, public, and media severely condemned the broadcasts and use of the downed pilots in this manner. The worldwide condemnation was so overwhelming that the broadcasts, which had begun on 20 January, ended on 24 January. On 25 January, the MCI announced that the interviews of captured pilots would stop.

Another of Saddam's PSYOP efforts were the radio broadcasts to US troops in the field by "Baghdad Betty," reminiscent of those by Tokyo Rose during World War II. Intended to lower US troop morale, Betty's messages veered into the farcical as she warned American servicemen that their wives back home were sleeping with famous movie stars like Tom Cruise, Arnold Schwarzenegger, and Bart Simpson.

PSYOP, as used by Iraq, was intended to produce the greatest amount of negative stress within the coalition forces, the civilian population of those governments, and upon the civilian and political leadership of surrounding Arab states. As previously stated, the PSYOP efforts against the military forces of the coalition had minimal effects. However, the PSYOP effort aimed by Iraq at certain segments of the coalition countries and surrounding Arab nations was notable.

Saddam's propaganda effort as a stress-inducing instrument appears to have been as intense as the effort put forth by North Vietnam during the latter part of the Vietnam War. The

Iraqi PSYOP effort was clearly intended to pressure those nations supporting the coalition and those UN resolutions imposed on Iraq. Another Iraqi effort was to gather support for economic sanctions as an alternative to military action. Later, efforts were made against economic sanctions. Iraq portrayed the US, and specifically President George H. Bush, as the main opponent to Saddam. Some of the key themes used in these campaigns:

- **The war was really about access to oil.**
- **The US was using the war as an excuse for imperialism.**
- **The US was propping up a corrupt government in Kuwait.**

These attacks, targeted at the populations of Great Britain, Germany, France, Australia, Canada, the United States, and the Arab nations of the coalition, had varying degrees of success.

The Iraqi campaign against imperialism was a carbon copy of earlier Vietnam-era themes. Saddam spoke of the Gulf crisis as another Vietnam and painted a portrait of the US and coalition partners as embarking on another mistake. A great deal of effort was put into the following propaganda themes:

- **The US was embarking on another dirty war.**
- **The war would be very bloody and would last a long time.**
- **The US would again be divided over the war.**
- **Again, the poor and the minorities are fighting a war for the rich and powerful.**

Saddam Hussein's speeches were filled with images of certain doom, Vietnam-style-body bags returning home by the thousands, an enemy who could wait out the bombing to fight a bloody ground war, and an environment that would be as inhospitable as the jungle. He expected average citizens to recoil from the horror of such a war and spread more propaganda to dissuade the voters from supporting the coalition effort. A wedge between the Western nations would, in his mind, eventually result. The strategy is reflected in media writing around the world.

Iraq is no Panama and Saddam Hussein no General Noriega... The United States might be mired in the sands of the Arabian deserts just as they were bogged down in the paddy fields of Vietnam. (New Straits Times, 13 August 1990.)

It was clear from the beginning that the Persian Gulf conflict would not only be resolved in the hot dunes of the desert, but also in the

quicksand of US public opinion.... While the public's reaction against the US involvement in Vietnam took years to materialize, it has developed very quickly [for the Middle East] . . . This is a fortunate development. (*La Jornada*, 22 October 1990.)

[Saddam] seeks to break Western solidarity and above all to put the Bush Administration in a corner. Time is in favor of Iraq now that US public opinion is gaining a clearer dimension of the high cost in human life of military action in faraway lands. (*La Nacion*, 22 August 1990.)

The military force building up against Saddam Hussein is such that a spark may be struck at any moment. The United States will be in danger of sinking into the sand, as it once did in the rice paddies of Vietnam. (*La Suisse*, 23 August 1990.)

There's the strongly-held belief that the [Vietnam] experience has rendered America incapable of marshalling public support to launch another war. (*Irish Independent*, 20 September 1990.)

While the Iraq propaganda effort certainly caused some confusion, and increased the stress of susceptible segments of the audience, neither public opinion nor the world media were moved as the Iraqi president had hoped. The public within the US and other coalition countries was determined to show support for their soldiers stationed in the Gulf. Neither slogans nor disrespect of military forces gained popularity during the war.

The failure of most Iraqi propaganda was in its credibility. While Saddam himself believed much of his propaganda, it appears that most of the world did not. His biggest successes were in the Arab world; and even in those countries, success was neither significant nor complete on any issue. The propaganda, in general, was far below the level of sophistication of effective audiences. Politically aware segments of the population, who would be inclined to be antiwar in general, were, if anything, turned off by the crude Iraqi attempts to manipulate their sincere beliefs. The clear articulation of goals, international support through the coalition and the UN, and the effective, low-casualty military action, rendered Iraqi propaganda ineffective.

Coalition Psychological Operations

In contrast to Saddam's efforts, coalition PSYOP efforts significantly affected Iraqi soldiers. First, the coalition efforts

were of a more tactical nature (i.e., focused on *convincing* Iraqi troops to surrender). Second, the combining of PSYOP with the air and ground campaigns was intended to affect both soldiers and senior military leadership.

Tactical PSYOP in the Persian Gulf proved effective and efficient in terms of four principal sets of operations: ⁷

- radio *transmissions*,
- loudspeaker broadcasts,
- leaflet *disseminations*, and
- enemy prisoners of war (EPW) team actions.

Operational success resulted from effective innovation in the field and from well-executed, time-sensitive planning. To a lesser extent, tactical operations proceeded from the deliberate planning model. Using the four identifiable sets of operations, PSYOP was implemented by various agents and organizations, ranging from theater-level cells to small, three-person teams serving in direct support of the forward combat units.⁸

The four operations showed different levels of effectiveness as to their impact on the Iraqi target audience. Table 1 lists the efforts and the relative effectiveness resulting from the four operations collectively.

Table 1

Exhibit I PSYOP Effort and Relative Effectiveness
in the Persian Gulf

----- Effort -----

29 Million Leaflets Dropped In-theater
17 Hours Per Day of Radio Transmitting
19.5 Hours Per Day Aerial Broadcasting

----- Relative Effectiveness -----

73 Thousand Iraqis Reached through PSYOP
70% EPWs Report Messages Had Impact on Surrenders

Source: United States Special Operations Command (USSOCOM), "Post Operational Analysis: Iraqi Psychological Operations During Operations DESERT SHIELD/STORM," SOJ9, 1992.

The four operations focused on the intended Iraqi audience in concert with effective air and ground campaigns. However, because PSYOP had been slighted in the theater operational plan, this combination was not used at first. The result of this combined PSYOP, air, and ground effort was the influencing of an unexpectedly large number of Iraqi prisoners to surrender.

The four sets of operations-radio transmission, loudspeaker broadcasts, leaflet drops, and the actions taken by EPW teams-were conducted in January and February 1991.⁹ The coalition initiated its tactical leaflet and radio activities in January 1991 to coincide with the start of the air campaign and terminated them in March and May, respectively. The loudspeaker and EPW actions began in February with the start of the groufid campaign and ended in March and April.

An important precept at work in the radio and leaflet operations was reinforcement. Tactical PSYOP personnel announced to Iraqi ground units that a bombing was to occur at a specified time and place.¹⁰ The next day, they announced that a bombing had indeed occurred as warned (only if the event had occurred as planned). The repeated cycles of announcement and execution helped persuade the Iraqis that the message and delivery means were credible and that surrender was a viable alternative to useless death.¹¹

Radio Transmissions

Six broadcast platforms were established and used in the Persian Gulf theater of operations. Three were Volant Solo using EC-130 aircraft platforms (retransmissions made via modified USAF C-130 aircraft) and three were ground radio stations: "Voice of the Gulf," "Voice of America" (DOD-loaned equipment), and "Free Kuwaiti People." According to now declassified message sources, the radio stations were managed and run almost exclusively by US Central Command (USCENTCOM) as part of its theater operational plan. Thus, these stations were integrated into the overall combat-PSYOP effort relatively early. Programs consisted of pretaped messages broadcast continuously each day for about 17 hours. Messages conveyed such themes as the inevitability of defeat, Saddam's inappropriate leadership, and surrender

appeals. A typical message transmitted over an established "surrender hotline": "YOUR DIVISION WILL BE BOMBED TOMORROW. ABANDON YOUR EQUIPMENT, LEAVE YOUR LOCATION NOW, AND SAVE YOURSELVES."

The relative effectiveness of these radio transmissions, in terms of audience exposure, was approximately 58 percent (versus zero for no transmissions). The degree of persuasiveness relative to no transmissions was estimated to be 46 percent. Impact on surrender reached about 34 percent.¹²

Such moderate values, according to some thinking, may be reflective of a culture whose primary representational systems (or language channels) seemed not to be auditory, but visual (as with leaflet drops) and kinesthetic (as with the humane actions of EPW teams).¹³

Loudspeaker Broadcasts

Typical PSYOP was accomplished in the theater of operations by two- or three-person loudspeaker teams in direct support of forward combat brigades. Teams consisted typically of one or two noncommissioned officers and an interpreter or communications specialist.

Loudspeaker teams broadcast messages that had been prepared and dubbed onto audiotapes and distributed to them and other teams by the 4th PSYOP Group by way of its product dissemination battalion. Occasionally, a team would ad-lib a broadcast if pressures of the moment demanded variation from the prepared script and if the language skill and initiative of the team so permitted.

Loudspeaker broadcasts generally produced moderate effectiveness in terms of audience exposure, persuasiveness, and impact on surrender. The rather uneven successes of the loudspeaker operations were found to be similar to those of radio transmissions, although some results, arguably positive, were obtained through the convincing appeals of enterprising loudspeaker teams. At least one team induced a captured Iraqi sergeant to make heartfelt appeals to his comrades across a berm using the very loudspeaker system that induced him to surrender.¹⁴ Feedback from some EPWs indicated that, while

"leaflets and radio showed us how to surrender, loudspeaker teams told us [exactly] where [to do it]. ^ 15

The following account by SSgt Edward Fivel, 9th Battalion, 4th Psychological Operations Group (POG), illustrates the operation of his loudspeaker team and its unusual effectiveness.

We had to convince the company commander of our parent unit to let us PSYOP people try ousting those Iraqi soldiers from their underground bunker. We kept telling him there was nothing to lose by trying, especially since the pounding all morning by the 101st [Airborne Division] hadn't done anything.

So the three of us gave it a try. We arranged for the Blackhawk [helicopter] to ride us to the site of the bunker and we began dropping surrender leaflets. Then we returned to base and found that nothing had happened-no surrenders, no movement, nothing.

We tried something else. We hopped back on the Blackhawk and returned to the bunker area, this time intending to use our loudspeaker system and a pretaped message given by headquarters. We picked a spot on the ground about 800 meters from the bunker and started broadcasting. Nothing happened. I guess we couldn't be heard over the loud racket of our helicopter.

We asked the pilot to land us on the ground not too far from the bunker. With what you might call serious reservations, he eventually landed us, feeling a little protected, I guess, by the three Apaches and one Blackhawk whopping above our heads and to our right. He took off immediately, saying he'd stay in contact by radio.

The three of us were now on the ground. We were facing this enemy bunker that Intelligence says has 20 enemy soldiers who might be waiting to greet us. We picked up our loudspeaker equipment-the transmitter and the speaker-and ran about 200 meters closer to the bunker. We sat the equipment down and again started playing the cassette surrender tapes. Still no movement.

Then our team leader decided to lift up the speaker. He lifted it and began carrying it even closer to the bunker. He toted that speaker exactly 50 more meters. I knew the distance because that's the length of the electrical cord he stretched out to the end, 50 meters. The team leader was very close to the enemy now.

Then he suddenly stood straight up and pushed the speaker high over his head [like some kind of statue showing a big trophy to a crowd far away]. I told the other guy back with me watching all this, our communications man, to quit playing the taped message and go live, and to keep doing it. The guy had just gotten out of language school, so he could handle the Iraq language pretty well. He talked loudly through the speaker in four message sets.

That worked. A crackling voice came through our radio from the helicopter pilot who was still hanging up there with us. The pilot had spotted some movement. Then we saw Iraq soldiers begin climbing out of the bunker in front of our team leader. They were waving little white flags and carrying no weapons.

That was about it for us in that scene because our pilot said over the radio that he was landing to pick us up so he could refuel back at 101 division base. He was running real low on fuel. We didn't see how many Iraqis came out of that bunker, although we had counted up to about 20 of them before we took off.

When we got back to base, the three of us and our pilot began receiving weird congratulations. We weren't sure why. Seems that over 400 Iraqis eventually came out of the bunker, all without a fight.

For the next couple of days every helicopter the 101 had was flying back and forth carrying Iraqi soldiers from the bunker to a forward EPW camp. The camp must have been getting pretty crowded. The big thing we realized later was that these actions had kicked off the "Hail Mary" play in the ground war because they fixed the Iraqi units on line in front of us, letting our endrunners in the other division make their wide sweep around the main Iraqi force.

Leaflet Drops

Leaflets and other forms of print PSYOP proved especially effective. Of the targeted audience-300,000-plus Iraqi troops-approximately 98 percent of them read or were otherwise exposed to the 29 million leaflets dropped in the theater.¹⁶ Many EPWs were found clutching leaflets in their hands or hiding them somewhere on their uniforms as they raised their arms to surrender.¹⁷ An estimated 88 percent of the Iraqi forces were influenced by the leaflet drops as intended, and 77 percent were persuaded to quit the fight through the combination of combat-leaflet operations and credible tactical military threats and actions.¹⁸

Leaflets appeared to be effective in the Persian Gulf crisis. Their language was simple and straightforward. Appeals were visual for an audience that seemed to respond psychologically and emotionally to visual means. Whether the leaflets' effectiveness stemmed from psychological reasons or simply from the sheer volume of leaflets that descended on the Iraqis daily is open to interpretation. Weather conditions and low leaflet loss, combined with a generally effective theme, audience

vulnerabilities, and effective coalition military action, resulted in an unprecedented success in inducing surrenders. The leaflets enabled many Iraqi soldiers, who were not highly motivated to support Saddam's war of conquest, to avoid sacrificing their lives in a doomed cause.

Still, some curious effects were attributed to at least some of the leaflet designs. These were effects that startled even the Arab partners who had supposedly provided input to the format.¹⁹ PSYOP personnel later learned that the leaflets' effectiveness would likely have been enhanced had design consideration been given to the nonverbal, cultural cues that were read by the Iraqis as subtext.²⁰

If this concept (subtext in language) escaped or seemed vague to designers and others at first, the application certainly became clear with each EPW whom they later interviewed during *Desert Storm* and similar situations.²¹ Theater PSYOP personnel came to realize that they had missed an important dimension of cultural communication when designing the leaflets. In some cases, the PSYOP personnel were able to make adjustments and manage reprints; in others, they learned the cultural lessons after the cessation of hostilities.

An important illustration of this concept was the subtextual message transmitted by the color red. When red ink was included in leaflets, presumably for function or appeal, Iraqi soldiers typically hesitated or avoided approaching a leaflet sticking out from the sand nearby. They simply feared and disdained red as a signal for danger.²²

Whenever Iraqis read a leaflet that showed a coalition soldier without a chin beard gesturing affably to an Iraqi, the reader became distrustful. To an Iraqi a chin beard signals a certain Muslim holiness and trust he could not find on a clean-shaven chin.²³

When the Iraqis scrutinized a leaflet that showed Iraqi EPWs enjoying a bowl of fruit given by their captor, they were disappointed at seeing no bananas in the bowl. Bananas are a favored delicacy in Iraqi culture.

When an Iraqi soldier saw words encircled in the familiar thought bubble of Western comic strips, he became thoroughly confused. Unlike the English-speaking world and some other cultures, Iraqi culture does not link bubbles, words, and

pictures.²⁴ However, this technique had been so internalized by the leaflet designers, that they were unaware that some cultures use other clues to indicate which cartoon character is speaking.

Overall, *PSYOP in Desert Storm* was among the most successful media-based PSYOP campaigns ever undertaken. Planners incorporated PSYOP into air operations from the outset and relied on leaflets to multiply the stress induced by unopposed bombing raids. *Desert Storm* coalition PSYOP proved the value of this combat adjunct at the tactical level and reaffirmed the overriding importance of credibility. Iraqi disdain for truthfulness contrasted vividly with Western punctiliousness in behavior and leaflet preparation. Coalition determination to stick to truthful overt PSYOP, relying on credible military performance to override minor cultural missteps in message preparation, proved successful in inducing thousands of early surrenders. The bottom line of coalition policy was met-casualties were reduced on both sides.

3. The US is not signatory to the 1954 Hague cultural property convention, but the US Army integrated the treaty interdictions in 1955. W. Hays Parks, fn 212, 60.
4. USSOCOM.
5. Ibid.
6. Such use of prisoners is forbidden by the laws of warfare. The failure of the Iraqi plan was partially engineered by such clever Yankee air pirates as Lt Jeffrey Zaun, who adapted the methods used by US airmen and sailors in the Vietnam War. Zaun augmented the battering of his face and exaggerated his inappropriate behavior to inform the world the Iraqis were maltreating him. What is more amazing is that the Iraqis would peddle these devastating tapes. The coalition pilot's actions were so effective that future conflicts may finally see the end of such illegal exploitation of prisoners.

Epilogue

Lt Gen Samuel V. Wilson, USA, Retired

If past events are indeed prologue to the future, then understanding the early nature and scope of psychological operations, synthesizing the PSYOP lessons learned from historical national *policy* planning and from strategic, tactical, and operational PSYOP applications, can foreshadow even greater progress and success in accomplishing our national interests and objectives in political and military environments. *Psychological Operations: Principles and Case Studies* is the catalytic framework toward that end, since it reflects the foundation of PSYOP knowledge and wisdom.

It is critical that those involved with PSYOP—whether they are military commanders, political leaders, new PSYOP technicians, or experienced PSYOP practitioners and staff officers—become familiar with this book to better understand the importance that military PSYOP plays as a cost-effective, force-multiplier instrument of US military and political power. Such understanding is especially necessary today, given our military budgetary constraints, the existing nuclear, biological, and chemical threats, and our dynamic, complex, and worldwide arena of operations. Sun Tzu's strategy in 500 B.C. of subduing the enemy without engaging him is not only apropos but quite probably necessary for our very propagation.

The reader can learn much from parts II and III, which present various articles on national policy, PSYOP planning, and strategic and tactical PSYOP. Part III is especially significant since today much of the third world still uses Soviet PSYOP doctrine. In fact, those who would argue that the communist ideological threat has diminished with the demise of the Soviet Union, and that the US PSYOP focus should be abated, need to take heed of the various strategic and global resurgencies and the Vietnam legacy presented in part IV. One of the most important reasons for the communist "ideo-military"

victory in Vietnam, for example, was that American strategic PSYOP had no political or moral acceptance as a necessary foundation of our national policy. We should not minimize the urgent need to increase American sensitivity to the psychological dimension of warfare, and these articles and case studies support that theme. The articles on our recent actions in Panama and in *Desert Storm* not only solidify the PSYOP requirement but also point out our weaknesses and future challenges.

These authors lead us to believe correctly that the PSYOP weapon system, if employed properly, must precede, accompany, and follow all military force employments while being closely coordinated with all agencies of government and while being systematically integrated with US national security policy and objectives throughout the spectrum of conflict and in peacetime. PSYOP is indeed a phenomenon in itself.

Contributors

Preston S. Abbott

George V. Allen, retired career foreign service officer, has served as ambassador to Iran, Yugoslavia, India, and Nepal, and as Greece's assistant secretary of state for Near East, South Asia, and African Affairs. Other positions he has held include director, US Information Agency; president, Tobacco Institute; and director, Foreign Service Institute.

MSgt Richard A. Blair, USAFR, a military intelligence analyst in the Reserve, is staff assistant to the senior military liaison and defense advisor, United States Information Agency, Washington, D.C. He was recalled to active duty during the Persian Gulf War to provide ongoing analysis of Iraqi psychological operations for Headquarters US Special Operations Command.

DeWitt S. Copp served as an Army Air Force Air Transport Command pilot in North Africa and the Middle East in World War II. Since the war, he has specialized as a book, film, and news writer in military aviation and foreign affairs. Copp has served on the staff of "Voice of America" as a writer-editor and with the United States Information Agency as policy officer on Soviet disinformation.

Col Benjamin F. Findley, Jr., USAFR, is a politico-military affairs officer with the Directorate of Psychological Operations and Civil Affairs, J-9, Headquarters US Special Operations Command. He holds a PhD degree in business. Colonel Findley has been a regular speaker at the USAF Special Operations School and a guest instructor at the Air University Center for Professional Development. He previously won the PSYOP Outstanding Instructor's Award and was the outstanding USAF Academy liaison officer for the Alabama-Northwest Florida

Region. Colonel Findley is a graduate of Air War College and is the author of several books.

Lloyd A. Free, president, Institute for International Social Research, School of Advanced International Studies, Johns Hopkins University. His former positions include editor, *Public Opinion Quarterly*; director, Foreign Broadcast Intelligence Service, during World War II; assistant military attache, Switzerland; acting director, Office of International Information, State Department; advisor to Presidents Eisenhower, Kennedy, and Johnson; and advisor/consultant to Vice President Nelson Rockefeller.

Col Frank L. Goldstein, USAF, is dean, Education and Research, Air Command and Staff College, Air University. Formerly he served as deputy chief, Policy and Concepts Division, Directorate of Psychological Operations and Civil Affairs, J-9, Headquarters US Special Operations Command and as chief, Psychological Operations Branch, at the USAF Special Operations School. Colonel Goldstein earned a PhD degree in educational psychology and is a graduate of the USAF, British, NATO, and German PSYOP courses. He is a well-known writer and speaker among military audiences.

Col Joseph S. Gordon, USAR, professor of European studies at the Defense Intelligence College. He has taught history at Campbell College and at Duke University, where he earned a PhD degree in European history. Colonel Gordon's interest in psychological operations derived from three years as an intelligence analyst with the 4th Psychological Operations Group, Fort Bragg, North Carolina. He is a graduate of Army War College.

Col Daniel W. Jacobowitz, USAF, Retired, is assigned to strategic missile operations and the political-military field at Air University. Following his Titan II missile assignment, he had consecutive tours in Military Civic Action in Thailand. Colonel Jacobowitz has previously been on the faculties at Squadron Officer School and Air Command and Staff College and was operations officer of the Psychological Operations

Division, Combined Forces Command, Korea. After a tour in the State Department, he served as director of Psychological Operations in the Office of the Secretary of Defense and as director of the Center for Treaty Implementation, US Southern Command, Panama. He joined the Gulf War Air Power Survey team in 1991.

William F. Johnston is a member of the staff and faculty, National Interdepartmental Seminar, in the Office of the Chief of Psychological Warfare at the Foreign Service Institute. He has had several special warfare-type assignments, including command of a psychological warfare (psywar) battalion in US Army, Pacific. ~Johnston is a former chief of the Joint United States Public Affairs Planning Office, Vietnam.

Lt Col Philip P. Katz, USA, Retired, is a senior research scientist, American Institute for Research. He has been a psychological operations (PSYOP) instructor and lecturer at the Army Special Warfare Center, a PSYOP officer at the Department of Army, senior PSYOP officer for US Army, Pacific, and senior program manager for Development of Strategic Psychological Operations in Support of Field Activities, Vietnam. Colonel Katz developed a computerized PSYOP management information system for the Joint Chiefs of Staff and the Department of the Army. He is the author of several studies on psychological operations.

Maj James V. Keifer, USAF, Retired, is a psychological operations staff officer in the Directorate of Psychological Operations and Civil Affairs, J-9, Headquarters US Special Operations Command. He earned his master's degree in public administration from the University of Oklahoma and is a graduate of PSYOP courses instructed by the US Air Force and Army, the British army, and the North Atlantic Treaty Organization. Major Keifer's career has included experience in space operations, audiovisual media production and management, and public affairs.

Dr Carnes Lord earned PhD degrees from both Yale and Cornell Universities. He has been a distinguished fellow at the

National Defense University, an assistant to the vice president for National Security Affairs, and a foreign affairs officer with the Arms Control and Disarmament Agency. He has had consultant and director positions at the National Security Council and at the National Institute for Public Policy. Dr Lord's assignments at universities and colleges have been as assistant professor in the Department of Government and Foreign Affairs at the University of Virginia, instructor in the Department of Government at Dartmouth College, and lecturer in the Departments of Classics and Political Science at Yale University.

Ronald D., McLaurin is a research scientist, American Institute for Research. His previous positions include assistant for Africa, Office of the Assistant Secretary of Defense (International Security Affairs) and management assistant, Office of the Secretary of Defense. McLaurin is the author and contributor to studies on the analysis of foreign policy, international politics, and social and international conflict.

James Melnich is an analyst, Soviet Internal Affairs, Defense Intelligence Agency. He holds an MA degree from Harvard University. Melnich formerly served as director, Russian Émigré Center in Chicago.

Michael A. Morris is a fellow at the Canadian Institute of International Affairs. He formerly served on the faculty at Gallaudet University.

Laurence J. Orzell served as European branch chief, 6th Psychological Operations Battalion, 1st Special Operations Command, Fort Bragg, North Carolina. He taught European and American history at Marywood College and the University of Scranton. Orzell's publications on Polish history and immigrants have appeared in *Polish Review*, *Mid America*, and *Polish American Studies*.

Lt Col John Ozaki, USA, is a career military officer assigned to the Department of Army. He has served with the Army Security Agency, Headquarters 7th Army, Military Assistance Command, Vietnam, and in the infantry in Korea. Colonel

Ozaki is a graduate of Army Command and General Staff College.

Col Alfred H. Paddock, Jr., USA, Retired, served three combat tours with Special Forces units in Southeast Asia and held positions on the faculties of Army Command and General Staff College and Army War College. Other assignments include the Department of the Army Staff and the Secretary's Policy Planning Staff, Department of State. Colonel Paddock was commander of both the 6th Psychological Operations Battalion and the 4th Psychological Operations Group, and was director for Psychological Operations, Office of the Secretary of Defense. He earned his MA and PhD degrees from Duke University and is author of U.S. Army Special Warfare: Its Origins.

Gen Richard G. Stilwell (1917-91), USA, Retired, served in a number of key military and civilian positions throughout his professional life. He was commandant of cadets at the US Military Academy, commander of the 1st Armored Division and the 24th Army Corps, Vietnam, and chief of staff for General Westmoreland. As a civilian, the late General Stilwell served as under secretary of defense for policy and chairman of the DOD Security Review Commission.

Col Fred W. Walker (1942-90), USAF, Retired, was the first chief of the Psychological Operations Directorate, J-9, United States Special Operations Command. The late Colonel Walker was a pilot, parachutist, and past chief, PSYOP Division, Organization of the Joint Chiefs of Staff, Washington, D.C. An author and speaker on special operations throughout DOD, he was a graduate of the Armed Forces Staff College, Air War College, and the US Air Force Academy.

Col Dennis P. Walko, USA, master parachutist and licensed professional engineer, is chief of the Command Support and Coordination Division, Directorate of Psychological Operations and Civil Affairs, J-9, Headquarters US Special Operations Command. He has served in the Civil Affairs-PSYOP Exchange Office to the Colombian Army General Staff, as civic action

coordinator to the El Salvador Combined General Staff, and as commander of the 1st Psychological Operations Battalion. Colonel Walko is a graduate of Command and General Staff College and the Inter-American Defense College.

Lt Gen Samuel V. Wilson, USA, Retired, is president, Blackburn College, Carlinville, Illinois. Before his retirement in August 1977, he had served in combat during World War II with the Office of Strategic Services, in the 1944 North Burma Campaign with "Merrill's Marauders," with the US Defense Attaché/Moscow, in Vietnam as associate director for field operations at the US Agency for International Development and, later, as US mission coordinator and minister-counselor for the US Embassy in Saigon. General Wilson has been Special Forces Group commander; assistant commandant of the Army's Special Warfare School; deputy assistant to the Secretary of Defense for Special Operations; deputy to the director of Central Intelligence; director, Defense Intelligence Agency; adjunct professor of political science, Hampden-Sydney College; chairman, Military Board of Virginia; chairman of the Secretary of Defense's Special Operations Policy Advisory Group; staff consultant to House and Senate Armed Services Committees; advisor on foreign technology, Los Alamos National Laboratory; and senior consultant at the Betac Corporation, Arlington, Virginia.

Lev Yudovich, born and educated in the USSR, emigrated in 1977 to the West. He is an international author of numerous articles on Soviet political and military subjects. He was a platoon and company commander in the Red Army during World War II and a former practicing defense attorney in Moscow. Yudovich has served on the staff of the US Army Russian Institute as professor of military and political science. He has written more than 200 articles for "Radio Liberty/Radio Free Europe" on Soviet political, military, and economic policy.

EDITION A

Army Public Affairs Center
Fort George G. Meade, Maryland

10 Credit Hours

Edition Date: March 1993

SUSBCOURSE OVERVIEW

We designed this subcourse to teach you basic procedures and tasks related to writing feature stories and editorials. Specific information is provided on the concept, function, structure and types/variations of feature stories; writing personality profiles; writing sidebars for feature stories; and the concept, purpose, structure and types/variations of editorials.

This subcourse reflects the doctrine current at the time the subcourse was prepared. In your own work situation, always refer to the latest official publications.

Unless otherwise stated, the masculine gender of singular pronouns is used to refer to both men and women.

TERMINAL LEARNING OBJECTIVE

ACTION: You will identify the function, structure and types/variations of feature stories; and identify the concept, purpose, structure and types/variations of editorials.

CONDITION: You are given the material presented in this lesson.

STANDARD: To demonstrate competency of this task, you must achieve a minimum of 70 percent on the subcourse examination.

LESSON ONE

FEATURE WRITING

46Q Soldier's Manual Task: 214-176-1305

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn the definition of a feature story, the basic approaches to writing the feature story and the different types of features.

TERMINAL LEARNING OBJECTIVE:

ACTION: Define the feature story, identify the five steps to organizing and writing a feature and recognize the different types of features.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook
Feature Writing for Newspapers by Daniel R.
Williamson, Hastings House

FEATURE WRITING

INTRODUCTION

Feature stories are different from straight news stories, which provide answers to the five W's and H --the who, what, where, when, why and how -- with added details for support. Features, in addition to the five W's and H call for imagination, colorful writing and --usually --more research.

By definition, a feature story is a creative, sometimes subjective article, primarily designed to entertain, educate or inform readers about an event, person, situation or an aspect of life.

Unlike straight news stories, features are normally not timely. This is an advantage for editors because features can be held until there is space in the paper. A story about a sergeant whose hobby is making model artillery weapons will be of interest to readers anytime.

There are, however, some features which must appear shortly before or after events. These are called "news features" and do have time value. For example, a feature interview with a survivor of a helicopter crash may not be very interesting six months after the crash.

BASIC APPROACHES

Writing the feature story requires discipline and organization. Concentrate on getting the required information and putting it into an easily understood form.

Start by **defining your topic**. Decide what information you want. Figure out how to get it and who to get it from. Plan how you will write your idea.

Next, **research the story**. Check the newspaper's file of old story clippings and back issues (the morgue) to find previously published material on the topic. Check references such as encyclopedias, maps, etc. If you use reference books, give full attribution.

Then **prepare questions**. Prepare more questions than you think you need to cover the topic when talking to sources.

Set up the interview. During the interview, observe your subject and his surroundings. Note gestures and body language. What does the room look like? Be a "human camera" --describe your subject and pertinent features of the environment. Such details help make the story interesting and believable for the reader.

Depending on circumstances this step may occur once you've defined your topic.

After the interview, **go back over your notes** immediately and add details you may not have noted at the time but that may add to your story. Fill in gaps in your notes while the interview is still fresh in your mind. Make your notes readable before you write. It is best to summarize all details pertinent to the story.

TYPES OF FEATURES

There are several forms features can take. Attempts have been made to classify them, but usually any one feature will exhibit several characteristics which writers should understand, such as the:

- o NEWS FEATURE --Ties closely to the a human-interest aspect of a news event.

Example: A soldier loses 78 pounds in one year, and scores 300 on the Army Physical Fitness Test.

- o PERSONAL EXPERIENCE FEATURE --Tells an unusual experience, either the writer's or someone else's.

Example: A soldier finds missing brother after 12-year search.

- o CONFESSION FEATURE --Written in a confidential tone either humorous or serious, with a positive ending.

Example: A former drug addict tells how he "kicked the habit."

- o NARRATIVE FEATURE --Similar to a short story in form, with action.

Example: Soldiers spend a weekend white-water rafting.

- o ESSAY FEATURE --Written often from library research, explains scientific facts or historical events. The writer must explain facts and figures in an interesting way rather than in the "dry" textbook style.

Example: A story about a World War II battle in which your unit participated and was cited for its action.

- o INTERVIEW FEATURE --Though it has other variations, the interview feature primarily uses a question-and-answer format. Many magazines carry an interview as a standard feature each issue.

Example: The post sergeant major's views on the new physical fitness program.

- o HOW-TO FEATURE --Gives specific directions or information.

Example: How to balance your checkbook.

- o PERSONALITY FEATURE --Describes a person's achievements and focuses on details of character and personality.

Example: A soldier who joined the Army as a high school dropout receives his master's degree.

- o HUMAN INTEREST FEATURE --The classic human interest stories are commonly referred to as "The Three B' s" --Babies, Beasts and Beauties. Stories about children, animals, beautiful women or handsome men always intrigue people. So do stories involving anything odd or out of the ordinary, and stories about adventure.

Features normally fall into one of three categories. The three most common are news features, human interest features and personality features. They may cover such areas as:

- o adventures
- o everyday life and experiences
- o humorous incidents
- o tragic occurrences
- o oddities
- o animals and their antics
- o seasonal items
- o chronological sequences

You can find examples of feature stories in Reader's Digest, People Magazine, or in the Life Style section of the Sunday newspaper.

PRACTICE EXERCISE

SUBCOURSE NO. DI C240

FEATURE WRITING

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. In addition to supplying answers to the five W's and H, feature writing normally calls for more research.
- T F 2. Defining your topic includes preparing questions needed to cover that topic.
- T F 3. Like the straight news story, features are normally timely.
- T F 4. The human interest feature centers on one person.

LESSON TWO

ORGANIZING TEE FEATURE STORY

46Q Soldier's Manual Task: 214-176-1305

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn about the sources for feature story ideas, how to select a point of view for the feature story and how to recognize the three forms the feature story can take.

TERMINAL LEARNING OBJECTIVE:

ACTION: Identify basic sources for feature story ideas, understand how to focus and outline before writing the story, recognize the parts of a feature's structure, and know the three types of structures features can take.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook
Feature Writing for Newspapers by Daniel R.
Williamson, Hastings House

ORGANIZING THE FEATURE STORY

SOURCES OF FEATURE STORY IDEAS

Look around you. What ideas for possible feature stories do you see?

What about that private on the company drill team who speaks with an accent? She was born and raised in Germany; what is she doing in the U.S. Army?

What about that fellow next to you? Why does he keep talking about V-8s, differentials and shocks? Was he really with Al Unser as a mechanic for three years?

What about that retiree you met at the post exchange? He's the one who limps and keeps riling you by calling you "Sonny." Why does he keep talking about Korea, and how today's youngsters have it so good?

The successful feature writer must be inquisitive and develop a keen sense of observation. A well-tended landscape isn't just a pleasant sight to him. He wonders who keeps it trim and why. He inquires into the benefits of conservation or soil erosion control and the alternatives, wildlife sanctuaries or outdoor living. And, chances are, he can forge the answers to his questions into an interesting feature story.

The power of observation -- the ability to accept nothing at face value, but to dig into unanswered questions below the surface of the event -- is an invaluable asset to the feature writer. Just as an artist develops an eye for subtle coloring and learns to portray it in a painting, so must the feature writer learn to see life and his surroundings with an inquiring mind that demands to know all the answers. He must keep his eyes open for stories all the time, on duty and off.

Another excellent source of ideas is the newspaper. News stories report national, state and local events as they happen. They usually do not give extensive background information or cover all aspects of a story. But every day brings news stories that can have feature angles.

Sometimes the idea is obvious. Sometimes it is hidden. The ability to take bare facts from the news page and to give them meaning can produce a good feature article. But the feature must reflect local interest. For example, when a news story announces a change in the town's property tax base, the feature writer can show how this change will affect the local home owner. Thus, the writer localizes the news story for the reader and gives it expanded meaning.

Military news gives the alert and skillful writer more than a handful of items that could be broken down and brought a little closer to home, with issues such as:

- o changes in regulations
- o pay increases
- o policy
- o mission
- o organization

It takes an alert writer to turn bare facts and sometimes dull items into interesting, meaningful articles.

SELECTING A POINT OF VIEW

Before you start writing, decide what point of view is best for your feature. You may write from someone else's, or your own viewpoint. The point of view should be identifiable and consistent in the story.

- o ANOTHER PERSON' S POINT OF VIEW --In human interest features, write from the viewpoint of a person involved in the story.

Example: The Army private closed his eyes, reflecting briefly about his deed. "I heard a woman screaming, 'Help me!' As I turned the corner I saw smoke and flames coming from about 50 feet away. Guided by an infant's cries, I raced inside and crawled through the smokey inferno," he said.

- o "I" POINT OF VIEW --Use this approach when you wish to report what you saw and how you felt about it. But use it infrequently.

Example: I watched the crowd leaving the field and wondered if it....

FOCUS AND OUTLINE

Focusing means to test your collected facts against the original idea you identified in the first step of this process, and to redefine the idea if the facts no longer support your original thesis. Ask yourself: What is this story about? Why am I writing it? What is the main point to tell the readers? Write down your main point in the form of a sentence.

For instance: **This story is about an Army sergeant trying to make the Olympic swimming team.** You might decide to limit the ground you will cover in the story. You might tell about the grueling training the swimmer has done during off-duty time to get ready for tryouts. It would be natural to talk about:

- o hopes and dreams
- o family support
- o how swimming fits in with the soldier's duties
- o how swimming doesn't fit in with the soldier's duties

It would take a crafty writer, a sleepy editor and a very tolerant reader to permit much space to be devoted to unrelated facts such as the swimmer's grades in elementary school and playground friends. You must leave out facts that don't pertain to the focus you've established. Just because the source gave you an interesting quote doesn't mean it must be used. Use only facts that fit. Often a person has other interesting hobbies or aspects of his life. Mention them, but don't get sidetracked.

Outlining helps you identify the facts that fit. It can be a formal process with headings and subheadings. Or it can be as informal as tearing pages out of your notebook and reordering them. The point is, some form of outline will help you order the facts so you know how to begin, what to put into the middle and how to end your story. Very often the difference between writing a difficult story and a simple one is an outline.

STRUCTURE

The feature story usually includes these parts: the lead, bridge, body and ending.

The **LEAD** grabs the reader's attention and "sells" the story. Depending on the type of lead used, it could contain all five W's and the H, or it might answer just one of them. However, the remaining Ws or H must be logically answered elsewhere in the story.

- o Who -This can be personal, by mentioning the subject's name, or impersonal, by emphasizing a person's title or group's name.
- o What -This satisfies the reader's curiosity about what happened. "What" and "who" leads are used most often.
- o When -The time element of an event.
- o Where -Sometimes where an event or incident occurred or is to occur is the most important aspect of a story.

- o Why -The "why" element can be the most important fact when the answer directly affects the reader or otherwise is of importance to the audience.
- o How -Emphasizing the answer to the "how" question could add to the reader's interest in the story.

Sometimes called the "thesis paragraph," the **BRIDGE** is a transition between the lead and body and helps back up or add information to the lead.

The **BODY** develops the story with details.

The **ENDING** may leave the reader with a strong conclusion or summary, or it could leave the reader hanging when the outcome of a situation is still unclear.

Although various diagrams have been drawn up to show the structure or organization of the feature story, there is no one correct structure for a feature. Features may take one of two forms:

Figure 2-1
Feature Pyramid

The feature pyramid uses a strong lead and an ending that is equal, or nearly equal, in importance to the lead. It is perhaps the most common form used. Facts are given in order of increasing importance, and this is the most common structure in feature writing.

Figure 2-2
Chronological Pyramid

The chronological pyramid has a strong lead, a brief bridge, and the body is written in the order in which events happened. The body usually leads up to a strong, climactic conclusion.

Typical features which are written in this format include narrative, personal experience, confession and how-to articles.

Remember that the story content is often the best guide to help determine which format will best present your feature.

PRACTICE EXERCISE

LESSON 2

SUBCOURSE NO. DI 0240

ORGANIZING THE FEATURE STORY

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Possessing sharp writing skills proves to be the feature writer's most valuable asset.
- T F 2. Focusing means to determine the main point you want to convey to your readers.
- T F 3. The lead of a feature story must contain all five W's and the H.
- T F 4. The body of the feature story serves as a transition from the lead and the bridge.

LESSON THREE

WRITING THE FEATURE STORY

46Q Soldier's Manual Task: 214-176-1305

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn about the nine types of feature leads, the purpose of the bridge, how to build the feature's body and about the four types of endings commonly used in feature stories.

TERMINAL LEARNING OBJECTIVE:

ACTION: Recognize the nine types of feature leads, know the function of the feature's bridge, apply the given techniques in order to develop the story's body, and identify the four types of endings used in feature writing.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook
Feature Writing for Newspapers by Daniel R.
Williamson, Hastings House

WRITING THE FEATURE STORY

FEATURE LEADS

The purpose of a feature lead is to get and keep the reader's interest and to set the tone of the story. The feature lead may be as short as one or two sentences or it may take two, three or more paragraphs to fully develop.

Feature leads are classified into the following nine categories:

- o SUMMARY LEAD -- Gives the main point of the story, arouses interest and allows swift scanning of important facts.

Example: It's not easy for retired Sgt. 1st Class Martin T. Johnson to keep up on a 10K fun-run. He lost his left leg five years ago.

- o DESCRIPTIVE LEAD) -- Causes the reader to draw a mental picture of the subject or site and places the reader a few feet away, in position to see, hear and smell what is being written about.

Example: The last chopper sat down at Fire Support Base Ross in a whirl of reddish-brown dust amidst a hundred or so excited, jabbering Vietnamese men. It had been a long flight from Danang and the 30 passengers aboard suffered from ringing ears and buzzing limbs. As soon as the ramp was lowered, there was the usual rush on wobbly legs to solid ground. The search for a familiar face or landmark began by sweat-drenched, green-clad men loaded down with packs, cartons of cigarettes and mail bags.

- o QUOTATION LEAD -- Gives a short, attention-getting remark that is so important that it overshadows other facts of the story. It must also be striking to the reader and serve to lead him into the story.

Example: "I look death in the face every morning," Master Sgt. James K. Tennus exclaimed. "And I love it!"

CAUTION: Quote leads should be used sparingly and they must be well written. Boring "ho-hum" quotes will turn off reader interest. The quote should "hook" the reader into wanting to read the rest of the feature.

- o QUESTION LEAD -- Works best when it asks a question that applies to many readers. If used it should be answered quickly, so as not to leave the reader dangling. This is an effective, yet abused, type

of feature lead. Questions to which the reader can quickly answer "yes" or "no" must be avoided.

Example: Why should an infantryman spend countless hours studying toward a college degree?

CAUTION: A weak question lead could get readers to answer, "Who cares?" A strong question lead, however, will reap benefits since people are usually curious.

- o DIRECT ADDRESS LEAD --The writer communicates directly with the reader. The word "you" is inserted somewhere in the lead. (This second person singular address should be used sparingly.)

Example: If you play your cards right, you could get a free education at the college of your choice.

- o TEASER LEAD --Deceives the reader in a jesting manner and, by grabbing the reader's attention, gently leads him into the story.

Example: It has legs, a thousand toes, a hundred noses and scores of horns. No, it's not a science fiction monster. It's the newly formed 29th Infantry Division marching band.

- o FREAK LEAD --Uses a play on words, alliteration, poetry, or an unusual typographic device to produce the desired effect of luring the reader into the story.

Example: For sale: One town.

- o NARRATIVE LEAD --Puts the reader into the story and takes him through it. Narrative leads are especially effective in telling adventure stories. The writer "creates" a situation and skillfully lets the reader become the principal character, either by leaving a vacuum which the reader mentally fills or by allowing the reader to identify with a person in the midst of the action.

Example: The red taillights of the fleeing Cadillac grew smaller as Sgt. Dan Caper floored the accelerator of the military police sedan, pushing the speedometer needle past 90, in an effort to catch the speeder.

- o COMBINATION LEAD --Combines the best elements of two or more of the previously described feature leads.

Example: How can you stack the deck in your favor for the next promotion board? (Combines direct address and question lead forms.)

Whatever form of feature lead you decide to use for a particular story, you must try to sink the hook into the reader with the first few words. Many communication experts say if you don't get the reader's interest in the first few words, you won't.

THE BRIDGE

The bridge of a feature story could be a paragraph or a short sentence. The bridge backs up the lead or adds information to the lead. It should provide a smooth transition into the body for the reader.

Examples:

- (Lead) It's not easy for retired Sgt. 1st Class Martin T. Johnson to keep up on a 10-mile march. He broke both his legs in six places a year ago in an auto accident.
- (Bridge) The Army sergeant has overcome massive obstacles created by his "handicap." (Story goes on describing how he overcame the obstacles and his feelings about the "handicap.")
- (Lead) "I look death in the face every morning," Master Sgt. James K. Tennus exclaimed. "And I love it!"
- (Bridge) His job is not one many soldiers would consider making a career. Tennus is a demolition expert who got his start in the business during the Vietnam War. (Story goes on to describe the kinds of "death-defying" situations in which he has found himself in his job.)

THE BODY

The body of a feature story is often written in the "feature pyramid" form. Instead of giving details in their decreasing order of importance, you may want to save the most important detail for last to surprise the reader at the end of the article. If that is the case, you would use the "chronological pyramid" format. The vivid details of the feature body can be enhanced by using description, by describing the setting, through statistical information and by the use quotes.

Description

A well-written feature demands that the reader use precise detail and description. It paints a lively word picture of the subject to allow

the reader to form a mental picture of the person he's reading about.

The feature story gives insights that set the subject apart. These insights give the reader the feeling that he has actually met the subject.

Daniel R. Williamson, in his book, **Feature Writing for Newspapers**, calls the personality feature "the journalistic art of capturing a human being on paper." He adds that the writer must try to "capture the character within a reasonable amount of space. He must immediately plunge into the character, grabbing the reader's interest by emphasizing a fascinating facet of the subject."

Many military journalists mistake the use of adjectives and adverbs for colorful writing. Without attention to detail and description, all these words do is make for a lot of editorializing on the part of the writer. This is not to say that all adverbs and adjectives should be avoided. To the contrary, they should be used to give the all-important detail and description that makes a feature come alive. But it is the precision with which they are used, not their use, that marks the difference between a novice and a professional.

The novice might write:

The big man walked across the room to his large, dark desk, slowly sat down, leaned forward and in a friendly manner invited the visitor to make himself comfortable.

Reading this, you would have no idea if the subject is tall, short, slim, stocky, dark or light complexioned. Adjectives like "big" are unclear. You know nothing of the setting of the article. Instead, the writer has tossed adjectives and adverbs into the copy at random and has only told the reader about the scene. These detract from, rather than add to, the writing.

The professional, on the other hand, in describing the same scene might write:

He plodded across the carpet, his muscular 6-foot frame gliding as his ancestors might have slipped through the North American forests. Head forward, chin leading the way, he stalked the mahogany desk that filled the corner of the room near the window.

He pulled the padded chair from behind the desk and eased into the seat. A slit of a smile exposed two even rows of teeth made whiter by their contrast to his bronze skin. The light from the window flashed blue on his black hair.

The chiseled features softened.

"Make yourself at home," he said.

Note the details in the second example. What we have now are the writer's observations. He has shown you the scene.

Describe the Setting

Describing the setting helps a feature come alive. If the interview takes place in the subject's office, is it neat? Cluttered? If it's neat as a monk's cell, the writer should say so. If it looks like a monkey's cell, that should be said too, but in a way which is not insulting to your subject.

If the interview takes place in the subject's home, what is it about the place that reflects the subject's personality and character? For example, if a John Wayne-ish man has his den decorated with ruffles and lace and painted in pastel colors, this certainly tells something of his personality.

Statistics

Statistical material, when used properly, can create reader interest. The secret is to translate the figures into terms the reader can comprehend. Often this is done by reducing large figures to smaller ones:

About 150 Americans die in motor vehicle accidents every day.

Burglaries occurred in the United States at the rate of nearly five a minute, around the clock. That's one burglary every 12 1/2 seconds.

Figures can also be inflated to represent a largest idea:

This year traffic deaths on the nation's highways would fill Yankee Stadium.

Another useful technique which many writers miss is the effective use of mathematical, scientific and technical information. A Little imagination can help make the terms understandable to readers.

Often, similes, metaphors or similar word pictures can be used to make such information come alive. The alert writer might say that "An ounce of gold can be stretched, without breaking, into a 35-mile wire."

Quotes

A sprinkling of direct quotations by the subject will add zest to the feature. The secret here is to select the quotations that will illustrate an aspect of the personality that is being emphasized. If you want to show that the subject possesses a quick wit, use a quotation illustrating that point.

Quotations by the subject can say more than any number of words a writer could put on paper. The manner in which a person speaks, his accompanying gestures, and the actual words used can all create an image for the reader. (Omit profanity or obscenities.)

One caution on quotes: Make them count. Don't carry the story with one boring quote after another. Don't put statements of the obvious inside quotes. Summarize lengthy quotes with concise paraphrasing and use only the liveliest, most telling quotes to let the subject display his character or philosophy in his own words.

For instance, look at this quote:

"I've enjoyed all my assignments. You meet some great people in the Army."

This quote is nothing more than padding, pure and simple. The writer just filled some space by using this quote, a flatly obvious statement that half a million soldiers might make. It reveals little about the personality of the subject. The only thing we learn from that quote is that the writer lacked imagination.

"I used to play drums in a 60s rock band and our concerts made all the practice worthwhile, with the kids screaming and all. Once a bunch of girls came after us, though."

"At first I thought they just wanted autographs, but they cut off our hair and tore our clothes for souvenirs. But that was the only, what you would call, really 'bad' experience and it wasn't really so bad. Overall, I ate it up, even getting tore up. I was a big star in a little galaxy."

This quote is much too lengthy. Probably a faithful transcript of an interview, but some good material gets buried in a lot of slop: . Combining some tight paraphrasing with the brightest quotes fixes it. One way to do it:

Kids screamed at him. Women attacked him, tearing at his clothes and hair.

"I ate it up," he said of his time spent 5-pounding drums in a 60s rock band. "I was a big star in a little galaxy."

Also, make sure to attribute all information. Answer the S W's and H in feature writing as in straight news writing. feature writing style and format is more flexible, the reader still wants to know as much as possible about the feature subject. Be objective; save opinions for editorials. If you draw conclusions, be sure you've given evidence to support them. Avoid libel.

You are free to use more description and descriptive words, and to use more quotes, but you also will need more transitions between paragraphs to help make the story flow better, and to enhance readability. Transitions are words or phrases that link sentences or paragraphs together. Some common examples are:

again	as a result	finally
indeed	on the other hand	meanwhile
still	since	not only (that)
of course	on the contrary	why?
nevertheless	a case in point	on the whole
earlier	while	because

THE ENDING

The conclusion of all good feature stories should be appropriate to the mood of the story and to the type of structure in which the story was written. As in the lead, the writer is limited only by his ability in composing a conclusion.

There are several types of endings which are commonly used in feature writing:

- o SUMMARY ENDING -- Summarizes the story for the readers.
- o STINGER ENDING -- Presents a startling fact or surprise that jolts the reader.
- o CLIMAX ENDING -- An obvious or logical ending to a story told in chronological order.
- o UNENDING ENDING -- Leaves the reader hanging, or tells him the outcome is still uncertain.
- o WRAP-UP -- Ties up any loose ends, answers a question or solves a problem posed in the lead. An anecdote or strong quote often works in this type of conclusion.
- o TIE-BACK -- Refers back to an idea, key word or quote planted earlier in the story, often in the lead.

- o COMBINATION -- Any ending that combines two or more of the above types.

FINAL TIPS

Refer to the following to help develop your feature writing skills:

- o Use the lead to set the tone or mood of the story.
- o Make sure your lead is appropriate to the type of story.
- o Develop the bridge so that it links the lead to the body.
- o Carry the tone or mood of the lead throughout the story.
- o Maintain your story's focus.
- o Avoid using clichés, but do employ such literary devices as metaphors, similes, personification and hyperbole-
- o Use vivid verbs and nouns.
- o Give appropriate description of the people, places and things in the story.
- o Delete unnecessary, nonfunctional adjectives and adverbs.
- o Stay away from such relative terms as "tall," "old" and beautiful.
- o Use meaningful quotes to humanize the story and assist in its flow.
- o Add attribution when needed.
- o Use transitions to carry the reader from one thought to another.
- o Alternate sentence and paragraph length.
- o Translate numbers and statistical data into understandable terms.
- o Make sure that the conclusion to your feature story matches appropriately.
- o Ensure that your feature is free of any factual errors.
- o Ensure that your feature is free of libelous statements and does not violate security, accuracy, policy or propriety.

WRITING SIDEBARS

46Q Soldier's Manual Task: 214-176-1306

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn about sidebars; what they are and how they are used with features.

TERMINAL LEARNING OBJECTIVE:

ACTION: Define a sidebar, recognize a sidebar's purpose, identify how to find a sidebar and understand the fundamentals of writing sidebars.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook
Feature Writing for Newspapers by Daniel R.
Williamson, Hastings House

WRITING SIDEBARS

PURPOSE

If you can visualize a motorcycle and sidecar, you can visualize the sidebar.

Think of the motorcycle as the news story and the sidecar as the sidebar. The sidecar accompanies the motorcycle; the sidebar accompanies the news or feature story.

Daniel R. Williamson, author of **Feature Writing for Newspapers**, defines the sidebar as "normally a brief account that relates directly to a major news story or in-depth story on the same page or at least in the same edition."

In effect, the sidebar rides the coattails of the story. It helps the reader relate to the news by explaining the importance or significance of related facts.

The sidebar may also expand on those facts presented in the hard news story. By using the sidebar for expansion or further clarification, the news story will not be cluttered with excessive detail.

Helping the reader relate to the cold, hard facts is another purpose of the sidebar. If the news story tells the reader 14 people were killed in a post construction accident, the sidebar may show what the victims' survivors are going through. If the news story tells the reader an Army commissary will start selling a new item --horsemeat --next month, the sidebar may show customer reaction.

This points out the difference between telling and showing. Let the facts in the news story tell; let the sidebar show. Readers get the five W's and the H in the news or feature story. The sidebar can help them relate to the facts and bring facts closer to home. Facts and additional information can be included in the sidebar to support the news.

FINDING SIDEBARS

How do you find the sidebar idea? Many reporters discover a sidebar idea while covering a news event. A journalist covering a routine change of command ceremony may find the new commander is a Medal of Honor winner. After interviewing the new commander, the journalist turns in the change of command ceremony story and a sidebar on the commander. Readers get not only the news of the change of command, they also get a story that lets them know something about the new boss.

For the most part, sidebars aren't planned. It will take some digging and some legwork, but even the most routine news story can be complemented with a sidebar.

WRITING SIDEBARS

In writing the sidebar, a brief tieback to the news story or news feature must be included in the lead to make it clear to the reader that the stories go together. The tieback may be as brief as "...a result of Friday's bridge collapse here..." or "... commissary customers' reactions to the addition of horsemeat here..." The tieback simply lets the reader know the news story and sidebar are like the motorcycle and sidecar --they go together.

Although it's a temptation, resist the urge to overwrite. Don't get carried away with your words. The sidebar story should be fairly brief so it can be placed next to or near the news or feature story.

How brief is brief? That depends on the length of your news story. Sidebars may be longer or shorter than the news story. However, if your news story is 20 column inches, chances are you can cut some of the sidebar. Be ruthless when you take pencil to your copy. It will help keep the sidebar brief. Placement of the sidebar, used in conjunction with the tieback, will show the connection between the stories.

A sidebar, however, should not be confused with a multi-part article or a straight second-day follow up story. It is an individual story which grows out of a larger overall story.

Focus your attention on:

- o description
- o transitions
- o mood
- o theme

Use words and phrases that will appeal to the reader's five senses. Show the reader what you have told him in the news or feature story. The following guidelines can be used when writing sidebars:

- o Focus the sidebar on a single aspect of the main story.
- o Write the lead to your sidebar with an appropriate tie-back to the main story.

- o Do not repeat information or quotes found in the main story.
- o Write the sidebar in news or appropriate feature style.
- o Make sure the story is free of factual error.
- o Make sure your sidebar is free of libelous statements and does not violate security, accuracy, policy or propriety.
- o Do not violate the Associated Press Stylebook, and ensure correct use of spelling, grammar, punctuation or syntax.

WRITING EDITORIALS

46Q Soldier's Manual Task: 214-176-2422

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn to recognize the concept, purpose, structure and different types of editorials.

TERMINAL LEARNING OBJECTIVE:

ACTION: Define the editorial, understand the purpose and structure of the editorial and identify the different types of editorials.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook

WRITING EDITORIALS

INTRODUCTION

Ask a journalist to write an editorial and he can think of a thousand things that need to be said. Military reporters are observers of one of the largest government agencies in the world, and they know what needs to be fixed and what doesn't. But before the young writer begins campaigning via "his" editorial page, there are a few things he must know. First, military journalists must understand the purposes of editorials in military publications. Then, they must know what to write editorials about.

Editorial pages exist to support the command. A military editorial writer's job is not crusading to defend First Amendment rights. The job of an Army editorial writer is to support the command and its command information objectives.

That doesn't mean your editorial pages can't be lively and useful. The best editorial pages cover controversy from all sides. They give voice to members of the command as well as the commander. They treat repetitive, even boring, subjects inventively.

EDITORIAL TOPICS

The editorials you write must be of interest to the Army audience. The topics must be written to comply with the commander's command information objectives and may not violate Army policies or regulations.

Often your editor or commander will assign the topic. You may have opportunities to write editorials on a variety of subjects to support community goals, local and Armywide command information programs. Sometimes you will determine the subject of the editorial. When you get to choose the topic, be sure to select one of interest to your audience while also supporting command information goals.

The following subjects are not allowed in military editorials:

- o taking positions on political parties, candidates or politically active groups
- o criticism of a host country or discussion of its politics
- o subjects that discredit the Army or your post, even if the civilian press publicizes the matter
- o attacks on, or ridicule of, the military, its policies, or its members

- o belittling any race, religion, or culture
- o personal pet peeves

DEFINING THE EDITORIAL

Editorials can best be understood by comparing them to other journalistic forms and describing the function each serves.

Straight news stories report the facts without embellishment or conclusions. Interpretative reports explain the news in terms of cause and effect, adding much more in-depth coverage and analysis. Features provide human interest information. Editorials offer opinions and views about events and their effect on people.

For example, a publication might run a straight news story about a woman officer taking command of an all-male unit. A feature story about the event might emphasize her personality and background. An interpretative story about the same event might give more details and expert testimony explaining the role of women in the Army. An editorial on this subject might urge men to give women equal respect and treatment.

TYPES OF EDITORIALS

Whatever the definition, editorials usually serve one of three functions. They:

- o inform
- o influence
- o entertain

Inform

Many military editorials are informative. Some examples include explanation of a new dress code, effects of drug abuse in which the conclusion is only implied and safety precautions for holiday driving.

Influence

This editorial tries either to convert the reader to the writer's (or the command's) viewpoint, or to help him crystallize thoughts on an issue. It uses argument to sway readers to a point of view. These editorials usually include a call to action asking the reader to do something or avoid something.

A good approach in editorials designed to influence is to state the problem, define it, suggest possible solutions and offer a decision on which of the alternatives would be the best choice. Another approach is to state your subject and point of view in the lead, then back up your editorial opinion with logic. No matter what approach is chosen, this editorial must show evidence of sound reasoning and diligent, accurate research.

A good balance of information considering all possible points of view will give the reader the idea that the article and the publication's editorial policy are worthy of consideration.

Entertain

Editorials written to entertain provide insightful, colorful and sometimes humorous commentary. They may present an ironic poke at man's weaknesses or shortcomings. They may look back at the "good old days," reflect a human interest angle at changes in the news or simply reflect on some aspect of life.

A well-written entertainment editorial uses a quick jab of humor or insightful quip to make an editorial point much quicker and more effective than can a dry sober article on the same subject.

Use caution with this technique. Entertainment, particularly humor, is difficult to master and is easily overdone by novices. Also, some people might not appreciate the humor, depending on the subject.

MAINTAINING OBJECTIVITY IN EDITORIALS

An editorial generally forces the writer to take a side. Still, the writer must remain objective, to the degree that all sides of an issue are presented in the editorial. The key to objectivity is research. The editorial writer should arrive at a subjective viewpoint through objective research.

Research

Writing an editorial or an opinion statement is easy. However, writing an opinion that will sway others requires thorough research on the editorial subject.

Compile as much information as possible before writing the editorial. Read books, magazine and newspaper articles about the topic,. interview people who know a lot about the topic. You should know more about the topic than most readers after your research is done. You'll know the good parts of the point of view and the bad parts. You should anticipate what an opponent to the point of view will say, and address those areas in the editorial.

Presenting opinion

Avoid references like "I think," "we feel," or "as I see it" in editorials. These words indicate the editorial is the opinion of one writer, and that its conclusions are not based on research. Remember the editorial is written to support command objectives. It should be anonymous and reflect the views of the command. When you express opinion, be sure your logic is correct. Conclusions must be drawn from stated facts. Your editorial's effectiveness depends on your reasoned argument.

Look at the following examples:

Poor "I think that NCOs should spend more tie listening to soldiers and trying to help them solve their problems."

Better "NCOs are charged with taking care of soldiers. One way of doing this is for NCOs to spend time listening to soldiers and helping them find solutions to their problems."

Presenting all sides

Include all sides of a topic to make it credible. Sometimes it will be like having an argument with yourself. If you find you lose the argument, it's a good idea to select a different topic. Avoid topics on which you have strong views -- unless you're sure you can present a fair, unbiased appraisal of the issue.

Attributing facts

Identify examples and sources fully. Remember that the reader may not have the same background you do and may not know the same people or references. However, too many references may bog down the reader.

While the editorial is an "opinion piece," it must be based on facts. Those facts should be easily identified. If you use facts that are not common knowledge, be sure to attribute your information.

MAINTAINING SECURITY, ACCURACY, POLICY AND PROPRIETY

As with all Army journalism, editorial writing must conform with the principles of SAPP -- security, accuracy, policy and propriety.

Security

Operational security is a must in the Army. In addition to classified information, the editorial writer must be on the lookout for sensitive information. In an editorial you may provide information to potential enemies without realizing it, Think security, especially when you are write about unit strengths and capabilities or about plans for exercises and operations.

Accuracy

Accuracy is a must in all journalistic writing. For the editorial writer to maintain credibility, he must ensure the facts on which the editorial is based are correct.

Policy

Basic public affairs policy is spelled out in Army Regulations 360-5, Public Information, and in 360-81, Command Information Program. In addition, editorial writers must be aware of the Army's policy to protect the privacy of individuals.

Propriety

Propriety is doing what is right or proper. As an editorial writer it is your responsibility to ensure that the editorial is in good taste and doesn't violate the sensitivities of your readers.

THINGS TO AVOID IN EDITORIALS

There are several elements that you should avoid in editorials:

- o vulgarity
- o obscenity
- o lewdness
- o gore
- o perversion
- o excessive violence
- o information which holds the service or its members up to ridicule

COMMENTARIES

Commentaries usually are a recurring portion of the editorial page written by one writer, who takes readers on a verbal trip to get readers to think and be aware of their surroundings and other people.

The commentary is informative and tries to influence. It offers insightful, colorful and sometimes humorous entertainment. Well written, they can often make an editorial point quicker and more effectively than a dry, somber piece on the same subject.

WRITING EDITORIALS

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. It's okay to write an editorial on subjects that discredit the Army or your post, provided the civilian press publicizes the matter.
- T F 2. Informative editorials use argument to sway readers to a point of view.
- T F 3. The editorial writer should arrive at a subjective viewpoint through objective research.
- T F 4. When you express opinions in an editorial, you can voice your own opinion with phrases such as "we feel."
- T F 5. In addition to conforming to Army policy, editorial writers must also be aware of the Army's efforts to protect the privacy of individuals.

LESSON SIX

EDITORIAL CONSTRUCTION

46Q Soldier's Manual Task: 214-176-2422

OVERVIEW

LESSON DESCRIPTION:

In this lesson you will learn about the four parts of an editorial, the different approaches to editorial titles and the three types of conclusions most commonly used in editorial writing.

TERMINAL LEARNING OBJECTIVE:

ACTION: Recognize the four parts of an editorial, understand the various approaches to developing editorial titles and identify the three most commonly used types of editorials.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from:

STP 46-46Q14-SM-TG, Journalist
DINFOS Journalism Handbook

EDITORIAL CONSTRUCTION

INTRODUCTION

Editorials have four parts:

- o title
- o lead
- o body
- o conclusion

The title and lead -must grab the reader's attention and hold it long enough to get him into the body, which is the real meat of the article. The conclusion helps direct action or summarize the argument or point of view.

TITLE

The title serves as the headline for your editorial. The title should attract reader attention. It can also indicate the subject of the editorial. The title can be constructed in normal subject-verb-object form like other headlines, but --unlike news headlines --it may also be in label form without a verb.

Some editorial titles do not indicate the subject, but tease the reader into reading the editorial to learn more about it. For example, an editorial about venereal disease may have a title, "How did it all start?" Or an editorial about acronyms might have a title like, "FDR started it all."

The following list gives you a start in developing a variety of approaches to editorial titles:

- o Label or descriptive --a simple phrase title giving the subject of an article. These titles may not generate much reader interest unless the subject itself is interesting or provocative.
- o Striking statement --a brief phrase or sentence designed to provoke reader interest such as "Smoking can kill you, even if you don't smoke!"
- o Quote --a short, notable quotation, taken directly from the text. These usually center on the main point of the article. For example, "I have a dream."
- o Parody or literary allusion --a take off on some literary work, quote, movie or well-known saying. Just make sure the

majority of readers will easily recognize the reference, such as, "Give me liberty or give me breath. "

- o Alliteration --a phrase or sentence with words repeating the initial sound. (EXAMPLE: wet and wild)
- o Question --a device used to arouse the reader's curiosity or interest with an important issue or light twisting of a common phrase. Be careful when using a question title not to use a question that can be answered with a simple "yes" or "no," or "I don't care."
- o Direct address --talks directly to the reader, is usually a command or request.

LEAD

The lead indicates what is to come in the body of the editorial. The editorial lead is not limited to one sentence. It may consist of more than one paragraph. Unlike the news lead, the editorial lead does not have to summarize the article, or include the important W's and the H. The tone of an editorial is set by the lead. You can build leads for editorials around any of the title types that help explain or introduce your point of view. The lead should entice the readers much like feature leads do. Leads are usually written after the outline for the body of the story is developed. By knowing how the editorial will be structured, you can design a lead that more effectively "grabs" or pulls the reader into the body.

BODY

The body is the meat of the editorial. It contains the support for your position. The reasons the reader should agree with the editorial are contained in the body. The body of an editorial represents the largest amount of information. Unlike straight news writing (important facts first and significant details in descending order) editorial writing offers the essence of the article in the body.

Your first step in developing the body is listing the main points the editorial will cover. From these points you can often develop an outline for the body. This outline guides you through the body and helps you in organizing the lead and conclusion of the editorial.

Whatever method or purpose you use,. the title, lead, body and conclusion must flow from one to the other in logical order, with a definite purpose. Don't trick the reader by starting with a joke and ending with a serious call to action. Don't pose a problem without offering some kind of solution. Don't attempt to change a reader's point of view or to gain

acceptance of an idea or policy with poorly researched, haphazardly organized material.

CONCLUSION

In an editorial written to persuade, the conclusion wraps up and calls for action. In an editorial written to inform, the conclusion will put all the data into perspective and tie back to the main theme or issue. The entertainment editorial's conclusion might offer a humorous or insightful aspect saved just for that purpose.

The three conclusions most commonly used in editorials are:

- o Call for action --Ask the reader to do something or not to do something. Don't confuse this type of conclusion with making demands by using expressions like "In our opinion...." or "As we see it" or "We demand that...." Avoid the imperative voice. Don't give orders.
- o Summary --Summarize your main points. You have a point to make, so make it simple and clear.
- o Quotable --Leave the reader with a brief, appropriate, quotable statement. Use quotes to support a position or for rebuttal.

The editorial conclusion can be any combination of the three types. You will learn from experience how to match a conclusion with different types of editorials.

ADDITIONAL GUIDELINES

Other tips to keep in mind when writing editorials:

Don't embarrass your commander. Controversy may be appropriate in your editorial, but the conclusion should reflect command policy. Explain what is being done about a problem. Also, don't take on Congress, governmental agencies or the local community.

Avoid references like "I think," or "We feel" or "As I see it" in editorials. Remember editorials are anonymous and reflect the views of the command.

Include all sides of a topic to make it credible. Sometimes it will be like having an argument with yourself. If you find you lose the argument, however, it's a good idea to select a different topic. Avoid subjects on which you have strong emotional views --unless you're sure you can present a fair, unbiased appraisal of the issue.

Take a novel approach to commonplace subjects. Topics such as safety, the Combined Federal Campaign and drug abuse require innovative, descriptive, action-packed writing to entice and convince the reader. Reverse psychology may work in some cases.

Avoid editorial topics that are too political or unsuitable for your command level. Remember that your post commander does not set national defense policy. You cannot say editorially that a given deployment or military action is good or bad.

Make sure everything is clear to readers seeing the editorial for the first time. Can they easily figure out your meanings?

Identify examples and sources fully. Remember that the reader may not have the same background you do and may not know the same persons or references. However, excessive references will bog down the reader.

Make sure your logic is correct and direct. Your editorial's effectiveness depends on your clear, reasoned argument.

Avoid preaching or demanding that readers do something. Don't say, "Soldiers will..." or "Soldiers should.. ."

Profanity is not allowed in military newspapers.

Reduce statistics to conversational examples. Instead of just saying "54,135 square miles," also say "about the size of Illinois."

" Keep it short. Many readers tend to shy away from long editorials. Keep them crisp and interesting.

If you can support command policies with appealing editorials, you'll more likely get commander confidence, enabling you to tackle some of the sensitive issues on your installation. Don't look for dirt. Look for solutions.

Finally, editorials for military publications should meet the following criteria:

- o The editorial's topic must be appropriate, without violating or criticizing Army or command policy.
- o The editorial should be written to inform, influence or entertain the reader.
- o Ensure that the story includes four parts: the title, lead, body and conclusion.
- o The subject must be thoroughly researched.
- o All facts must be presented objectively, and all sides of the argument addressed.

- o Make sure that all facts that are not readily verifiable are attributed.
- o The story should be written so that it flows from one thought to the next in logical sequence.
- o Unnecessarily long words or sentences should be avoided.
- o The editorial and its subject matter must not violate security, accuracy, policy or propriety.
- o Ensure that the story is written without violating the Associated Press Stylebook and without errors in spelling, punctuation, grammar or syntax.

FORWARD TO APPENDICES

The following stories have been reproduced as appendices to illustrate the effective use of the key elements of feature stories and editorials.

Appendix A, **"Air Force engineers fire feathered fodder using new 'rooster booster' gun to test jet aircraft windshields"** uses the standard feature story format. It was written by Joan Carter, a former DINFOS student.

Appendix B, **"Mildred doesn't drink here anymore,"** a feature detailing the struggles of a recovered alcoholic, was written by Army Capt. John H. Colt.

Appendix C includes two editorials, **"Mistakes are for learning,"** and **"You pay for vandalism."**

Appendix D contains another editorial which is informative and addresses a medical problem common among black men -- pseudofolliculitis, or ingrown beard. This editorial comes from the American Forces Press Service, a branch of the American Forces Information Service.

Appendix A

AF engineers fire feathered fodder using new 'rooster booster' gun to test jet aircraft windshields

An ironic teaser lead. The writer resisted some of the more ridiculous possibilities.

The thesis describes a serious problem. It shows the need for such testing. We know why this story is being told. Notice how the five W's and H are covered in these first four sentences.

The body includes data and explanation. Note the action verbs and concrete nouns. Note how the quotes are bright. Other material is paraphrased.

A wrap-up ending, simple and effective.

Chicken is on the menu at Arnold Air Force Station Saturday, but it won't be served in the dining hall. Instead it will be blasted out of a new "chicken gun" at 300 miles per hour in a special test of aircraft windshields.

The Air Force tests windshield strength because flying birds can damage them and endanger aircrews. Last year, 1,072 "birdstrikes" cost \$5.5 million in damages to 446 aircraft, according to the Bird Aircraft Strike Hazard team of the Engineering and Services Center.

The tests use chicken carcasses because experiments with water bags and simulated birds didn't give accurate data, said Peter M. Helmbock, project manager.

Willie F. Williams, the man who fires the gun, said, "Plastic chickens don't have the same consistency or bone structure as real birds."

The chicken gun, known as the "rooster booster," hurls chicken carcasses through a 33-foot tube at the windshield of a simulated cockpit. At 300 miles per hour the poultry projectiles smack the windshields with a force of five and one-half tons.

An open shed houses the high technology equipment used to measure the results of the blasts. Space-age pulsars throb their radio waves rhythmically at the carcasses in flight. Ultra-high-speed motion picture cameras record the birds' flights and impact.

These tests help engineers develop lightweight, transparent windshields able to withstand impact forces without breaking, shattering or excessive bending, Helmbock said.

Saturday's test will feature an instrumented mannequin for the first time. This life-sized test dummy will help engineers measure hazards to the jet aircraft crews.

The process has aroused some controversy, Helmbock said.

"I never thought we'd have so many problems with public opinion. The American Society for the Prevention of Cruelty to Animals was concerned about the use of real chickens," he said. "We finally worked out an arrangement they can live with."

Testing uses dead chickens culled by local chicken farmers, Helmbock said.

Lt. Col. Deborah J. Lowe, commander of the 923rd Engineering Squadron, said the chickens would be sold "as tough old roasters" if the Air Force didn't buy them.

"ASPCA finally gave us their blessing when we explained our program to them," she said.

Although these chickens will never end up on Arnold's dining hall table, they are useful. They help make flying safer so aircrews can enjoy their next chicken dinners.

Mildred doesn't drink here anymore

It's a Saturday afternoon and all around the Fort Harrison Golf Club happy young soldiers from the Troop Brigade are taking long pulls from frosted glasses of beer. They are listening to the juke box and enjoying a blessed afternoon off from their training week.

Pvt. 2 Mildred N. Adams has the same flushed expression as the rest. She is relieved, she said, that her first week as a basic journalism student at the Defense Information School here is over.

She taps a slender finger absently against her frosted glass as a "Men at Work" tune blares from the juke box. She smiles broadly at the antics of a young trooper at the next table.

But Mildred's glass is full of diet cola, not beer. And this day is special, like every other in her life since June 21, 1981. She has been sober since then.

Mildred Adams, 23, is a recovered alcoholic.

"I used to be ashamed to tell anyone. I thought I was the only person in the world who had the problem," she said.

She has been in the Army six months. She made no secret about her former drinking problem when she enlisted, Mildred said.

"I told the recruiter in Los Angeles that I was a recovered alcoholic," she said. "He looked me right in the eye, as if he knew something from personal experience, and he answered, 'Who isn't?'"

She said the recruiter was the first in a long line of Army people who would help her bolster a self-image that had been tarnished by two years of problem drinking.

During the normal medical examination process for enlistment into the Army, Mildred underwent an extensive psychiatric evaluation. She passed with flying colors, she said.

"It was one of the happiest days of my life," she said.

She is the daughter of a Chicago steel worker who was divorced from her mother when Mildred was in 4th grade.

She said she now realizes that much of her negative self-image had to do with the childhood pain of imagined rejection by her mother.

After high school, she went to Marquette University for a year. Soon disenchanted with college life, she decided to see more of the country, to live a totally independent life.

She left on a Greyhound bus for Los Angeles. When she arrived there on a muggy February morning she had only \$7 left.

"I had a friend there and she met me. I went out to find a job. The only one I could get was as a waitress working for tips in a diner," Mildred said.

She slept on a couch in her friend's apartment. They had different schedules. Mildred was alone at night, barely 20 years old at the time, and she was afraid, she said.

"That's when my drinking progressed," she said. "I would come home from work at night exhausted. But I couldn't sleep. I didn't have but one friend, and she wasn't around that much.

I started drinking to go to sleep at night."

After a year of living in fear and loneliness, Mildred began to realize she had developed a problem with drinking. She went to an Alcoholics Anonymous meeting.

"That was the beginning of a new me, a new life," she said.

She enrolled in a junior college in Los Angeles and studied music, art and general education subjects. She soon became interested in the ROTC unit on campus.

She said she liked the order, the precision and the discipline of the unit.

She had always enjoyed physical activity. At 5 feet 6 inches tall and 115 pounds, she thought she could compete in a military environment. She met the Army recruiter through her ROTC contacts and enlisted.

Basic training at Fort Ord, Calif., was the most formidable challenge of her life, she said.

"I was afraid and bewildered, which I guess is the common reaction to basic. But I had so much support in the AA meetings that I felt cut off in basic. I was afraid I'd slip," she said.

Nagging at the back of her mind all the time was the notion that she might fall, might fall back into a drinking pattern because of the stress of basic training, she said.

In her sixth week of basic training, she broke down and cried, she said. Her drill sergeant saw her and called her into his office.

She told him that she was a recovered alcoholic, that she was afraid, that she needed to attend the AA meetings for support.

"He told me that all I needed was self-confidence. He said he would be there every time it looked like I was going to stumble. He told me I was a good troop and he was going to see me through, that he would be the support I needed," she said.

"He never made it any easier," she said. "But he reinforced everything I did right. I owe him a lot."

Mildred took another sip of her diet cola, and smiled. Her long brown hair was combed out and she looked trim and fit in a pair of black jeans and a striped shirt. Her eyes are blue, expressive of a clear determination.

Becoming an Army journalist, she said, is the fulfillment of a dream.

"I had a secret desire to be a writer," she said. "I can hardly believe that I'm learning how to be one."

Her other hobby is music, she said, and writing songs.

But for now it is the Army and journalism for her.

"I feel very grateful. They could have said no to me back in L.A. They might not have taken a chance on me," she said.

Air Force Tech. Sgt. James A. Dowd, Mildred's public affairs instructor at the Defense Information School, summed up his own feelings about her.

"She has a lot of guts," he said. "She's open and honest about her former problem. If they gave medals for that kind of bravery, I'd put her in for one."

Mistakes are for learning

The following editorial is reproduced from the Sept. 2, 1983, Seacoast Flyer, attributed to Maj. Ronald A. Roye of Goodfellow Air Force Base, Texas. The editorial was distributed by the U.S. Air Force Air Training Command News Service. The information was taken from an editorial written by Ted W. Engstrom, president of World Vision International.

One obstacle we all face in attempting to reach our potential is the fear of making a mistake. Yet achievement is based upon failure, usually one failure after another.

After 700 unsuccessful experiments to develop the incandescent light, Thomas Edison encouraged his dejected assistants, "Don't call it a mistake, call it an education. Now we know 700 things not to do."

Mistakes. No one is immune. Yet when we look at ourselves, we tend to be mercilessly critical. We speak of ourselves as failures.

American inventor Charles Kettering once said: "You will never stub your toe standing still. The faster you go, the more chance there

is of stubbing your toe, but the more chance you have of getting somewhere." Which translates: When you don't know what to do, do SOMETHING!

Psychologists say that action—any kind of action—is a tremendous cure for depression, even if it's no more than a walk around the block.

Today is a good day to start believing you don't need to live a life of quiet desperation, fearful of any new challenges. You can begin to enjoy using and developing your gifts.

Fear of failure is no excuse for doing nothing. Remember, to do nothing for fear of making a mistake could be the greatest mistake of all.

Make today the day you begin to chip at that mountain of self-doubt. You can read books about how to do it. You can attend seminars. You can think about it until the cows come home. But only you can put mallet to chisel.

Remember, it's OK to stub your toe!

'Somebody' did it

You pay for vandalism

The following is edited from an editorial written by Spc. Steve Lawrence from the July 29, 1982, Fort Campbell Courier.

Mr. Somebody is a special breed of criminal at Fort Campbell.

The victims of almost every one of his crimes are you and I. A percentage of our tax dollar pays for Somebody's kicks.

Have you ever wondered why none of the post parks and outdoor recreational facilities have public restrooms? You can thank Somebody for that!

Somebody literally destroyed all the public restrooms on post. What stands in their places

today are portable toilet facilities, themselves targets of our anonymous vandal.

Ever wondered why so many signs on post are either missing, mangled or full of bullet holes?

Or why the military police have had to beef up patrols around the Cole Park Golf Course, Pratt Museum and outdoor recreation areas?

The answer, plain and simple, is vandalism! Somebody's at it again.

Somebody ought to report these vandals. How about you and I?

PHOTOJOURNALISM I

Subcourse number DI0251

EDITION 9

Army Public Affairs Center
Fort George G. Meade, Maryland ity

5 Credit hours

Edition Date: July 1989

SUBCOURSE OVERVIEW

This subcourse contains five lessons, giving the trained photojournalist advanced information in photojournalism.

These lessons will provide an understanding of photojournalism, a knowledge of obtaining, recording and writing a photograph cutline, cropping a photograph for publication and establishing a field photographic darkroom.

There are no prerequisites for this subcourse; however, you may want to take Basic Photography for Journalists, DI0250, and TEC Lesson 570-214-1098-A, Develop Black and White Film.

This Subcourse reflects the doctrine which was current at the time the subcourse was prepared. In your own work situation, always refer to the latest publications.

The words "he," "him," "his," and "men," when used in this publication, represent both the masculine and feminine genders unless otherwise stated.

TERMINAL LEARNING OBJECTIVE

- Task: In this subcourse you will learn how to obtain and record cutline information, how to write a photograph cutline, how to crop and scale a photograph, and how to establish a field photographic darkroom.
- Conditions: You are given the material presented in this lesson.
- Standards: You will demonstrate a basic understanding of obtaining, recording and writing cutlines, cropping and scaling a photograph, and establishing a field photographic darkroom.

LESSON ONE

UNDERSTANDING PHOTOJOURNALISM

46Q Soldiers' Manual Task: None.

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn basic precepts of photojournalism, how to isolate a subject, how to use lenses, and photographic composition.

LEARNING OBJECTIVE:

ACTIONS: Isolate a subject, use lenses and compose photographs for publication.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: You will be able to perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46Q14-SM-TG
DINFOS Journalism Handbook
AR 360-81
ACCP SS0193
ACCP SS0516

UNDERSTANDING PHOTOJOURNALISM

INTRODUCTION

Photojournalism is a form of journalism in which a story or news item is communicated largely by means of pictures.

A well-written news story, containing all the facts, will suffice for telling the reader what happened, where it happened, who was involved, etc. But, this is only if the reader reads the story. Display elements must be offered to attract the reader's attention to the story, such as headlines, artwork and photographs. By sheer impact, a good photograph will attract a reader's attention faster than most headlines or art work. In addition, it reinforces the information contained in the written account or presents new information that is not written. Headlines are seldom remembered from day to day. News stories, too, fade from memory rapidly, but the "you are there" aspect of a good news photograph may live in one's memory for years to come. Remember the photograph of Jack Ruby shooting Lee Harvey Oswald? How about the headlines or even one sentence of the lead? The military photojournalist fulfills his mission as a vital member of the military establishment either as a photographer or as a photo editor. As a military photojournalist, his mission is to take, process and print photographs for publication.

The military picture editor has a mission which includes planning, selecting, editing and releasing photographs that tell the story of his service. It may also include the taking, processing, and printing of these photographs by himself or by working as a team with the photographer in the field.

TAKING PHOTOGRAPHS FOR PUBLICATION

If you are taking this subcourse you should already be familiar with the basics of photography. In addition to these fundamentals, three requirements are necessary before you can take a photograph for publication. You must:

- o know your subject.
- o know your publication.
- o know your target audience.

Know Your Subject

Millions of photographs are taken every year by amateur and professional photographers alike. Most photographers use people as their prime subject. Photojournalism is a form of communication that portrays people and their environment; therefore, your subject choice is relatively simple. Or is it?

Think of people you have known and select some of the differences between them. The obvious fact is that "all people are different." To photograph people, you must understand their individual differences and explore "in depth" the world in which they live and work. Not the world, but their world.

Some questions you will have to ask yourself and your subject are:

- o What does this man, woman or child do?
- o Where does he live?
- o Why do I want to photograph this subject?
- o What do I wish to show?

In people photography the list of questions is endless.

Know the Publication

Every publication is designed for a particular group of people. Just as we have individuals in life, we have individuals in publishing. Each publication has its own method of reaching viewers with the information that it is putting out.

Consider the possibility of getting the editor of "Good Housekeeping" magazine to use your photograph of tanks on an FTX...not a good idea. But the same photograph sent to "Army Times" might be published because you have chosen the correct outlet for your work. The best way of getting your photograph and text published is to submit them to the publication that can use them.

Know Your Target Audience

Each article in a publication is designed for an individual audience. Not only feature photographs and stories, but even advertising is slanted toward a particular reader. The photographer must know who is going to be reading or viewing his work (Target Audience).

Army subjects will be more interesting to soldiers if-the subject matter lends itself to their particular "world." Farmers read the almanac and "Farmer's Weekly." Soldiers read "Army Times" and the post newspaper (among other things). Generally, people look for newspapers, magazines, and articles that affect their lives or is related to their work.

With this in mind you must know the many different outlets for your work and slant each shooting session toward that "target audience." Armed with this information, you can communicate with viewers concerning timely subjects of interest to them.

Leafing through a magazine, do you stop and examine some photographs more closely than others? What makes us stop and look at a photograph more closely? It might be the subject matter, the composition, the color or lack of color that attracts us.

TWO VISUAL CONSIDERATIONS

Effective storytelling photographs will almost always share one quality -- simplicity. Large images, uncluttered backgrounds, dramatic action and the human element are a few of the devices available to the creative photographer. The application of these devices and the ability to speak clearly with the visual image should be the objective of all serious photographers.

Skilled photographers, when shooting photographs for publication, must know and use two visual considerations --stopping power and impact.

Stopping Power

Stopping power is the quality in a photograph that forces the observer leafing through a magazine to consciously notice a picture. When a photograph makes the reader stop and look it over, it has stopping power.

The majority of photographs depict ordinary people and events, subjects that are all too familiar. Without stopping power, photographs of such subjects would go unnoticed in a mass of pictures --and "unnoticed" in photography is a wasted effort, a worthless product.

Stopping power is one of the essential qualities of any good photograph. It is the device which a photographer uses to ensure that his pictures attract attention. Stopping power can be achieved by:

- o using an unusual treatment that makes commonplace subject matter graphically exciting.
- o recording only unusual subjects.
- o photographing unusual subjects in a graphically exciting form.

Commonplace subjects can be rendered interesting through the use of wide angle lenses, telephoto lenses, filters, screens and other devices. Distortion is one of a number of mechanical means of giving a photograph the "unusual" touch.

Unusual subjects make good photographs and are simple to produce due to their attraction, but unusual subjects are difficult to find.

A photographer must make commonplace subjects interesting to attract a viewer's attention. Simplicity is the key to success. The simpler and more direct, the clearer and stronger the stopping power. Try to isolate the subject as much as possible and eliminate all else. One of the few universally accepted principles for effective presentation of any subject matter is simplicity. For instance, imagine an all-black, large page. Within the page is a one-inch pure white square. In leafing through a magazine, would this get your attention? It should. It makes you stop, look, and wonder, and thus has "stopping power." Posters have surprising stopping power if the composition is simple and the lines and forms are clear, bold and strong.

When shooting for publication, you must try for "stopping power" in your photographs to cause the viewer to look at your work.

Impact in Photographs

Stopping power has gotten the attention of the viewer. Now you must give him something to view with interest and emotion, something to hold his attention.

"Impact" can be defined as holding power, stopping power that affects the observer visually and emotionally. Impact depends upon the content --the visual meaning --of the photograph. When a photograph has emotional stopping power or impact, it commands a deeper kind of attention. A photograph of a child crying, sitting in trash and rubble has stopping power, but when you stop, look, and begin to get a small measure of life in the ghetto, you are experiencing impact in photography. Stopping power makes you look, but "impact" gives you the emotional feeling.

Before you can create photographs with impact, you must first have a genuine interest in the subject. If you do not have a reaction to your subject, you won't produce work that contains any emotional quality. An observer seeing such work will remain unaffected.

To hold the viewer's attention, a photograph must have something to give. It must have meaning. It must be informative, educational, exciting, amusing, or inspiring. The meaning may constitute an appeal to the viewer's heart (like a March of Dimes poster), or it may have sex appeal. It may be the intent to deliberately shock the viewer into an awareness of some condition or situation by calling attention to it. A meaningful photograph is one of the most powerful instruments for arousing public reaction.

In photography, the cardinal sin is the meaningless photograph. Look for "stopping power" and "impact" in your photographs. Your job will be to portray people, Army people. Let your camera become an extension of yourself and consciously strive for meaningful photographs.

DEPTH OF FIELD

Depth of field is the instance from the nearest point of acceptable sharpness to the furthest point of acceptable sharpness.

When a lens is focused on a nearby object, the depth of field is short. If the distance setting is increased, the depth of field increases. This is why it is important to focus more accurately for nearby objects than for distant objects. When focusing a lens so several objects are at different distances, best results are obtained by focusing on a point one third into the distance between the nearest and farthest point. Depth of field always ranges from one-third before to two-thirds after the point of focus (see Figure 1-1).

Figure 1-1. Depth of Field

You can tell what will be included in the depth of field by using the depth-of-field scale on your camera lens. In Figure 1-2 the aperture is set at f/8. The depth of field ranges from less than 10 feet to about 20 feet. At f/16 the depth of field would range from a little over seven feet to a little over 30 feet. Of course if the focus ring were moved then these minimum and maximum distances would change.

This scale is useful in presetting your camera for anticipated shots. When the action starts happening fast and furious you may not have time to focus.

Figure 1-2. Depth of Field Scale

If you know that all of the action will happen between 10 and 20 feet than the camera should be set as in Figure 1-2. For more depth-of-field you would use a smaller aperture.

ISOLATING A SUBJECT

Consider an IG inspection with the company personnel in a neat formation. Everybody is in Class A uniform. SFC G.I.

Jones is the subject of your photograph. Using a standard 1/125 of a second and f/16, you photograph SFC Jones in formation. Does SFC Jones stand out from all the other people in formation? In looking at your photograph, can the viewer isolate SFC Jones from the rest? Probably not. You need to isolate him. Two popular methods for isolating subjects are "framing" and "selective focus."

Framing the Subject

Framing the subject gives the viewer "tunnel vision." His eyes automatically go to the subject in a photograph because

you have channeled his vision. Go to an old building and look through the windows. Do you look at the wood or at the scenic view outside? Let's hope you look at the scenic view. You can use this technique to direct a viewer's attention to your subject.

Frames can be made of anything in the area. The standard frame, at least in landscape photography, is the branches and leaves of a tree. Old as this technique is, it still works, and your prime reason for "being" is to get viewers to look at your work. Door frames, pipes, shelves and windows are common frames you can use to do your job (see Figure 1-3).

Figure 1-3. Framing

Use the frame technique when appropriate. It will work effectively to allow you to communicate with your viewers.

Selective Focus

Remember SFC Jones standing inspection? Under the circumstances you can't very well frame him. Probably the best method of isolating him is to use selective focus. Here's how:

SFC Jones is still in the formation, and you wish to reshoot him using selective focus. You focus sharply on SFC Jones and from your light meter reading choose a faster shutter speed which will allow you to open up the lens diaphragm, decreasing the depth of field. Again, you focus on SFC Jones. This time SFC Jones is in sharp focus, but the foreground people and background are fuzzy. Everything is still in the photograph but you have successfully isolated your subject. Now the eyes of the viewer will not wander, but will stay on the subject of your photograph.

Using another example, you shoot a photograph of a classroom. The instructor and all students are in sharp focus. But when looking at the photograph, the viewer is left to wonder what the subject of the photograph is. Using the selective focus technique you could isolate the instructor or an individual student, focusing the viewer's attention where you want it.

Framing and selective focus are tools for helping photographers direct viewer's attention to the subject matter.

LENSES AND PERSPECTIVES

When working with an interchangeable-lens camera, one of the photographer's variables is perspective. The photojournalist must be aware of the mechanics of so-called "wide-angle distortion" or "telephoto compression," which are distortions of perspective. He must understand how they influence his message.

Wide-Angle Lens

Some photographers select a lens focal length just for image size, without much thought given to perspective. There are times in photography when you will want to use a lens which will exaggerate perspective. Consider a low-angle photograph taken with a wide-angle (35mm and wider) lens of the front view of a 155mm Howitzer. The Howitzer muzzle looks awesome and the viewer gets the impression of strength and power, the exact message the photographer wished to give the viewer. Combined with the extreme depth of field of a wide-angle lens, the subject leaps from the realm of the usual to an interesting portrayal of the photographer's vision. A wide-angle lens is said to give apparent "wide-angle distortion" to a photograph.

Normal Angle Lens

The normal angle lens (50-55mm) is the "working lens" of the photographer. In retrospect, some photographers neglect the normal angle lens because they prefer the distortion and compression effect of other lenses. The normal angle lens is used effectively when the subject matter is not confined to limited areas. If there is room to move around the subject and placement is all that is required, a normal angle lens works effectively.

Telephoto Lens

Telephoto lenses (75mm and longer) are used effectively in "selective focus" situations because they give a more shallow depth of field than shorter focal length lenses. A telephoto lens creates "compressed perspective" which, when used properly, gives a viewer the impression of closeness.

A photograph of a line of traffic taken with a telephoto lens shows automobiles close to each other, and thus lets the viewer see the congestion of our highways. Telephoto lenses are used by the photographer to give compressed

Lenses are tools. Use them to portray your subject in an interesting way. Whether "wide-angle distortion" or "telephoto compression" is used, it is simply another method of holding the viewer's attention and interpreting a subject.

Use the lens that portrays your subject in the manner in which you wish to show it. Never use a lens because it is normal to do so. Let the lens enhance your story-telling capability. Rule your lens; do not let the lens selection rule you.

COMPOSITION

Every now and then you see a photograph that does not communicate, even though it is technically perfect. This is usually because it lacks a creative touch. You may also see a photograph which is creative but not effective because it lacks technical expertise.

The Nature of Composition

Photographic composition is the orderly or pleasing arrangement of the elements within the pictured area. The difference between a snapshot and a strong photograph is how

well the photographer applies the elements and principles of composition.

Learning the art of good composition is similar in many respects to learning any other skill or profession. A good photographer does not just record whatever he sees; he puts together or composes the picture. To do this the photographer either waits until all objects are properly related, or select a camera angle, or he places the objects in their proper relationship.

Good composition serves a purpose, sets a mood, and tells a story. Your camera will record whatever it sees, exactly as it sees it, without any consideration or feeling for what is happening, or why. It is up to you to capture the location, excitement, and attitude of the event. If you properly place objects in the picture, you will give the photograph more meaning by clearly showing the situation and reflecting the feeling of the occasion.

Composition is an elusive concept which involves such factors as camera position, selective focus, perspective, angle of view and proportion. The important thing to remember is that each is an element of choice, to be used the right way at the right time. If the correct elements are not included in a photograph, or if they are included but used incorrectly, the photograph will appear disorganized. When used correctly, however, the elements provide organization, the key to effective photography. Thus, the nature of composition is organization. It depends on you, the photojournalist, to organize your photograph by making a conscious decision to include certain elements or leave them out. Your success in applying the correct elements of composition will determine how effective and how well organized your pictures are.

The Purpose of Composition

The purpose of composition is to emphasize the subject of the photograph, present it in the most effective form and heighten the total effect of the picture. Knowing and applying the elements of composition will play an important role in your photojournalism efforts. Knowing the elements also will give you a set of general standards by which you can critique your work as well as the work of others.

THE PRINCIPLES OF COMPOSITION

Although there are no rigid rules to govern the correct composition of a photograph there are certain principles. You can make sure a photograph is both dynamic and

communicates what you intend if you follow these three principles: explore, isolate and organize.

Explore

Think about the word "explore." Exploring your subject is a comprehensive approach involving much more than a mere glance at the scene before snapping a picture. It is an in-depth approach, involving analysis of the light, awareness of the physical surroundings and knowledge of the particular requirements of the job.

Light

Light is one of the most important considerations in any photograph. You must always be aware of the nature and direction of what is called "incident light." This is the light that strikes the surface of the subject.

There are two types of incident light: direct light and diffused light.

- o Direct light. This light can come from the sun on a cloudless day, a flash, a lightbulb, or spotlights. It is almost always harsh and contrasty, casting strong shadows. Generally, it is not a photojournalist's favorite light because detail is frequently lost in the shadow areas.
- o Diffused light. This light is considered "soft" light because the contrast between highlights and shadows is relatively low and there is detail in the shadow areas. You will find diffused light outdoors on overcast days or in open shade, and from reflected light, such as bounce flash or light bouncing off the walls from the normal light fixtures.

The direction of the light can also affect the composition of the photograph. The basic directions are:

- o Frontlight. This comes from behind the photographer when he faces the subject and casts very few shadows. Because of the lack of shadows, the subject lacks dimension and appears flat.
- o Sidelight. This casts shadows and gives depth. In terms of direction, it is usually the preferred type of light.
- o Backlight. This comes from behind the subject and is the most contrasty. The side of the subject facing the camera is almost totally in the shadow area, but is surrounded by strong light.

- o Light from above. This is usually the least desirable because of the harsh unnatural shadows formed. For example, a photograph taken of a person outdoors in direct light at high noon would show the light striking the top of the head but leaving unwanted shadows in the eye sockets, under the nose and below the chin.

Physical Surroundings

A second area you must explore is the physical surroundings. As you look at the area around your subject, you must remember that, usually, neither the camera nor the subject must be fixed. Generally either or both can be moved, or at least the views changed.

In those instances when the camera is mobile and the subject stationary, such as a ship at dock or a statue, you can change the composition of your photography by shifting your position until the angle of view eliminates or de-emphasizes an unwanted area. You can change to a wide-angle or telephoto lens to alter the perspective, or you can use selective focus. That is, opening up your lens to decrease the depth of field until only the subject is in sharp focus.

When the camera is stationary and the subject mobile as when you are shooting an aerial show or field maneuvers, you can produce the best results by having enough advance information to know what to expect and taking more film than you think you will need. Remember, film is cheap. Don't miss a "million dollar shot" for want of "one roll of film." In a situation such as this you will also want a variety of lenses so you can better control the distance and space between you and your subjects.

When you find yourself in a situation where both you and the subject are mobile, your best bet is to be aware, as the opportunities for excellent shots come and go quickly.

Job Requirement

The third area you must explore is the actual job requirement. How will your photographs be used and when? These will often dictate where you should be during the event, how much coverage you should plan for and what type of photographs you will be expected to produce. For example, you are to prepare a feature picture story for the base newspaper on the military police assigned to your command. Here are some requirements that could influence your coverage:

- o The public affairs officer wants a "positive" image of the military police.

- o The provost marshal would like you to do some night shooting to show the military police are on the job around the clock.
- o The base newspaper editor says he can use "about six" good photographs.

As you can see from just these requirements, you know the approach you will take, the number of "good photographs" you want, and even the type of film you will use.

As you "explore" each shooting assignment, remember there are three areas to keep in mind: how the light can affect your subject, whether the camera and/or the subject are mobile and the actual requirements of the job. If you fully explore these areas, you will be following one of the three basic principles of good composition.

Isolation

Now that you have learned the first principle --how to explore your subject from the standpoint of light, physical surroundings and job requirements -- we come to the second principle: isolation. For your purpose, isolation is that means which the photojournalist applies to de-emphasize or eliminate those objectionable objects discovered while exploring the subject. There are many ways you can do this; the following is a partial list.

- o Relocate the subject. This is surely the easiest and most obvious solution if the subject is one that can be moved.
- o Change the surroundings. If the subject cannot be moved, then perhaps objectionable things around it can.
- o Fill your viewfinder. This simply means, step in close so that the subject will fill or nearly fill the negative, a very simple way to remove unwanted objects.
- o Use selective focus. Open up your lens to decrease the depth of field until only the subject is in sharp focus.
- o Alter the perspective. Take the photo from a different point of view.
- o Frame the subject. Use items such as branches of trees, door frames, windows or pipes to surround the focus of the photograph.
- o Use light. You can emphasize the subject and minimize other areas by lighting the subject only.

Keep in mind that these seven techniques for isolating the subject may-be used individually or in combination. In fact, you will often find it necessary to use more than one to lift your subject from a confusing setting. Also, you may find unique solutions to unique problems. The key is to keep in mind that your subject must not be lost in the other elements of the photograph. This is why isolation is one of the basic principles of composition.

Organization

At the beginning of this lesson, you will remember that the nature of composition was defined as organization, the orderly arrangement of elements within a photograph. Organization is the third principle which, if followed, can greatly aid in the composition of your photographs.

There are many ways to organize a photograph. Usually it depends on the creativity of the photojournalist and the effect he is trying to achieve. For example, a photograph which reflects speed or violence is not organized in the same way as one showing a peaceful or tranquil situation. The elements would be arranged in a different manner, and if you are not aware of the impact of the organization of these elements, you can confuse your viewer or create an impact that is the opposite of what you saw or planned.

There are no rigid rules governing the organization of elements in a photograph. Anyone who goes beyond the snapshot stage of photography learns that working with organization is almost like putting together a puzzle designed to go together in many ways. The following discussion of the organization elements and the impact they create will help you to understand why organization is one of the three basic principles of composition.

Illumination

Without light there can be no photographs. With light there can be both good and bad photographs. Amateurs, the snapshot shooters, consider light only as something that illuminates the scene. Their main concern is to have enough light to take a picture.

As a photojournalist, you must think of light in terms of quality and quantity.

Of course you must have enough light to expose the film. But you must attempt to control and use that light to accomplish other things. Light can be used to give a three-dimensional look to your photograph. It can also be used to de-emphasize unimportant aspects --like the background.

Cropping

There are a few problems with this element of composition, cropping. The main problem seems to be where to draw the line, and the experts do not agree on this. Some say "Crop severely and purposefully; do not make it look like an accident." Others say, "Approach this gently and with trepidation."

No matter what approach you take, you will soon find that cropping can have a dramatic effect on a photograph. As you progress, you will develop your sense of where to draw the line. Apply your own standards and develop your own style.

There are actually two methods of cropping: in the camera, and when enlarging the negative.

- o Crop in the camera. This is usually the best approach, as you will find it is difficult to make major corrections when enlarging the negative. No amount of cropping in the darkroom can save a part of the subject omitted in shooting, or shift light and shadows, or change a background.
- o Crop in the darkroom. The darkroom is a convenient place to "tighten up" a photograph by cropping minor extraneous detail when enlarging the negative. You can also enlarge a portion of the negative when the subject is too small in the negative.

Proportion

Certain scenes frequently dictate the best format. Almost without thinking you use a vertical format for tall things and a horizontal format for a panoramic scene. Other scenes, however, are more subtle and call for more thought on your part. It is then up to you to decide when to use a horizontal and when to use a vertical. There are a couple of things to remember about the impact that each format creates:

- o Horizontal format emphasizes the "right and left" in a picture, the horizon and horizontal lines within the scene.
- o Vertical format strengthens the impression of height and emphasizes the "up and down" and vertical lines in the scene (see Figure 1-4).

Figure 1-4. Horizontal and Vertical Formats

This is very basic, of course, but the point is you must decide the proportions of the final product at the time you take the photograph. You cannot wait till you reach the darkroom only to discover that you have to create a vertical print from a horizontal negative.

Angle of View

The angle of view from which you choose to take your photograph can make or break your photograph. It can add impact or destroy the message you want to communicate. One of the military's top photojournalists once declared part of his success was due to the fact that "I know my knees bend." He was referring to his willingness to get into just about any position to obtain the best angle of view. This sort of person does not hesitate to climb up on a desk (with permission, of course), stretch out on the floor, or even hang by his toes to compose his picture from the best angle.

You too, must remember that your knees bend. Do not settle for the flat-footed, camera-at-eye-level position that is the hallmark of the snapshot shooter. Search for and get into the position that provides the angle of view you need to communicate your message.

A word of warning: don't fall into the trap of believing that an unusual angle of view will automatically assure you of an award-winning photo. Remember, this is just one of many elements of composition that you must use to your best advantage.

Lines

Regardless of the content, most photographs consist of only two elements: shade and lines. In black and white photography, the shades are tones of gray including black and white, and the lines give form to these tones.

The strength, position and direction of lines in a photograph cause certain feelings in the viewer. Here are five types which you should be familiar with:

- o Horizontal Lines. These suggest stability and tranquility. These lines are static, motionless and can become boring if used excessively.
- o Vertical Lines. These lines evoke feelings of height, power, strength, and extend in a vertical direction. There is a certain amount of stability in a vertical line, but it is not usually considered an "active" line suggesting motion or action. However, it is not as static as the horizontal line.
- o Diagonal Lines. These run more or less from one corner to the opposite one and are considered the most dynamic of all lines. They serve as the most graphic symbol of movement and action.
- o Curving Lines. These lines suggest grace and motion, though it is a quiet, frequently rhythmic motion, Lacking the forcefulness of the diagonal line.
- o Motion and Force Lines. Lines of motion and force are actually lines placed in a photograph by the viewer. They occur, for instance, in a picture of a speeding car when the viewer's eyes travel ahead to determine the car's direction. They also occur in photographs when two people are looking at each other. The line of motion is created by the viewer following the "line of sight" from one person to the other. Although technically lines of motion and force are not graphic lines and are actually created by the viewer, they must be considered by the photographer as an integral part of the composition of the photograph (see Figure 1-5).

Figure 1-5. Lines of Force

Forms

There are four basic forms the composition of photography may take-If you are aware of these forms, then you will have more control over the message your photograph gives the viewer. These are:

- o Static. In this form, the graphic elements seem to be at rest. Through this form, the photojournalist can convey tranquil feelings such as restfulness, peace and dignity (see Figure 1-6).
- o Symmetry. You probably know that symmetry is a similarity of form or arrangement on either side of a dividing line or plane. The human body, a butterfly and a leaf are only a few of the many examples of symmetry. In photographic composition, symmetry can suggest perfection or harmony, or even boredom (see Figure 1-6).
- o Central. This form of composition gives a bull's eye impact since it draws the eye of the viewer to the center of the photograph. It is most effective when the major lines in the picture converge at or near the center.
- o Dynamic. This is the most active of the forms. It gives the impression of motion. Photojournalists use it to convey a feeling of action, speed, excitement, drama, violence, strong emotions or struggle. A photograph which is dynamically composed usually has few or no vertical or horizontal lines, and the subject will be made of primarily diagonal or tilting lines in an asymmetrical arrangement.

Figure 1-6. Forms

ACTION IN STILL PHOTOGRAPHY

Composition for Action

You can show motion in still photographs, motion that is real or posed. To get the feeling of motion in a still picture, the viewer must know what occurred the second before the exposure or what will occur in the next second. Place your subjects in positions that suggest motion is about to happen, is happening, or has just finished. A complete action can be divided into three parts --preaction, when the subject is getting ready; midaction, when the subject is in motion and cannot turn back; and postaction, when the subject has completed the motion and is regaining equilibrium.

Time of Change

The best action photographs are taken at the time of change from preaction to midaction to postaction. The first change, the point of tension, is the beginning of the motion. It is the time when the greatest stress and strain is applied. The effort of putting things in motion is evident in the tension of the subject's muscles and his facial expressions.

The time of the change from midaction to postaction is the point of release. At the point of release the effort is reversed. While momentum is carrying the motion forward, the stress and strain is being applied as a break. The effort by the subject at the point of tension or release provides the greatest expression of motion for a still photograph.

Midaction

Midaction is also a good time for photographing if the motion is obvious. Catch the subject in a position that would be impossible without motion. Example: When the subject is in midair or is leaning over so far he would surely fall down if it were not for his motion, or even when he is falling down.

Posed action

The subject need not stand still for posed action pictures. Re can rehearse and then move through the actions as you photograph.

Although posed action provides time for planning and composition, you record the truest expression by photographing the real thing at the scene while it's happening.

Adding Action

You can also add action to your photocomposition by using diagonal lines (leaning bodies), blurring part of the subject (hands or feet) as though they were moving too fast for the camera and blurring or placing the background out of focus as though you're moving with the subject.

Panning for Action

The technique used to blur the background while getting a sharp image of a moving object is called panning. To pan, you move the camera in step with the moving object so that the object is standing still with respect to the camera and the background or other stationary objects are in apparent motion.

Use the following procedure when panning:

- o Get a firm grip on the camera.
- o Plant your feet about 18 inches apart for a firm foundation.
- o Begin your motion before the exposure.
- o Swing the camera with the object so that the object remains centered in your viewfinder.

- o Move the entire top of your body in swinging the camera.
- o Use a smooth, steady motion.
- o Make the exposure during your motion.
- o Keep moving for a short time after the exposure.

The reason you start moving the camera before the exposure, and keep it moving until after the exposure, is to assure a smooth steady motion during the exposure.

STOPPING ACTION

Stop Action Photographs

Panning allows you to get a clear, sharp picture of a moving object; however, the background is blurred. To get both the moving and stationary objects in sharp detail on the same still picture you have to stop the action.

Photographically, you stop the action by using an exposure time so short that the moving object hardly moves at all during the exposure. Usually 1/125 is the slowest speed needed to stop normal human movements.

To take a good stop action photograph, you must have knowledge of the subject and the action so that you can visualize what will happen and plan ahead. You must be alert to follow the action and make the exposure at exactly the right moment, and you must quickly and automatically adjust and operate your camera.

Bright Light for Stop Action

You take stop action photographs with very fast shutter speeds so there is almost no time for motion during the exposure. Usually you increase the lens opening to compensate for an increase in shutter speed, but with stop action you often need the depth of field of small apertures. So opening up the lens is not always the best way to get the proper stop action exposure. When you operate with fast shutter speeds and large f-numbers, you must use fast film and bright lights to get sufficient exposure. For stop action, you need artificial lights, flood or flash, except in brilliant sunlight.

You can use electronic flash to stop action for a scene too dark to record on film without additional illumination. Use the proper speed to synch with the flash, and the exposure time will be the duration of the flash. Speed lamps or

electronic flash units have very high intensity illumination and the flash may be as short as 1/10,000 of a second or faster. You can also use flash units to get the effect of high shutter speeds when the scene is moderately illuminated.

PRACTICE EXERCISE

LESSON 1

SUBCOURSE NO. DI0251

PHOTOJOURNALISM I

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Effective storytelling photographs will almost always share one quality -- simplicity.
- T F 2. Stopping power is the quality in a photograph that forces the observer leafing through a magazine to consciously notice a picture.
- T F 3. Telephoto lenses are not very effective in "selective focus" situations.
- T F 4. The two types of incident light are direct light and diffused light.
- T F 5. The best action photographs are taken at the time of change from preaction to midaction to postaction.
- T F 6. In photography, the cardinal sin is the meaningless photograph.
- T F 7. Depth of field is the distance from the lens to the point of nearest focus.
- T F 8. The depth-of-field scale is useful in presetting your camera for anticipated shots.

LESSON TWO

OBTAIN AND RECORD CUTLINE INFORMATION

46Q Soldiers' Manual Task: 214-176-1308

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn to use a photo caption log while shooting a photo assignment.

LEARNING OBJECTIVE:

ACTIONS: Record the Who, What, Where, When and Why to explain the action in a photograph, at the same time the photo is taken.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: You will know the duties of a photojournalist when obtaining and recording information while shooting photos. You will be able to perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46Q14-SM-TG
DINFOS Journalism Handbook
AR 360-81

OBTAIN AND RECORD OUTLINE INFORMATION

INTRODUCTION

Every photograph intended for publication needs a outline to explain the action, and to identify the people, places or equipment shown. The outline is written to help everyone see the same thing --the action, words and meaning presented in a picture. Otherwise, a photograph will fall short of explaining itself; each person viewing it will develop a different interpretation of it. Outline writing is a specialized form of news, feature and sports writing. In most cases, you must tell the Who, What, When, Where and Why in a single paragraph.

WHO GATHERS OUTLINE INFORMATION

Because this information is sometimes impossible to gather later, it should be recorded at the same time the photo is taken. Recording this information is the photographer's responsibility. Even when a reporter is doing the story that will accompany the photos, the photographer is the one who should record the outline information.

HOW TO RECORD THE INFORMATION

The information may be recorded in a notebook, on a locally designed "caption log" or on DA Form 3315 (Photographer's Caption) . The method is not important, but a log may serve as a handy reminder of what information should be recorded, especially for inexperienced photographers. The log's columns for frame numbers, dates and times, names, equipment nomenclature, action, and type of event would help inexperienced photographers remember to gather more than just names and ranks. An example of a locally designed log is at Fig. 2-1, with an example of a filled out log at Fig. 2-2.

PHOTOGRAPHER'S NAME		DATE AND TIME
SUBJECT/SLUG		LOCATION
POC NAME AND PHONE		ROLL #
FRAME #	ACTION	I.D. (NAMES, EQUIP. LANDMARKS)

Figure 2-1. Example of a locally designed caption log.

WHAT TO RECORD

Keep in mind when recording cutline data that someone else besides yourself may actually write the cutline. Your notes should allow anyone to match up the photos to the notes and write a good cutline. At a minimum, the information recorded during the photo assignment should answer the following:

Who

Identify people in the photo by rank, full name, title, hometown, etc. Also note relative positions of people in the photo when there are more than one and if it's not obvious who's who by action, age, gender or rank. Sometimes it's helpful to note the clothing or physical characteristics of the people being photographed. Keep in mind that when you are shooting black and white film it will do little good to note "yellow T-shirt" or "red dress." But notes such as "Yankees T-shirt," "sunglasses," or "curly blond hair" would help identify the subjects. If the photo is of a crowd or large group --the start of a Fun Run or a crowd scene at the community fair, for example -- individual ID isn't necessary.

What

The "What" can apply to two things:

- o What's happening in the photo. The "what's happening" refers to the action of the photo. In the log or notebook, it may be necessary to only jot down a word or two to describe the action --"slicing cake," "mixing concrete" or "removing oil filter," for example.
- o What equipment is in the photo. Often unusual equipment will be included in a photo. The equipment should be identified. An M-16 rifle might not require identification, but an M-16 with an M-203 grenade launcher might. Radios, tracked vehicles, aircraft and watercraft should always be identified. Never guess or suppose you know the proper nomenclature; ask an expert on the scene. Sometimes minor differences in equipment models result in different nomenclatures, and readers love to point out such things to editors.

Where

Be sure to record the location of the action. Write down the name or number of ranges, street names, building names or numbers, etc. If there are landmarks, either natural or man-made, identify them as well. These might include rivers, lakes, statues, bridges, mountains, etc.

When

Record the time and date the photo was taken. This is especially important for "wild" or "stand-alone" art that will not be accompanied by a story.

Why

Unless it's obvious, record why an action is taking place. Is it part of an annual FTX, a post basketball championship, or monthly awards ceremony? This is especially important for "wild" or "stand-alone" art that will not be accompanied by a story.

MATCH UP THE INFORMATION WITH THE PHOTO

The photographer should record the cutline information for each frame he shoots by noting the number in the frame counter on the camera or by simply writing in his log or notebook "Frame 1, 2, 3," etc. Obviously, if several frames are shot of the same subjects and action, it is not necessary to record the information each time. For example, several shots of the same person taking a PT test would not require you to record "running," "doing push-ups," and "doing sit-ups."

WHEN TO RECORD THE INFORMATION

You should record the needed information immediately after each shot or series of shots. Don't let subjects get away without getting the information. They will be hard or impossible to track down later, and you may forget who you shot or who was doing what in the photo if you wait until later. The exception would be sports or other activities where it is impossible to interrupt the action. In such cases, you should let the subjects know in advance that you will be taking pictures and will need to get identification as soon as possible after the event. Note uniform numbers, clothing or physical characteristics when the photos are taken, then get names afterward. Or, record information during breaks in the action.

WHEN SHOOTING MORE THAN ONE ROLL OF FILM

When more than one roll of film is shot on the same assignment, the photographer should number the rolls and correspond his log or notebook to each roll. The rolls can be marked with a permanent felt-tip pen on masking tape attached to the film canister. You can also write "Roll 1," "Roll 2," etc. on a page in your notebook, then take a picture of the page after you load a new roll of film. When you develop the film, your first frame should be of the notebook page with the roll number written on it.

SPORTS PHOTOGRAPHY HINTS

Sometimes film can be identified as Roll 1 or Roll 2 by taking pictures of clocks or scoreboards during the shooting assignment. This technique is especially handy when shooting sports. After photographing a key play, the photographer can quickly-shoot a picture of the scoreboard to record the score and at what point in the game the play occurred. When shooting team sports, it is also a good idea to get a copy of rosters or lineups that match names with uniform numbers to submit with the photos to the editor or supervisor. Be sure to have a coach verify the numbers and names are correct, though. Often programs have misspelled names or incorrect uniform numbers.

FILING OUTLINE INFORMATION

After the photos are printed, the outline information should be filed permanently with the negatives or contact sheets.

PRACTICE EXERCISE

LESSON 2

SUBCOURSE NO. DI0251

OBTAIN AND RECORD CUTLINE INFORMATION

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Cutline information should be recorded on a caption log, notebook or DA Form 3315.
- T F 2. The photographer should record the cutline information because he will always be the one to write the cutline.
- T F 3. The "what" can apply to more than just what's happening in the photo.
- T F 4. The best source for verifying names and uniform numbers is the program guide.
- T F 5. When shooting more than one roll of film you should keep track of them by folding your notes and putting them in the film canister.

LESSON THREE

WRITE A PHOTO OUTLINE

46Q Soldiers' Manual Task: 214-176-1309

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn to write a cutline for a photograph.

LEARNING OBJECTIVE:

ACTIONS: Write a four-part formal or normal cutline that identifies the people, equipment and landmarks in the photograph.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: You will know the duties of a photojournalist when writing a cutline. You will be able to perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

WRITE A PHOTO OUTLINE

INTRODUCTION

In the previous lesson, you learned how to gather and record outline information as you took your photographs. In this lesson, you will learn how to use that information to write outlines.

Outlines are the reader's anchors, the only sources of common information to tell all your readers what's happening in a photograph.

THE FOUR-PART OUTLINE

At times, the words "outline" and "caption" have been used interchangeably, but it's important to draw a distinction between them.

A outline has four distinct elements, all of which must be addressed: identification, action, background and credit. The caption usually deals only with the action taking place.

At times, the caption may be just a "mini" or "skeleton" headline, or short line of type beneath or near a picture, giving just enough information to describe what's going on in the shot. At other times the caption goes between the photo and the larger outline.

Here, we will dwell on the formal, four-part outline, its content, its placement and a bit of typography.

Identification

The first sentence in the outline, called the action sentence, should identify people, equipment, landmarks and location in a photograph.

- o Equipment. Identify equipment that is not familiar to most of your readers. Most readers know what an M-16 looks like, so you don't need to identify it. However, if the M-16 has a grenade launcher attached, you may need to identify it as an M-203 Grenade Launcher in the action sentence.
- o Landmarks. The identification of significant inanimate objects such as buildings, mountains or lakes in a photograph should be included in the action sentence. This is especially necessary if the landmark cannot be readily identified from the photograph. For instance,

most people know what the Statue of Liberty looks like if they see it from top to toe. However, a photograph of a soldier looking out of the observation deck in the statue's crown will require identification of the statue.

- o Location. If your cutline is not destined for an external publication (and therefore will not begin with the dateline), you should include the location of where the photograph is taking place in the action sentence. We will talk more of datelines later.
- o People. Identify people by rank or title and first and last name (the middle initial is usually not needed). Give enough identification to identify who's who in the sentence, describing those directly involved. Save long, detailed titles and descriptions for later sentences to avoid a cumbersome action sentence.

There are several ways of identifying more than one person in a photograph. They are as follows:

- o Position identification. Whenever a specific position identification is necessary, simple methods prove the most effective. Identify people with (left) or (right) or (center), or (from left). Give position identification when a person is first mentioned. Some publications will use (l.) or (r.) rather than spelling out the words left and right. Be consistent with your style throughout your publication.

EXAMPLE: Spec. David Smith (left) and Spec. Ralph Jones march across the finish line at the end of this year's annual Fort Jackson 25-Mile Road March.

- o Contrast. Common sense tells you that in a picture showing an Army male and Miss America, you don't need to say who is who. Similarly, in a picture showing a general pinning an award on a sergeant's uniform, when both ranks are clearly prominent, you don't have to say, "Gen. Myers (left) pins..." Clearly visible rank insignia, gender or age differences usually won't need a list of the positions of the people involved.

EXAMPLE: Julia Henderson, 3, daughter of Sgt. Henrietta Henderson, shakes the hand of post commander Maj. Gen. Sam Donaldson at the opening of the new Davis Child Development Center.

- o Obviousness. Obviousness takes contrast a step further. Portions of the photograph will make it unmistakably clear who is doing what.

EXAMPLE: Choo-Choo the Clown hands a balloon to disabled veteran Cliff Debuque during a recent visit to the VA hospital.

- o Action. This form of identification goes by the action being performed. A picture with one person throwing a football and another getting ready to catch it needs no position identification to tell who is doing what.

EXAMPLE: "Jumpin'" Joe Harris throws a 30-yard pass to Hogs teammate Willie "Hands" Wilkerson to win 17-14 and qualify for the playoffs in this season's Orange Bowl.

- o Elimination. Position identification will reach a point that allows identification by elimination. When three people are featured in a picture, and two have already been identified, the third's name can appear with no designation as to position. His identification will be obvious by elimination.

EXAMPLE: Sgt. Jim Carver (kneeling), Sgt. Andrew Anderson (sitting) and Sgt. Tony Guccione read a map in preparation for the upcoming Common Task Testing.

Pictures showing large groups must be handled on an individual basis. Impersonal identification may be necessary when discussing a "team" or "crew." Standard identification methods may prove adequate when writing a cutline for a picture in which only two or three people in the group are involved in the action. However, when the time comes to identify several people, the best method might be a simple (left to right) or (left to right, front row). Never cram a group listing of names into the action sentence.

There may also be situations when everyone in a picture need not be identified. They -may be far in the background, part of an audience, etc. The decision to identify someone will depend on involvement in the action, prominence in the photo, or a question you feel may arise in your reader's mind. In these cases, there is no all-inclusive rule. Just use your judgment, or ask your editor.

Action

Use the historical present tense to write the first sentence in a cutline, just as they are used in new headlines. Use verbs such as "runs," "walks," "plays," "presents," "shoots," etc. Do this because pictures, like paintings or sculptures, freeze a moment in time. Of course, the picture is now past tense, but the reader is viewing it for the

first time and the verb describes the action as if it's taking place now. The present tense adds immediacy. Compare the two following action sentences:

- o Army Pvt. 2 Alvin C. Klink swims through swirling flood waters to rescue six-year-old Wendy B. Flora.
- o Army Pvt. 2 Alvin C. Klink swam through swirling flood waters and rescued six-year-old Wendy B. Flora.

Which has the more drastic impact?

One problem that arises in using this verb tense is dealing with the "when" element. Notice the contradiction in: "John Terry slams a home run over the center field fence in league action Friday." Mixing tenses is not only a grammatical error, it's jarring to the reader. So don't use the "when" of a picture in the first sentence. Shift to the past tense immediately after the action sentence (Example: "The game was held at the post baseball field Friday.") The rest of the cutline should be entirely in the past tense.

Background

The third element of cutline writing is background information. This is the additional data necessary for complete understanding or perspective of the photograph. This information could take up one or more additional sentences. The amount of information necessary will depend on the picture's use, subjects involved, whether it will appear with a related story or stand alone, and how and where the picture will appear.

This part of the cutline should explain any of the W's or H that was not explained in the action sentence. This is a good place to put the "when" element to avoid mixing tenses in the action sentence.

If a picture appears in a military publication keep short your explanation of common military terms and equipment. If the same picture is to appear as a public news release in a civilian publication, a more detailed explanation may be necessary. Background information may be omitted if the photo accompanies a story that explains the photo. In this case, the cutline will consist only of the first sentence, a "skeleton" cutline.

Credit

Photo credit is the fourth element of a cutline. You should give credit to the photographer or releasing agency in the

final sentence of a cutline. The sentence should be separated by parentheses from the rest of the cutline, like this: (U.S. Army Photo by Staff Sgt. Henry J. Moran). In some publications, the photographer gets credit only in the masthead, and photo credit only appears with a picture when taken by a photographer not working for the publication. For releasing agency credit without the photographer's name the credit would look like this: (U.S. Army Photo).

Most publications use a blanket statement for consistency. Credit for a picture story may appear as a tagline on the main cutline (Photos by...) or as a small headline in the layout. Whatever method is used, photo credit should be addressed, and the style used should be consistent. Proper credit for pictures can also go a long way in fostering good relations with photographers and local photo labs.

Datelines

Datelines are used on external releases, and precede the action sentence in the cutline. Datelines contain the city, town or installation name (in all capital letters) and the state, country or territory where it is located.

EXAMPLE: FORT WAINWRIGHT, Alaska -- Soldiers from the 6th Infantry Division dig into a snowbank during Brim Frost 89 (U.S. Army Photo by Pfc. John Everest).

Be sure that "Fort" is never abbreviated in the dateline, and that the state is abbreviated (or not) according to the AP Stylebook.

Datelines may also contain the source of the story. The source would follow the city name, in parentheses.

EXAMPLE: NEW YORK (AP) -- Snow falls on the Varrazano-Narrows Bridge entrance near Fort Hamilton, N.Y.

Typography

When writing cutlines for use in your publication, pay attention to typography. When cutlines are set in a larger or different type face than body copy, pictures will show up better. Boldface 10-or 12-point type would offer a decent contrast in a publication using standard 10-point body type. Or, consider setting the cutline in Italic type. Something should be done, in any case, to set off the cutline, so the reader cannot confuse it with standard body type.

Cutlines may also have a boldface or all-cap "lead-in" to draw a readers attention.

EXAMPLE: THREE TIME WINNER -- Capt. Elwood Houndsberger captures the
Columbus Marathon for the third consecutive year with a time of
2:49.

Position

Cutlines may be moved around the picture for various effects or design requirements. They most commonly appear directly beneath the picture, set in the same column width as the photo. They may, however, appear alongside a picture, as a side cutline, for various design reasons.

The cutline should be set in block style, with left and right margins even with the sides of the picture.

LESSON FOUR

CROP AND SCALE A PHOTOGRAPH

46Q Soldiers' Manual Task: 214-176-1'326

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn to crop and scale photographs to be printed in newspapers.

LEARNING OBJECTIVE:

ACTIONS: Crop a photograph to safeguard information or to eliminate unnecessary or distracting elements in the photograph using the Rule of Thirds and Cropping L's.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: Determine the cropped and reproduction dimensions of a photograph to within plus or minus .125. Scale a photograph using the diagonal method to within plus or minus .125. Scale a photograph using the proportional wheel method without error. Write a guideline for a scaled photograph to include, in order, the elements of column width, reproduction depth and percentage of enlargement or reproduction. You will be able to perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

CROP AND SCALE A PHOTOGRAPH

INTRODUCTION

Poorly cropped and improperly scaled photographs clearly point out a training weakness within a newspaper staff.

Cropping a photograph requires that you eliminate distractions, ensure the quality of composition within the photograph and that you properly frame the subject. When finished cropping, the center of interest should be clearly defined.

The cropped photograph then must be scaled to fit a hole in your newspaper design. Scaling a photograph is the act of enlarging or reducing a cropped photograph to fit a hole on a newspaper page. Scaling starts with at least three known dimensions: the cropped width and depth and either the reproduction width or depth. When a photograph is scaled, the depth is enlarged or reduced proportionately with the width, or vice versa. Scaling the photograph identifies an unknown dimension for the soldier, either the reproduction depth or width. A photograph is scaled before it is screened (the halftone dot pattern used for newspaper reproduction of artwork). Scaling is accomplished using either the diagonal method or the proportional wheel, or possibly an alternate method, the mathematical formula.

In this lesson, you'll learn to crop a photograph. You'll also learn to scale that photograph to fit a given space within a newspaper design.

CROPPING

Cropping a photograph is the act of eliminating unnecessary or distracting elements in the photograph, ensuring pleasing composition and the smart framing of the center of interest. This is done by trimming away parts of the photo from the right, left, top, bottom or all four sides. Photos are seldom used in publications just as they come out of the darkroom. There are many considerations involved in cropping a photograph.

SAFEGUARD INFORMATION

As a public affairs practitioner, your first responsibility is to ensure security, accuracy, propriety and policy are not violated. Army Regulation 360-5, Public Information, spells out the public affairs audiovisual policy.

The public information regulation reinforces the guidance that we must not compromise safeguarded information. Intelligence and counter-intelligence matters are a function of the G-2. Security matters are a function of the G-3. Seek guidance from the experts on questionable matters. If still in doubt about a subject matter, don't use the photograph. Ideally, journalists will have been trained to avoid secure or sensitive areas. If, however, there is a lapse of security and photos are taken in a secure area, that film should be turned in to G-2 for disposal.

Security

Some areas of concern in security include command post and field training exercises. During exercises, operations plans, maps and equipment can be easily compromised by a photographer. Access is usually limited and photographers are kept away from secure areas, but breaches of security may occur in the heat of battle. As the saying goes, operational security is everyone's business. When cropping a photograph for reproduction in the newspaper, be especially aware of the background areas that might reveal classified information. Remember, exercises test war plans, and those plans cannot be compromised.

Policy

Policy considerations are spelled out but are not limited to the provisions of AR 360-5. The Department of Defense and Department of the Army have release authority over certain types of information. Information on weapons systems, nuclear, biological and chemical warfare, controversial national and international subjects, and certain Army contracts will have to be approved for release. In overseas locations, local policies come into play. Photographs of antigovernment protests in your host country, for example, normally should not have been taken in the first place. If you allow the photograph to be published in your newspaper, no matter how good your cropping job, you may enrage the host country and your superiors. Policy considerations also include uniform violations, unsafe acts (e.g.--the soldier sleeping on a tracked-vehicle), and promotional activities favoring one organization over another (e.g. --Association of the United States Army publicity about the Non-Commissioned Officers Association).

The Privacy Act

Guidance regarding The Privacy Act is included in AR 360-5. The Act is designed to safeguard individual privacy. AR 340-41 implements The Privacy Act of 1974.

Propriety

Beauty pageant swimsuit competitions, a soldier in an embarrassing pose, and ethnic misrepresentations are but a few of the many propriety violations you might face. Although a photo editor should catch such violations during the process of photo selection, you also must check for violations in the cropping phase.

Accuracy

Make sure the photograph reflects reality. A photograph taken from the wrong angle or at the wrong time can, in fact, misrepresent the facts of the story. A road race taken at the finish line can show the second place finisher ahead of the winner, if taken from the wrong angle. A sneeze or facial twitch during a somber ceremony can make the subject look like a fool in addition to misrepresenting the story.

DISTRACTIONS

When cropping, narrow the cropped area to the center of interest as much as possible. Crop ruthlessly; enlarge generously.

Distractions come in the form of anything that takes the eye away from the center of interest and action taking place. It could be a spectator in the stands at a baseball game. It could be a student looking away from the teacher in a class. It could be anything that takes away from the purpose of the photograph. Eliminate everything that does not contribute to the photograph.

Try to limit the number of people in the photograph to three, or only those necessary to tell the story. When cropping people, do not crop them at the neck, waist, knees or other joints.

DEAD SPACE

The center of interest should be contained to avoid unnecessary dead space in the photograph. But in cropping out dead space, leave enough space to accommodate the action of the center of interest. If, for example, a car is traveling to the left in the photograph, leave room on the left for the vehicle to travel. Do not cut it off at the front bumper. The car needs dead space in which to travel. If the subject or center of interest is looking to the right in a photograph, you must allow enough dead space for him to

look into. However, many times too much dead space is left in a photograph. Too much background may make the center of interest get lost or not stand out.

Do not crop a photograph into a square shape. Square photographs are uninteresting and unappealing to the eye. Photographs should always be cropped into a rectangular shape, either vertical or horizontal.

The cropping marks are made at or near the corners of the photograph. A china marker normally works best when making your cropping marks in the borders of photographs. China markers allow you to make changes without difficulty and mess (see Figure 4-1)

Figure 4-1. Cropping Marks on a Photograph

AESTHETICS

The aesthetics, or beauty, of the photograph should be improved by cropping. The Rule of Thirds, as shown in Fig. 4-2, suggests that the center of interest be roughly positioned at one of the four intersections created by equally spaced horizontal and vertical lines that divide the photo into horizontal and vertical thirds. If the subject is centered in the photograph, as is frequently done by amateur photographers, the photo is often static or boring.

Figure 4-2. Rule of Thirds

Additionally, when considering the aesthetics, cropping should be based on movement of the subject, leading lines, lines of force, and other framing considerations. Leading lines draw the reader to the center of interest or action. Leading lines can be real, or implied or suggested. A tabletop, for instance, may lead to the center of interest.

SHAPES

The shape of the photograph also must be considered when cropping it. Normally, a 3: 5 proportion is most pleasing to the eye. Proportions of 2: 3, 3: 4, 4: 5, 4: 7 and etc. are acceptable proportions. Simply cropping a photograph square, 3: 3 in this case, ultimately leaves a newspaper page dotted with square blocks putting up little fight for attention. Square shapes are boring.

When considering the shape of the photograph, there are times when a strong vertical or horizontal will improve the look of a newspaper. Obvious examples where extreme horizontals and verticals work well include tall buildings, parades, travel photo features and many sporting events.

PHOTO WITHIN A PHOTO

Careful examination of a print may allow you to extract two or more reproduction-quality photographs from a single print. There may be two centers of interest or separate actions taking place that separately qualify as photographs. In a football game, an offensive lineman may be holding the star defensive end while a wide receiver catches a short

pass across the middle of the playing field. Both actions could be stand-alone photographs.

CROPPING L's

A useful tool when narrowing the photograph to its center of interest is the "cropping L." Cropping L's are L-shaped cardboard devices, often black in color, used to eliminate dead space. Placed over the photograph in the form of a rectangle, they can be adjusted to see the effects of cropping before a crop is actually made. An editor uses them to frame the photograph prior to cropping. (See Figure 4-3.)

Figure 4-3. Cropping L's

PHOTO DIMENSIONS

Before you can scale a photograph, you normally will know three dimensions: cropped width, cropped depth, and reproduction width or reproduction depth.

Cropped Width (CW)

The width of the photograph in picas, columns or local unit of measurement after cropping has been completed. In scaling artwork, width is usually represented in picas, columns or the local unit of measurement. Width is not usually represented in inches. (This is because most other

horizontal measurements in newspaper design are in picas, columns or a local unit of measurement, such as ciccros.)

Cropped Depth (CD)

The depth of the photograph in inches after cropping has been completed. Depth is usually represented in inches, NOT picas or columns. (Again, this is because most other vertical measurements in newspaper design are in inches.)

Reproduction Width (RW)

The actual width of the photograph for reproduction. This is the predetermined space allotted for the photo before cropping or scaling takes place. The measurement usually is given by columns, 2 columns, 3 columns, etc. You must know the standard width of the column and alley, the space between the columns: one pica, one-eighth inch, etc. (See Figure 4-4.)

Figure 4-4. Photographic Dimensions

You will use the three known dimensions (CW, CD and RW) to determine the unknown dimension, usually the reproduction depth.

Reproduction Depth (RD)

The number of inches deep the photo will be after enlarging or reducing to fit in the space allotted for it on the newspaper page.

Many times you will have set aside a vertical space to fill on a newspaper page design. In such a case, you are using the cropped width, cropped depth and reproduction depth to establish the "unknown" reproduction width. This "backwards" procedure frequently is used in photo layouts where standard column widths may not apply.

SCALING

Scaling is the act of either enlarging or reducing cropped artwork to fit in a hole on a newspaper page. You cannot scale a photograph before you crop it, since you must first know the cropped dimensions. Once you know them, you can scale the photograph to snugly fit that hole. In scaling a photograph, you are trying to determine either the reproduction depth or the reproduction width. As you enlarge or reduce the photo to reproduction width, the reproduction depth will change proportionately. And vice versa. As you scale for reproduction depth, the reproduction width will change proportionately. There are two simple ways to scale the artwork to size:

- o The Diagonal Method
- o The Proportional Wheel

An alternate method of scaling is **The Mathematical Formula**, which will be briefly discussed later.

THE DIAGONAL METHOD

The diagonal method of scaling artwork is a mechanical procedure. This is the least accurate method of scaling. It does not require great mathematical skill or special tools. (Figure 4-5 is an example of diagonal scaling.)

To use this method, follow these steps:

1. On a separate sheet of paper, draw a rectangle which has the same dimensions as the cropped artwork.
2. Draw a diagonal line from the lower left corner through the upper right corner. Extend the line beyond the corner if you are enlarging the artwork.
3. Measure from the lower left corner, along the base line, to the width desired for the picture. Make the base line extend to that point.
4. Draw a vertical line up from the column width mark. Stop where it and the diagonal line intersect. Measure the vertical line. That measurement will be your reproduction depth.

Figure 4-5. An example of diagonal scaling

THE PROPORTIONAL WHEEL

Perhaps the most common way of scaling is the proportional wheel method. The proportional wheel has a movable inner disc with a window mounted on an outer disc. Both discs have unit graduations from 1 to 100 (see Figure 4-6). Any unit of measurement can be used with the proportional wheel. To use the wheel, you will need to know three of the four measurements involved in scaling. You must know the cropped width, cropped depth and reproduction width, or the reproduction depth if establishing a reproduction width.

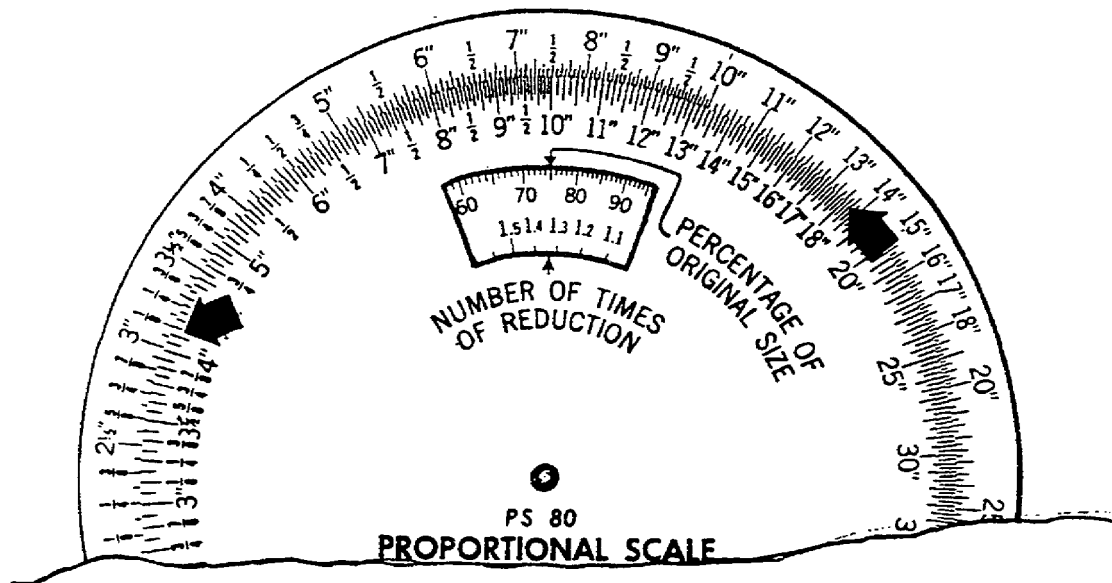

Figure 4-6. Finding inches

EXAMPLE:

The cropped width of a piece of artwork is 18 picas and the cropped depth is 4 inches. The artwork is to be used in a one-column, 13.5-pica wide space.

First, align the cropped width (18 picas) on the inner disc, with the reproduction width (13.5 picas) on the outer disc.

Next, find the cropped depth (4") on the inner disc and read the reproduction depth opposite it on the outer disc.

The reproduction depth is 3".

The window on the inner disc displays the "Percentage of Original Size." In this example, the artwork will be reduced to 75 percent of the cropped size. Figures less than 100 indicate a reduced size. Figures higher than 100 mean the artwork will be enlarged. Your printing contract may stipulate maximum reduction and enlargement percentages and sizes.

AN ALTERNATIVE: THE MATHEMATICAL FORMULA

An alternative to the previously described procedures is The Mathematical Formula. This is the simplest mathematical formula:

$$\text{Reproduction Depth} = \frac{\text{Reproduction Width} \times \text{Cropped Depth}}{\text{Cropped Width}}$$

$$RD = \frac{RW \times CD}{CW}$$

EXAMPLE: Cropped Width (CW) = 2 inches
Cropped Depth (CD) = 2 1/2 inches
Reproduction Width (RW) = 4 1/8 inches
(2 columns plus an alley)
Reproduction Depth (RD) = unknown

Fill in the known measurements:

$$RD = \frac{RW \times CD}{CW} \quad RD = \frac{4 \frac{1}{8}'' \times 2 \frac{1}{2}''}{2} \quad RD = 5 \frac{1}{16}''$$

ESTABLISHING PERCENTAGES

To establish a reduction of enlargement percentage, simply divide the reproduction width by the cropped width, or:

$$\frac{RW}{CW} = \frac{5}{3}$$

In the situation above, the reproduction width of 5" is divided by the cropped width of 3" to obtain an enlargement of 167%.

The same formula applies whether enlarging or reducing.

$$\frac{RW}{CW} = \frac{2.5}{4.5}$$

In the situation above, the reproduction width of 2 1/2" is divided by the cropped width of 4 1/2" to obtain a reduction of 56%. (Figure 4-7 shows how to determine percentages using a calculator.)

Figure 4-7. Measurements and percentages with a calculator

GUIDELINING ARTWORK

After scaling the artwork, you must guideline it to tell the printer what to do with it. The guideline is a notation that you write on the back of the artwork. It includes the photo/art slugline, the reproduction width and reproduction depth, and percentage of enlargement or reduction, in that order.

The formal method of writing artwork guidelines resembles the writing of a headline. When you write the artwork's guideline, the first number of the dimension identifies the number of columns or the reproduction width (in inches, picas, or local measurements). The second number identifies the reproduction depth.

EXAMPLE: 2 X 4". The first number (2) is the column width, or two columns. The second number (4) is the reproduction depth; in this case it is four inches.

Affix a piece of white paper to the back of the photograph.

Use a grease pencil or non-bleeding type of felt-tip pen to guideline artwork on the paper. Never use writing instruments which could leave an impression on the emulsion of photographic paper. Such impressions will likely be reproduced.

Proper guidelines for a photograph would look like the following:

SLUGLINE 3 X 5" 135%

SUBCOURSE NO. D10251

CROP AND SCALE A PHOTOGRAPH

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Policy considerations are spelled out but are not limited to the provisions of AR 360-5.
- T F 2. When cropping a picture of a person it is best to crop at the neck, waist, knee or other joints.
- T F 3. Normally, a 3:5 proportion is the most pleasing shape of photograph.
- T F 4. In newspaper design the cropped depth of a photograph is usually represented in picas.
- T F 5. Scaling is the act of either enlarging or reducing cropped artwork to fit in a hole on a newspaper page.
- T F 6. The diagonal method of scaling is the most accurate method of scaling.

LESSON FIVE

ESTABLISH A FIELD PHOTOGRAPHIC DARKROOM

46Q Soldiers' Manual Task: 214-176-2301

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn to supply, set up and operate a photographic darkroom under a variety of field conditions developing black and white photographic film and prints for publication.

LEARNING OBJECTIVE:

ACTIONS: Inventory and store photographic equipment and prepare a darkroom site.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: The photographic film, paper and equipment must be stored to prevent damage and the darkroom must be set up so that the photographic image taken will result in a photograph suitable for publication.

REFERENCES: The material contained in this lesson was derived from the following publications:

TEC Lesson 570-214-1098-A Develop Black and White Film

ESTABLISH A FIELD PHOTOGRAPHIC DARKROOM

INTRODUCTION

Photographic facilities, or photo labs, are used for film loading, chemical mixing, film and paper processing, photographic printing and storage. Central to the photo lab is the darkroom. Because photographic materials are light sensitive, they must be handled in total darkness or in subdued or filtered light. Darkrooms must be designed to provide for efficient work in the dark and to ensure safety of the workers.

During exercises or operations, public affairs personnel will go to the field with their units. During deployment, they often send the exposed rolls of film back to garrison for processing. However, they may, as part of their mission in the OPLAN, be required to set up and operate a field photographic darkroom. The PA annex to the OPLAN should include instructions on what supplies should be brought, how materials will be resupplied, how the darkroom should be manned, how the darkroom should operate, and liaison procedures.

At the end of this lesson you will be able to pack photographic equipment and supplies, set up the darkroom at the field site and operate the darkroom.

PA ANNEX TO THE OPERATIONS PLAN

The peacetime Army of today is in a go-to-war posture. To support this mission, your public affairs office should be prepared for deployment at all times. There must be a PA annex published for every OPLAN. In the PA annex should be instructions for setting up and operating a photographic darkroom in the field to support the command. The photographs you develop and print in the field are used for publication release. There must be standards and procedures established to ensure you get a quality photographic product. The annex should include instructions for the following:

SUPPLIES PACKING LIST

Include in the list requirements for film, paper, chemicals, equipment and supplies, depending on the mission. The

supplies should be packed or stored prior to deployment so that they are available when you are ready to deploy. You may need to include a requirement to bring containers of water if you will travel by ground transportation (the water is too heavy to transport by air). Further in this lesson there is a section on packing, to include a recommended packing list.

FIELD DARKROOM SITE LOCATION

The PA annex should state that a fixed site with running water that can be made light-tight is the optimum site for the darkroom. Other options should be listed besides fixed sites (such as a scratch-built or tent darkroom). The annex should include instructions to the headquarters commandant (or whoever decides who gets what at an exercise site) to provide a tent, or part of a tent, for use as a facility in case no fixed site is available. By listing site requirements and the type of facility needed, the annex will assist a site survey team or advance party in locating a darkroom site. Remember, however, that PAO requirements are "low on the totem pole" and you may need to be aggressive in making your needs known.

MANNING REQUIREMENTS

Establish what personnel will be required to support the mission and man the darkroom. Plan for taskings, if needed.

ESTABLISH LIAISONS FOR SUPPORT OR RESUPPLY

The field darkroom may require support from other units or organizations, especially since it will need a source of water, and, in hot weather, refrigeration. If deploying with intelligence or signal units with photographic capabilities, plan to share facilities. The annex must address resupply actions.

STANDING OPERATING PROCEDURE (SOP)

In addition to a PA annex, you should write an SOP giving detailed instructions on how to operate the field darkroom. You can include the following in an SOP:

Establish Procedures for Setting Up the Darkroom

Include instructions on how the darkroom should be laid out for ease in operation. Instruct how to set up the enlarger

and safe lights so that they work properly. List the procedures for testing the darkroom.

Supply Storage Procedures

Include instruction on the storage of chemicals, film, paper and equipment to lessen the chance of damage. The SOP should include instruction on chemical disposal.

PRACTICE DARKROOM USE

It may be a good idea to practice setting up and using a field darkroom at the normal peacetime location once or twice a year. If the darkroom is used for a week, most problems would show up and could be worked out before deployment.

PACKING

The items you choose for packing should be chosen for the job. Because you may not know much about the site you will be deploying to, the items you bring should be versatile. Film that is versatile when used in different levels of light, lenses that will give you a variation of magnification and paper that develops an image quickly and with a short washing time will prove most useful when you must work in the field.

Once you pack for deployment, you cannot just leave the items lying in storage until you need them for a deployment. You should check the stored items at least monthly to be sure the items are in good condition. Make sure that film, paper, chemicals, batteries and other supplies are fresh, their original seals intact. Rotate after six months; put the stored items into daily use and replace with new supplies.

Some items, such as the enlarger, may or may not be kept stored for a deployment, based on whether they are needed for day-to-day operations. If this is the case, you should check the storage cases for the items and any spare parts the equipment may have. Film should be placed in a refrigerator or freezer so that it lasts well beyond its expiration date, and taken out when needed for deployment. Above all, soldiers that will be using this equipment in the field must be familiar with the equipment and know how to use it.

PACKING LIST

The following is a basic packing list of items you will need when you deploy. For containers you will need two footlockers, a case for the enlarger and at least one camera bag. This list is only a guideline because your mission and available equipment might require exceptions.

Inventory the items as you pack them, and clearly mark them as your office/unit's property. Tape a copy of the inventory list onto the inside of the lids of the footlockers. Wrap the film and photographic paper in waterproof bags, such as plastic garbage bags, to keep out moisture. If you are deploying to a desert environment, you may want to bring liquid chemicals that require only dilution. Remember that if they leak everything in the footlocker could be ruined.

Footlocker No. 1

- o One-month supply of basic darkroom supplies.
- o Film. 100 rolls of 400 ASA/ISO black and white film and 20 rolls of color slide film.
- o Photographic paper. 1,000 to 2,000 sheets of variable contrast photographic paper. Cut 8x10 inch paper to 5x7 inches before storing it for deployment use. You use 5x7 paper to conserve chemicals, paper and water.
- o Film development chemicals. Store enough developer, stop bath, fixer, hypo-clearing agent and wetting agent to develop the film.
- o Paper development chemicals. Store enough developer, stop bath, fixer and hypo-clearing agent to print the photographs you will take in the field.
- o Miscellaneous supplies.
 - Negative sleeves.
 - Dodging and burning tools.
 - Anti-static brush.
 - Grain magnifier or other focusing device.
 - Lens-cleaning tissue and fluid.
 - Blower brush.
 - Printing filter set.
 - String and clothespins.
 - Film/paper dryer and dryer bag.
 - Masking tape.
 - Black electrician's tape.
 - Duct tape.

- Film changing bag.
- Extra enlarger bulbs of 110 and 220 voltages.
- Multivoltage hotplate and immersion heater.

Footlocker No. 2

- Four trays. For developer, stop bath, fixer and wash, at a minimum. You should also pack a replacement tray and a tray for a water bath, if used.
- Four graduated beakers.
- Film-development tanks.
- Film-development reels or ribbons.
- Bottle opener.
- Scissors.
- Two or three thermometers.
- Film washer.
- Paper safe.
- Cans of compressed air (such as Dust-off).
- Contact print easel.
- Print easel.
- At least two safelights, matching the power source at the field site, with plug adapters, if required.
- Tongs.
- Sponges.
- Paper towels.
- Broom and mop.
- Tools. A hammer, nails, screwdriver, screws, regular pliers, needle-nose pliers and extension cords.
- Caulk.
- Clear plastic bags.

Enlarger

If you do not need the enlarger for day-to-day operations, you could pack it in its original container, a machine storage crate or have the post engineers build a shipping crate. Keep the enlarger in storage with the footlockers. You should periodically remove it from its container and check it for damage. Otherwise, you must prepare the enlarger for shipping when you are preparing to deploy. Check the crate or container to make sure it is not broken or damaged, and that it will close and lock. Make sure the container is marked with your office identification. If the container checks out, carefully disassemble the enlarger and pack it in the container. Be particularly cautious when packing the optical system of the enlarger. The optics can be easily scratched or broken by mishandling. When packing, include the manufacturer's instructions for assembling the enlarger.

Tables

Prepare two tables for transportation; one for use on the "dry side," the other for use on the "wet side" of the darkroom. The table for the dry side should be sturdy enough to support an enlarger. The table on the wet side will be used for the darkroom trays. The PA annex could include coordination instructions for the site survey team to locate, if possible, a field darkroom site with a sink or table already in place. You may eliminate the need for bringing the "wet" table if an adequate sink or table already is in place at the field site, but count on bringing the tables.

Camera Bag

If possible, store at least two camera bodies with short, medium and long lenses, an electric flash unit, filters, lens-cleaning tissue and fluid, a blower brush and split-beam card (an index card that can be used to split the beam of the flash) in a camera bag for use during deployments. You should periodically check the cameras, lenses and flash to make sure they operate properly. Keep a supply of freshly charged batteries in the camera bag, at least enough to last a month. If you cannot keep a full camera bag ready due to day-to-day operations, pack the camera bag with as much as you can spare, and just load it with the additional items prior to deployment. You may want to place a few rolls of film into the bag to take photographs of units as they travel with you to the field.

DEPLOY

The footlockers, tables and enlarger case are packed and locked, ready for loading to take to the field. Load the van, truck or pallet, securing the footlockers and enlarger case with tie-downs to reduce damage. If the items will be loaded onto an aircraft, you will probably be told to bring them to a central location for loading onto pallets. Soldiers or airmen trained in properly loading an aircraft will load your items; if the items will not be flying on the same aircraft as you, be sure to find out which aircraft they will be on. Make sure you can read the identifying marks on each item so that you can find them when they are off-loaded. Carry the camera bag with you; this will protect it from damage and secure it against theft or loss, and you can photograph the soldiers on their way with you to the field. Make sure to get a copy of the lading of/for shipment.

THE FIELD SITE

At the field site, unload the darkroom equipment and supplies and place them away from bright light and moisture while you prepare the field darkroom for operation. There are three types of darkrooms you can establish: scratch-built, tent and fixed site.

SCRATCH-BUILT DARKROOM

If there is no fixed site available and you do not have a tent, you could build your own darkroom. This must be identified before deployment so you could bring building materials, or get them issued to you once at the site. Locate the darkroom, if possible, near a source of water and electricity. The darkroom should be large enough to hold you and the two tables you brought, giving you room to work (Fig. 5-1). Separate the tables so that you have a "wet" and a "dry" side. Or, you may want to build shelves to place the trays on. Try to assemble the 2x4s and plywood so that they fit tightly and allow little light to leak in. Use caulk to fill in the cracks. You could either fashion a door out of wood, or you could use a blanket or shelter-half. Cover the roof with shelter halves or plastic bags; they will probably protect the darkroom from moisture during a light rain, but could be useless in a downpour.

Figure 5-1. Two examples of laying out a darkroom.

Once the darkroom is built, go inside, wait for your eyes to adjust, and check for light leaks. You will probably have leaks where the wood meets; putting in a few extra nails

along an edge of plywood will tighten it down and cut down on the amount of light coming in. On the inside of the darkroom, use black electrical tape and the inside of film paper boxes to block out any last light leaks. If you still see leaks and feel that they will cause the film to fog, use a film changing bag to load the film onto reels and into the developing tank, or use the darkroom to develop film only at night. You can sweep and mop the scratch-built darkroom if you lay a plywood floor.

TENT DARKROOM

A tent darkroom will probably be more weather-tight than the scratch-built darkroom, but may be just as difficult to make light-tight. It will help to place the tent where it is naturally shaded from the sun, by trees or in the shadow of a building or cliff. Camouflage covering will cut down on light reaching the tent, and will make it cooler and less dusty as well. A tent liner will trap light also. You may be able to make the tent dark enough to print during daylight, but most likely you will have to wait until it is dark. To develop film, either wait until it is dark, or use a film changing bag. If you do not have a film changing bag, you can fashion one from your field jacket. Snap and zip the jacket, tie off the bottom and neck and put your arms through the sleeves to work.

FIXED-SITE DARKROOM

A fixed-site darkroom is the optimum facility, especially if it has electricity and running hot and cold water. To set up a fixed-site darkroom for operation you would clean it, make it light-tight and turn on the electricity. Cleaning, power and darkness is easier to achieve than in the tent and scratch-built darkroom facilities because:

- o Cleanliness. Because a fixed-site is in a building, dust, moisture and dirt can be controlled.
- o Power. You can usually expect electricity at a fixed-site. In many instances, you may work in a vented washroom or bathroom (which will give you running water as well).
- o Light control. The fixed-site darkroom can be made quite light-tight. Although the room may appear absolutely dark at first, it may in fact be unsafe for handling unprocessed film. To check for light leaks, close the door, place a white piece of paper on the table in front of you and turn out the lights. If, after 30 seconds, you cannot discern the paper, your darkroom is light-tight.

Ventilation openings, windows, cracks around the door and even the ceiling could be a source of light leaks. Use black cardboard and duct tape to mold a vent cover that allows ventilation but eliminates the light (black cardboard is available from the empty boxes of photographic paper). Use duct tape to seal cracks around the door, windows, or anywhere else that light comes in.

SET UP ENLARGER

Set up the enlarger by the manufacturer's instructions. Check to make sure there has been no damage. Clean the optics, being careful not to scratch the glass. Ensure the darkroom's power source is compatible with the enlarger and timer, whether 110 or 220 volts and 50 or 60 kilohertz. Test the timer by setting it for several seconds and checking it against your watch. Make sure the light bulb works; if not, replace it with one of the extra bulbs you have brought. Check the aperture settings from lowest to highest, making sure the aperture moves easily without sticking or jamming. Once you are satisfied that the enlarger works properly, dust it and cover it. When not in use, always unplug the enlarger and keep it covered.

SET UP SAFELIGHTS

Check your safelights to make sure they work and have not been damaged. Place both safelights on the wet side of the darkroom within reach of an electrical outlet. The method of hanging them up will depend on how your darkroom is made. If you have built your darkroom out of wood, you could nail your lights up. If your darkroom is in a tent, the lights can be suspended from the tent poles. A fixed facility may already have nails in the walls for hanging your lights. When hanging the lights, make sure they are placed so that you can reach them in the dark and turn them on and off easily.

STORE SUPPLIES

Retrieve your supplies, unpack them and store them off the floor, away from dampness and light. Separate your storage into three areas: one for chemicals, one for film and paper, and one for cameras and accessories.

Chemical Storage

Chemicals should be stored in a cool, dark, dry place. They must be stored carefully both before and after mixing. The containers used for shipment of liquid chemicals should make excellent containers for storage. The containers should be arranged so that as little damage as possible occurs if any container is accidentally broken. Do not store dry chemicals on the floor; dampness, leaking liquid chemicals, overflowing sinks or rainwater could damage them. Store them on a shelf or a pallet. Liquid chemicals should be stored lower than dry chemicals, so that if a container leaks the contents will damage only the floor.

Film and Paper Storage

Proper storage should be maintained if you expect good photographic results. Photographic film and paper are perishable. Poor storage conditions can cause the photographic properties of sensitized materials to deteriorate. Adverse storage conditions may cause changes in color and tone reproduction, and the speed of films and papers. Color materials are more seriously affected by heat and moisture than black and white. You must protect them from the harmful effects of heat and moisture.

Temperature. Normal room or outdoor temperatures are easily withstood; storage at 65 degrees F is adequate for conventional materials when there is a reasonably rapid turnover of stock. A moderately high temperature for a short time is not particularly destructive, but extended storage at high temperature causes the film to fog. Do not store film or paper in hot, unventilated storage rooms or lockers, in the direct sun or under bright lights. If possible, freeze or refrigerate the film and paper.

Humidity. Humidity during storage becomes a problem once the package seal is broken. Hot, humid air may cause fog, fungus growth, condensation, mold and mildew. The enlarger could rust from humidity.

Ideally, storage during high temperature and humidity should be in an air-conditioned room with relative humidity between 40 and 60 percent. If an air conditioner is not available, seal film and paper into plastic bags to keep out moisture and place them in a refrigerator. Check with medical, mess or commo units in your area. They may have air-conditioned or refrigerated space where you may store your film and paper. Otherwise, seal the film and paper into plastic bags and do the best you can in the field to store them away from water, heat and light.

Camera Storage

The camera bodies and accessories should be stored in the camera bag. At the end of each day, or before each assignment, load the bag with enough film to accomplish the next day's assignments. Before using the film, if refrigerated, allow it to come to room temperature in its unopened package, which will prevent moisture condensation. Cameras should always be loaded with film, ready to go. Check each item for cleanliness, maintenance and serviceability before an assignment.

MIX CHEMICALS

If you must mix dry chemicals for stock, do so, following the manufacturer's instructions. Otherwise, dilute the liquid chemicals as needed.

OPERATE THE FACILITY

Your field darkroom is now established. Clean it, and make sure that you can secure it. Do not forget to use a sign indicating that the darkroom is "in use" if others are able to walk in on you as you work.

You are now ready to develop black and white film in your field photographic darkroom. The steps for the black and white process are contained in TEC Lesson 570-214-1098-A, Develop Black and White Film.

Run a test roll of unexposed film through the development process as a test of the darkroom. Do NOT use a roll of film that has been exposed. The film should come out clear, with frame numbers and film information along the bottom edge. If the film is fogged, you probably have a light leak. If the marking on the edges is missing, something is wrong with the chemicals, probably the developer.

Contact the liaison(s) established in the PA annex to the OPLAN. Should the deployment be lengthy, a liaison with higher headquarters, sister units or a depot for resupply of photographic materials will be very important. You may consider locating a local civilian photographic supply source if necessary.

ADVERSE WEATHER OPERATIONS

Most likely you will go to the field when the weather is less than perfect. You should be prepared to operate the field photographic darkroom in any type of weather. This chapter will cover operations in cold, heat and humidity.

COLD TEMPERATURES

Cold temperatures are found year-round in the polar regions, on high mountains, and during the winter in temperate areas of the world. Because the possibility exists that you will participate in exercises in cold temperatures, you must be aware of how cold weather affects your equipment.

Cold Weather Equipment Preparation

Cold weather can make your SLR camera malfunction if the temperature is low enough to cause the mirror to stick, the shutter to break and the aperture to freeze open or shut. The film could also break when being wound. Synchronization cords will be less flexible and may snap, damage that may not be noticed. Take the following precautions to protect your film and equipment in cold weather:

- o Prevent moisture condensation. Condensation is formed when cold objects are brought into contact with warm air, and the moisture can freeze when the objects are brought back into the cold. Although the moisture can be wiped off the outside, it can penetrate inside the equipment and cause permanent damage when it freezes.
 - Never place cold film in a warm camera, or warm film in a cold camera.
 - Carry the camera in a plastic bag to keep out moisture which might freeze when you go outdoors.
 - Do not breathe on cold lenses or eyepieces; it causes a fog that forms frost on cold glass and metal that is difficult to remove.
- o Keep the lenses and camera covered.
 - Use a UV haze filter as a protective cover at all times to prevent frost damage and to prevent the lens barrel from filling with snow.
 - Careless removal of snow or frost that does form can result in lens damage.
 - Keep the camera covered when not in use to prevent dustlike snow particles from entering the camera mechanism and causing damage.
- o Static electricity. Reduce static marks on your film by winding and rewinding the film in the camera very slowly, and onto the development reel as well.
- o Batteries.
 - Batteries lose power rapidly in cold weather.

- Use fresh batteries; they will hold a charge better than older ones.
 - Use body heat to keep batteries warm so they will work better and last longer.
 - Carry spare batteries in a warm pocket.
 - Carry batteries for your flash close to your body in a battery pack.
 - Store the batteries in a warm place when not in use.
- o Warm water before use. Cold temperatures slow down chemical processes. Use a field stove, hot plate or immersion heater to warm water before mixing the chemicals.
 - o Adjust film use to the cold. At low temperatures, film becomes brittle and stiff, and cracks occur in the emulsion.
 - Handle film gently when winding it on the take up reel or developing reel.
 - Adjust f/stops and exposure time because the reaction of film to the exposing process is slowed, reducing film speed.

HOT TEMPERATURES

Hot, humid weather is bad for photographic equipment, causing corrosion, fungus growth, insect damage, rust, mildew, mold and warping. Photographic film and paper, when stored under hot, humid conditions, will deteriorate. Some crystalline chemicals will absorb the moisture and dissolve in it, or give up their own moisture to the air and become powdery.

Hot Weather Equipment Preparation

Try to store your film, paper, chemicals and equipment in a cool, dry place. Use any of the following suggestions open to you to keep your equipment and materials in good shape:

- o Keep darkroom cool.
 - Locate in-shade, use fans or air conditioners when available.
 - Seal film and paper in a plastic bag and store in a refrigerator.
 - Freeze containers of water in the mess hall daily and place them in storage with film and paper.
 - Operate darkroom at night if daytime temperatures are too high.
- o Keep equipment, chemicals, film and paper dry.

- Store crystalline chemicals in brown glass or plastic bottles sealed with wax or tape at the neck.
 - Keep the film and paper, and especially color slide film, sealed in their original packaging as long as possible; open them just before use.
 - Once the packages are opened, seal film and paper in plastic bags.
 - Place a desiccating agent, such as silica gel, in the bags of film and paper to absorb moisture.
 - Clean and dry equipment before storage.
- o Process film quickly. Film, especially color slide film, should be processed as soon as possible after exposure. This will avoid shifts in color balance, fading of the image and fogging.
- o Inspect regularly.
 - Inspect photographic equipment and materials weekly for dust, corrosion, mildew, insect damage or fungus growth.
 - Keep the darkroom as clean as possible.
 - All exposed metal parts should be covered with a corrosion/rust preventative such as WD-40, or even the anti-corrosive oil used on weapons.
 - Leather should be treated with leather dressing.
- o Protect equipment.
 - Protect lenses from scratches caused by dust, sand or prop wash.
 - Protect a lens with a UV haze filter at all times, and with a lens cap when the camera is not in use.
 - Waterproof the camera by placing it in a clear plastic garbage bag, with holes cut for the lens and eyepiece. Seal the bag against the camera with electrical tape. The bag should be loose enough for you to operate the camera from the outside.
 - Avoid dropping the camera into water.
 - Keep the camera and the enlarger covered when not in use.
- o Use proper water temperature. When temperatures are high, it may be difficult to obtain water between 65 degrees and 75 degrees F for film and print development. At water temperatures above 75 degrees F, developer could fog or stain from rapid oxidation, and gelatin could swell, causing reticulation (wrinkling).

You can use the following to cool the water used for processing (not necessarily used as water for processing):

- Ice (from the dining facility or aid station).
- Melted ice.
- Air conditioner run-off
- Heat exchanger run-off
- Air compressor run-off
- Cool water from any other source.

Conserve Water

If in a desert environment, water may not be available except for consumption and hygiene. Because large quantities of water are essential for photographic processing, you should examine your operation for ways to economize your water usage. If possible, bring containers filled with water when you deploy. Use liquid chemicals versus dry. Use resin-coated paper, which requires a shorter washing time than fiber-based paper. Follow manufacturer's instructions for processing and washing film and paper, using the minimum time listed. Consider the following when water is scarce:

- o Sources of water. If there is a shortage of fresh water, you may need to reuse water. It is safe to assume that water is satisfactory for photographic washing if it is clear, colorless, and does not have a sulphur odor. Filter debris out of the water and bring it to the temperature needed for processing. You can use water from:
 - Air conditioners.
 - Heat exchangers.
 - Refrigerator units.
 - Ice or melted ice.
 - Mess facilities.
 - Shower facilities.
 - Seawater.
 - Any other water source, potable or non-potable.
- o Use hypo-clearing agent. Hypo-clearing agent is a fast and efficient means of removing residual hypo in black and white film. Seawater is also an efficient remover of hypo in film. If you use seawater for washing film, you must remove the salt with a final wash of at least five minutes in fresh water.
- o Reduce water use.

- When developing film, use the slowest rate of water flow and the smallest tank that will accommodate it.
- Develop enough rolls of film to fill a developing tank.
- Save water used from film washing and use for print washing.
- When printing, reduce unnecessary water depth in washing trays.
- Paper cut into one-inch strips can be used to test exposures; the strips will conserve both water and chemicals by reducing trial prints.
- Use replenishers rather than dumping exhausted chemistry and mixing fresh.
- Avoid making prints 8x10-inch and larger.
- Make contact sheets to avoid printing bad negatives.

Conserve Chemicals

Some chemicals can be reused many times before they become exhausted. Once chemicals are exhausted, dispose of them according to local SOP.

- o Developer. Most developers are for one-time use only and must be discarded. Some are reusable; follow manufacturer's instructions if reusing developer.
- o Stop bath. Stop bath is reusable. Most require keeping track of how many rolls of film have gone through. Kodak's Indicator stop bath turns purple under safelights when exhausted. It can be recycled as long as it remains yellow.
- o Fixer. Fixer can be used for a long time before it becomes exhausted. Pour the used fixer into a container separate from the unused fixer to use once the unused fixer is gone. Follow manufacturer's instructions to tell when fixer is exhausted.
- o Hypo-clearing agent. Hypo-clearing agent can be discarded after use.
- o Wetting agent. Wetting agent can be discarded after use.

PRACTICE EXERCISE

LESSON 5

SUBCOURSE NO. DI0251

ESTABLISH A FIELD PHOTOGRAPHIC DARKROOM

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The camera bodies and accessories should be stored in the camera bag.
- T F 2. The enlarger should be packed without disassembling it.
- T F 3. Photographic film and paper are perishable.
- T F 4. Dry chemicals should be stored on the floor below the liquid chemicals.
- T F 5. Cleaning, power and light control is easier to achieve in a tent.
- T F 6. Seawater is an efficient remover of hypo in film.
- T F 7. In the field you should avoid making contact prints in order to save water.

Army Public Affairs Center
Fort George G. Meade, Maryland

10 Credit Hours

Edition Date: March 1991

SUBCOURSE OVERVIEW

We designed this subcourse as part of the Broadcast Journalist course to introduce you to an entry-level understanding of Electronic News Gathering/Electronic Field Production Equipment, Lighting For Electronic News Gathering, Framing And Composition, Video Scriptwriting and Electronic Editing. This subcourse is presented in five lessons.

You must have a basic knowledge of military broadcasting prior to taking this subcourse. There are no prerequisites to this subcourse.

This subcourse reflects the doctrine current at the time the subcourse was prepared. In your own work situation, always refer to the latest official publications.

Unless otherwise stated, the masculine gender of singular pronouns is used to refer to both men and women.

TERMINAL LEARNING OBJECTIVE

- ACTION:** You will learn the basics of electronic news gathering/electronic field production, lighting for electronic news gathering, video scriptwriting, framing and composition, and electronic editing.
- CONDITION:** You are given the material presented in this lesson.
- STANDARD:** To demonstrate competency of this task, you must achieve a minimum of 70 percent on the subcourse examination.

LESSON ONE

ELECTRONIC NEWS GATHERING/ELECTRONIC FIELD PRODUCTION

46R Soldier's Manual Task: 214-177-1315

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of Electronic News Gathering/Electronic Field Production (ENG/EFP) and the equipment necessary to perform these functions.

TERMINAL LEARNING OBJECTIVE:

ACTION: After you complete this lesson you will be able to describe common ENG equipment, its purpose and its functions.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from the following publication:

STP 46-46Ri4-SM-TG Soldier's Manual & Trainer's
Guide, Broadcast Journalist, MOS 46R Skill
Levels 1/2/3/4/, August 1988

ELECTRONIC NEWS GATHERING/ELECTRONIC FIELD PRODUCTION

INTRODUCTION

The age of the high-quality, portable "mini-camera" is here to stay. The same technology found in the pocket calculator and the computer is responsible for small, lightweight video systems, which are revolutionizing the television industry. Where once we could only take a film camera, the Electronic News Gathering (ENG) /Electronic Field Production (EFP) videotape camera has effectively replaced this older system with cost-effective, portable news gathering equipment. Not only is it portable, it can even allow the broadcaster to play back the recording on the spot and gain instant confirmation of success or failure. With the older film format, the process was time consuming, and expensive.

This subcourse discusses the equipment, operation and capabilities of the small-format video camera system. As an Army broadcaster, you will be dealing extensively with ENG/EFP recording systems used primarily for command information and electronic news gathering. You need to have a basic understanding of the mini-cam system, as well as television in general to perform effectively in your position either as a field reporter or producer of command information material. This subcourse will give you the basic knowledge required to function in these positions.

Commercial television stations use many different terms to describe their mobile production units. However, civilian and Army broadcasters agree on the use of at least two terms: ENG and EFP. There is a difference.

- o ENG is the coverage of uncontrolled events such as a training accident or fire. The pictures and story are gathered on the scene, as the events take place.
- o EFP uses the same equipment, but under controlled circumstances. A story or script is written in advance. The event is carefully planned and executed until the final product is finished with predetermined results.

ENG/EFP serves two primary purposes in Army broadcasting. They are command information and public information, which will be anything from an uncontrolled event to a carefully planned event. Either could be a news story, in which case, it would be treated the same as ENG, or a produced spot on the other end of the spectrum. Most likely it will fall somewhere in between. EXAMPLE: A training exercise where the event itself is planned, but your coverage of it will be with less control than an EFP.

Most of today's soldiers grew up with television. The last war, Vietnam, came into America's living rooms through television sets. The ability of television to communicate information and ideas by using pictures as well as words far outdistances other media. With all its advantages, however, television poorly produced can lose the audience's interest and attention just as any other medium. You, the broadcaster, must learn, practice and properly employ television production techniques to be most effective in ENG/EFP.

Since television is normally a team effort with every member concentrating on his specialty, the ENG team faces a far greater challenge in that there are fewer members to accomplish all of the tasks necessary to complete the production. In addressing the different aspects of television production it would be simple to concentrate in one specific area with regards to one specific task. However, since the ENG team member must wear many hats, it will sometimes be necessary in this lesson to refer to certain topics in a number of different places. For that purpose, this lesson will explain each facet of the subject, and label it in bold type in order for you to find it more easily whenever it is referred to again. There will be different size letters in bold type to indicate topics and subtopics. It may be necessary for you to refresh your understanding of a particular topic by going back when you find it mentioned again. Don't hesitate to do so.

THE CAMERA

The most obvious production element, the camera, comes in many sizes and configurations. Each has three main parts, the body, the lens and the viewfinder. Some cameras may be easily carried and operated by one person, while others are so large and heavy they must be placed on a special camera mount or **dolly pedestal**. The camera dolly is wheel mounted, enabling the operator to move the camera through a studio, on wheels, with relative ease. However, the chance of you being involved in an EFP requiring studio cameras, is extremely remote. Therefore, the camera we will discuss is the portable camera, the most often used in ENG/EFP.

Whenever possible ENG/EFP cameras should be placed on a **tripod**. A tripod is a stand with three legs having a mounting plate to which the ENG/EFP camera is attached. It is the field equivalent of the studio dolly pedestal. ENG/EFP cameras are automated and fully operational within seconds after switching them on. Adjustments to extreme production situations may be made quickly and easily (see Figure 1-1, Basic Camera).

Almost all important productions are done with color cameras- Black and white cameras are used for inexpensive taping, surveillance, and industrial applications.

FIGURE 1-1. BASIC CAMERA

HOW THE CAMERA WORKS

All TV cameras, whether color or black and white, studio or portable, operate on the same basic principle. They convert an optical image into electronic information that is then reconstructed by a television set or monitor into visible screen images.

Black and White Camera

The light reflected off an object is gathered by the lens and focused on the camera pickup device. The light is then transformed into electrical energy or the video signal. In the black and white camera, this light stays in the form of different values of gray. The signal is amplified, processed and converted back into images in the viewfinder.

Color Camera

The color camera is more complicated than the black and white camera. In order for you to understand the dos and don'ts of color production, you'll need to know some of the basic workings of the color camera body. Since the camera is a seeing device and requires light, you'll also need to know something about light which will be discussed in another chapter. In this chapter, we will briefly discuss internal optical systems, image devices, electronic characteristics of color cameras, camera types and operational characteristics.

The color camera first splits the white light entering through the lens into the three primary colors; red, blue, and green. Those colors are then processed into separate channels. The color separation device that splits the white light is called the beam splitter.

Electronic characteristics. The electronic characteristics of a camera depend primarily on the performance of the image device used. In discussing internal optical systems and image devices, we'll take a brief look at color response, resolution and operating light level.

Color response. Ideally, the camera should respond to all colors alike. In the past, however, it's been difficult to reproduce different colors with the same accuracy. The greatest difficulty has been encountered when reproducing red. Not only is it difficult to produce a strong video signal for red, but it also has a fuzzier image than other colors. In their attempts, manufactures have gone to special tubes for each channel and special color-correction filters and electronic circuits. For the moment, the battle for accuracy in color response is being waged most successfully between the Saticon tube and the Charged Coupled Device or CCD. The COD is an integrated circuit or chip. Keep in mind that color response is the reproduction of color in the form of an electronic signal, and not the seeing or separating of the color by the beam splitter.

Resolution. The camera pickup device, tube or chip, is the principal element in the camera that determines the sharpness of the picture. Other elements that influence the resolution of the picture are the lens, the quality of the internal optical system, and the TV set or monitor that reproduces the picture. For instance, take a magnifying glass and look at a photo that is reproduced in a newspaper. Then look at one reproduced in a slick magazine. Generally you'll notice that the newspaper picture consists of rather coarse dots, whereas the individual dots are barely discernible in the magazine picture. The newspaper picture has poorer resolution than the magazine picture.

Be conscious of the limited resolution of the TV picture, especially when dealing with television graphics and in areas of production where fine picture detail is essential.

Operating light level. As previously mentioned, the camera converts visual images into an electronic signal for processing to video tape or transmission in some form or another. The first step in the process is accomplished by the pick-up device in the camera, whether it be a tube or chip. A certain amount of light is necessary for the pick-up device to be able to perform its task. The ENG/EFP videographer must make sure there is enough light to meet this technical requirement. There are a number of different aspects of light and a number of different ways to measure them. One common unit of measure that pertains to the amount of light, is the footcandle. Whatever term is used, it's important that your light-measuring device be in the same language as the manual for your camera. **EXAMPLE:** If the manual for your camera calls for a minimum of 100 footcandles of light, you'll need a light meter that reads in footcandles. It's not important for you to know what a footcandle is other than that it is a unit of measure. It is important for you to know "how much light your camera requires to operate."

Since cameras must operate under varying light levels, portable video cameras have a means of boosting the light. In reality, after the light, or optical image, entering the camera has been converted to an electronic signal, that signal is boosted rather than the light itself. Generally, the camera has a dB gain switch with two positions. They are 9dB and 18dB. For every 6 dB of gain, the camera output signal will double in amplitude, effectively increasing the video level. That means the 9dB setting will triple the signal strength while 18dB will be times eight. **CAUTION:** Video noise increases in proportion to the video gain.

Video noise. Under low light levels, even the best cameras cannot avoid noisy pictures. A noisy picture has a great amount of snow, or white vibrating spots in the picture. This occurs when the video signals, produced by the pickup device, are not strong enough to override the electronic interference that the system usually generates. At 18dB gain, the system is generating more electronic interference, therefore, more video noise.

Lag. Lag and/or color distortion occurs under low-light conditions when a bright object moves against a dark background, e.g., a white glove moving against a dark background. The white glove will leave a streak or trail against the background, sometimes called "comet tailing." Comet tailing occurs when the camera pickup tube(s) is unable to process "video hits," extremely bright highlights that reflect off highly polished surfaces. You may have

observed what appears to be red flames that seem to trail shiny brass objects whenever they move across a brightly illuminated area. In either case, the white glove on the dark background or the extremely bright highlights, it's a contrast or difference between that one spot and the area of the picture around it. It takes an instant for the picture to darken back down where the brighter object was. It's the camera's pickup device doing the same thing the human eye does when a moving "sparkler" appears to leave a bright line behind it as it is moved around. Of course, the video camera cannot react as quickly as the human eye, thus the same effect occurs in less extreme situations.

Color distortion. Color distortion occurs under low-light levels and makes colors like blue look green, and red look orange, etc.

BODY

The camera body consists of the housing and internal parts. That includes either camera pickup tube(s) or a solid-state image device and the internal optical system. The internal optical system is a series of prisms or mirrors. There are also circuitry boards, resistors, capacitors and wires. You might say that the camera body is the part which translates video images into electronic signals for processing and shipment.

VIEWFINDER

The viewfinder on a portable camera is a relatively small TV screen (1.5 inches in diameter), while a studio camera viewfinder is larger (3 to 9 inches in diameter). They both produce high resolution black and white images. The TV screen on a portable camera is shielded from outside reflections by a flexible rubber eyepiece that adjusts to the operator's eye. In that rubber eyepiece, there is an adjustable lens to focus since the eye is placed within an inch or two of the screen. The studio viewfinder uses a hood to shade the TV screen from overhead studio lights.

The portable camera viewfinder contains a number of control lights or displays that indicate the status of certain camera functions. Most viewfinders automatically display information on tape status, battery condition, tally/record light and low light level indicator. The viewfinders display, on command, bars (color bars), patterns, white/black balance setup cursor, and camera registration. (All camera viewfinders are black and white.)

Many cameras permit the viewfinder to be used as a playback monitor for the VCR. The advantage of this feature is that

you don't need any other equipment to set up the camera. This function is called video return, and more systems are getting away from it. Camera's are more reliable, recorders have indicators to let you know when you're recording, and video return becomes less cost efficient.

LENS

The lens selects a certain field of view and produces a small, clear optical image of this view. The lens and certain attachments are sometimes called the external optical system.

With the lens we have four primary concerns. These are (1) focal length, (2) focus, (3) f-stop, and (4) depth of field.

Focal Length

Focal length is the distance from the optical center of the lens (which is not always its physical center) to the point where the image as seen by the lens is sharp and clear, or in focus. Portable television cameras have a zoom, or variable focal length lens which enables them to select fields of view at different distances from the camera without moving the camera. It allows you to change the focal length of the lens from long to short or from short to long in one continuous operation. A complicated series of lenses interact and keep the object in focus at all times during the zooming process. Zooming in means changing the lens gradually from a wide-angle lens to a narrow-angle lens. On the television screen, a zoom in appears as though the camera is moving smoothly toward the object. Zooming out means changing the lens from a close-up to a distant shot and it will appear that the camera is moving away.

The degree to which you can change the focal length of a zoom lens is the zoom range of your lens. The range is often given in a ratio, such as a 10:1 zoom range. This means you can increase your focal length ten times. Some cameras have a "times two function," which allows you to double the focal length at any point in the zoom, thus making the maximum 20:1 for the above example.

The speed at which the focal length of a zoom lens can be changed is determined by the operator, whether it is done manually or with a zoom servo.

Manual zoom control. On the ENG/EFP zoom lens, the manual control is a small rod extending from the zoom ring (see Figure 1-2). To zoom in or out, turn the zoom rod clockwise or counterclockwise. It takes some skill and practice to accomplish smooth zooms with the manual control.

FIGURE 1-2. MANUAL ZOOM CONTROL

A zoom servo is nothing more than a small motor controlled by a lever. The distance the lever is depressed determines the speed of the zoom. The range of speed can be anywhere from 2.5 to 20 seconds. The lever is called the zoom selection or T/W switch. T stands for telephoto and W for wide-angle.

There are several advantages to the servo system. Zooms are steady and smooth, especially during slow zooms. The zoom control is easy to operate and allows you to concentrate more on picture composition and focusing. The servo zoom frees the left hand to operate the manual focus and aperture controls. However, quiet as the servo motors are, they can sometimes be heard by the camera microphone and they require more battery power.

Manual/automatic focus control. The focus control is a manual function (see Figure 1-3, Manual Focus Control Ring). To operate it, the operator rotates the focus ring on the zoom lens, either clockwise or counterclockwise, while looking in the viewfinder to determine if the picture is in focus. Some cameras have an automatic focus device. Obvious problems occur when focusing not on the object that lies next to the camera, but on the one farther away. The operator will have more control in the manual mode.

FIGURE 1-3. MANUAL FOCUS CONTROL RING

Getting The Most Out Of A Lens

Generally, lenses fall into one of three categories; wide angle, normal, and narrow angle or telephoto. Since the zoom lens can duplicate all three, we will discuss the characteristics of each.

Wide Angle Lenses

Field of view. The wide angle lens has a very wide field of view and very little magnification. The principal subjects seem relatively small in relation to the background and it is difficult to distinguish much detail in these wide shots.

Perspective. These lenses exaggerate depth and distance. Objects in the foreground will appear much larger than those in the background.

Movement. The speed of subject movement will be greatly exaggerated, especially when moving towards or away from the camera. Camera movement will not be nearly as noticeable as with longer lenses. Subject movement will be very easy to follow since the wide horizontal field of view, minimal magnification, and deep depth of field eliminate camera jitter and focus problems. This lens, (or the zoomed out configuration of the zoom lens), is an excellent choice when

you are trying to follow a lot of action. There are different types of camera movement both in and out of a television studio. Since ENG is accomplished more out of the studio than in, one of those types of movement (camera positioning) becomes much more important. Changing the aim of the camera left or right, up or down, we'll call "camera movements" and physically changing the location of the camera, we'll call "camera positioning." More will be discussed about camera movement and camera positioning in Subcourse DI0351, Electronic Journalism II, but for the purpose of learning about lenses and how they effect movement, you'll only need to know whether we are talking about changing the aim of the camera, or its location.

Distortion. When your subject is too close to the lens there will be immense distortion (see Figures 1-4a and 1-4b, Distortion). In Figure 1-4a the subject's hands appear unnaturally large in relation to her body. In Figure 1-4b her body appears elongated and her head and shoulders appear unnaturally larger than normal. Wide angle lenses create barrel distortion. Barrel distortion is when vertical lines in your field of view appear to bulge outward in the middle of the videospace and to converge at the top and bottom.

FIGURE 1-4a FIGURE 1-4b

DISTORTION

Limitations. Because of distortion when the subject is too close to the lens, you will use the wide angle lens primarily for long establishing shots. Picture definition and detail will be less sharp, making it difficult for the viewer to see all objects clearly. Also, because of the extensive depth of field, you won't be able to use selective focus to your advantage. There will be more information about selective focus later under depth of field. Another limitation of the wide angle lens of great concern to videographers is its susceptibility to lens flare. The wide field of view can inadvertently include the glare from studio lights or the sun. If you're not careful you can

even get the lights or the sun in the shot itself. If your camera has pickup tubes, this will cause burn in.

Normal Lenses

Field of view. Through a normal lens, the field of view will be about the same as normal vision.

Depth of field. Normal lenses will usually give a medium depth of field with the objects in the extreme foreground and background areas of the picture thrown slightly out of focus, but with a fairly wide area of acceptable focus around the principal subject.

Perspective. The normal lens will produce a natural depth perspective with no exaggeration of foreground-to-background subject size, depth, or speed of movement.

Movement. The movement of subjects toward or away from the camera will appear at near normal speed through a normal focal length lens. Since there isn't much magnification camera movement will not be exaggerated and it is fairly easy to follow a moving subject. However, camera positioning should be kept to a minimum since the jitter and shake of a moving camera could be obvious.

Distortion. Distortion will be almost nonexistent and the slight flattening effect of the normal angle lens may be flattering to people with prominent facial features.

Limitations. There are few limitations with the normal angle lens beyond the jitter and shake seen when the camera is being repositioned. With professional camera steadying equipment, even this can be overcome.

Telephoto (Narrow Angle) Lenses

Field of view. A narrow angle lens has a very narrow field of view and powerful subject magnification.

Perspective. The long lens, or the zoomed-in configuration of the zoom lens, compresses perspective and reduces the perception of space and volume. It also makes everything in the picture appear about the same size regardless of distance. EXAMPLE: The shot from the center field camera at a baseball game is usually zoomed in and makes the pitcher and the batter appear the same size even though the batter is sixty feet further away.

Movement. Extreme magnification and narrow horizontal field of view make it difficult to follow a rapidly moving subject. The focus is so critical and the field of view so

narrow that following a subject with the aim of the camera should not be attempted unless the movement of the subject is totally predictable. EXAMPLE: Following the horse along the backstretch at a horse race. To follow a subject with camera positioning is absolutely out of the question with a long lens. The slightest movement of the camera in this fashion will be greatly magnified.

Distortion. The compression of perspective in the long lens appears to flatten everything to a point that it removes depth perception. Heat waves rising from the ground will be magnified so much as to distort images. This lens will counter your efforts to give the effect of three dimensions.

Limitations. Although the long focal length lens will bring about greater detail of distant subjects, other aspects of the picture are effected negatively. This lens should be used in special applications only.

Focus

Focus with a lens is the same thing as focus with the eye. Sharp and clear is in focus, while fuzzy and unclear is out of focus.

There are two methods of setting the focus on a zoom lens. One, called zoom focus, is by zooming all the way in and setting the focus, then zooming out to the focal length desired. Once this is done, everything in the depth of field will remain in focus for that zoomed out shot, including the object focused on, provided the distance between it and the camera doesn't change.

The other is called rack focus. This is nothing more than setting the focus on something in the field of view. When this is done, only that object and other objects at the same distance will remain in focus as long as the distance between them and the camera doesn't change. Obviously a rack focus is used when there isn't time to zoom focus. There are times when the effects of a rack focus may be desired. EXAMPLE: When the viewer's attention is directed toward something in the foreground and we wish to lead their eye to another object. We can do this by changing the focus to bring the other object into sharp focus while the first object goes out-of-focus,

f-Stop

Just as in photography the camera pick-up device will operate properly only within a certain range of light intensity. If too much or too little light falls on the pick-up tube or chip, the picture quality will suffer.

Since you will use the camera both indoors and outdoors, you will have to adjust for the extreme difference in light levels.

The lens diaphragm, or iris, is used to control the amount of light that enters the lens, and thus the camera by enlarging or reducing the aperture. The f-stops indicate the size of the lens (diaphragm) opening. The lower the f-stop number, the wider the lens opening. When a lens is zoomed in, it will require more light, a wider opening and thus a lower f-stop number (see Figure 1-5, f-Stops & Iris Openings).

Most cameras have an automatic iris that allow the operator to devote his attention to other important aspects of videography such as framing, composition, etc.

Although the automatic iris seems ideal for ENG/EFP systems, it does not always work to the operator's advantage. With a fairly even illumination, the auto iris closes down when it sees an extremely bright area in a scene, or opens up when sensing a large dark area. This will cause silhouetting. This can be avoided by switching to manual iris control and exposing for the subject alone.

It is important for the ENG operator to know that f-stops determine more than just the amount of light entering the camera. They also affect the depth of field.

FIGURE 1-5. F-STOPS & IRIS OPENINGS

Depth Of Field

If you place objects at different distances from the camera, some objects will be in focus and some out of focus. The depth of field is that area of the field of view where the objects will be in focus (see Figure 1-6). The depth of field can be shallow or great. If the depth of field is shallow, only the objects in the middle ground may be in focus; the foreground and background will be out of focus. A large diaphragm opening (small f-stop number) will decrease the depth of field and a small diaphragm opening (large f-stop number) will increase the depth of field.

It's important for the ENG camera operator to understand this, because the same rules apply when the camera is moved. A great depth of field makes it easy for the camera operator to stay in focus while moving short distances. A shallow depth of field makes it impossible to move without getting out of focus.

FIGURE 1-6. DEPTH OF FIELD

Although it seems that a great depth of field would be the most desirable in field operations, a medium depth of field is sometimes preferred, because in-focus objects are set apart from out-of-focus background. Thus, the object will be emphasized, and little attention will be drawn to unnecessary background. The foreground, middle ground and background will be better defined. The important thing for you, the operator, is to understand the basic principles and apply them properly.

Three things affect the depth of field. They are: (1) the focal length of the lens used, (2) the lens opening (f-stop), and (3) the distance between the camera and object.

- o Short lens focal lengths have a great depth of field. Long focal lengths have a shallow depth of field.
- o Large lens openings (small f1-stop numbers) cause a shallow depth of field. Small lens openings (large f-stop numbers) cause a great depth of field. A low light level will necessitate the opening of the lens diaphragms, which will cause a decrease in the depth of field.
- o The farther away the object is from the camera, the greater the depth of field. The closer the object to the camera, the more shallow the depth of field.

Some of these factors counter each other in practical application. A close-up shot with the lens zoomed all the way out (a short focal length/greater depth of field) would have a small camera-to-object distance (shallow depth of field). The same close-up shot done with the lens zoomed all the way in would have a longer focal length (shallow depth of field), but a greater camera-to-object distance (greater depth of field). With zoom lenses, the depth of field changes as they are zoomed in or out. When zoomed in, you have a shallow depth of field; when zoomed out you have a greater depth of field. Add to this, the lens diaphragm opening will increase as you zoom in and decrease as you zoom out, and you can see the need for a lot of practice.

Sometimes a limited depth of field can work to your advantage. As mentioned earlier, an out-of-focus background will not interfere with, or distract from your main subject. If there are small things in the immediate foreground they can almost be taken completely out of the picture with a reduced depth of field.

EXAMPLE: When shooting through small limbs of a tree, or a chain link fence, they will not even be seen if they are close enough and the camera is zoomed in on something far enough away.

Lenses For Effects

You will not be as concerned about lens effects for ENG as you would be for EFP. There are a few things you should know about different lenses and lens uses and the effects created by them.

Visual perspective of a zoom lens versus a camera dolly shot. There is an important difference between zooming in or out, and physically repositioning the camera closer or farther away. The wide use of a zoom lens and its ease of operation has caused many videographers and directors to rely on the zoom where they would be better served by repositioning the camera. A zoom lens simply magnifies or reduces an image but it is necessary to move the camera to get the full three-dimensional effect. This is particularly important when moving through doorways, and arches, or past furniture and other stationary objects. This movement of the camera is called a "dolly." This movement will be discussed more in the section covering camera operation.

The lens, body and viewfinder combination is called the **camera head**, because it is at the head of the chain of other essential electronic camera equipment. The camera head itself has a series of attachments and controls that help you use the camera efficiently and creatively.

RECORD/PLAYBACK SYSTEM

The video recorder, with the portable camera, offers a whole new concept in television production. Although VCRs are more complex electronically than audio tape recorders, they are no more difficult to operate. Currently, there are a number of videotape formats used in the broadcast industry: 3/4-inch U-matic, 1/2-inch Beta, Super VHS systems, and 8 millimeter, called "Hi 8." There are different schools of thought as to which are broadcast quality and which are not, but it is universally accepted that 3/4-inch U-matic and 1/2-inch Beta, are industry standard and the two formats commonly used in Army Broadcasting. Although the camcorder 1/2-inch Beta system started a revolution with its lightweight single system camera/recorder, and the other comparable systems carry it even further, choice of systems seems to be just that, a choice of systems. A basic understanding of 3/4-inch U-matic format will serve you for the purposes of editing to enable you to function in the field of ENG/EFP. Cassettes recorded on 3/4-inch VCRs are all interchangeable (Note: the 1/2-inch system is not compatible with the 3/4-inch system, and additional equipment must be used to dub from one format to the other). Besides the video track, the 3/4-inch U-matic cassettes have two audio channels, and a control track channel (see Figure 1-7)

FIGURE 1-7. 3/4 INCH UMATIC TAPE FORMAT

Most portable VCRs run on a 12-volt DC battery or AC power. Currently, batteries available have a charge life of varying lengths and, if you hook up the camera to the same battery, the life is about half. For AC operations, an AC/DC converter is necessary. With AC operation, there is no time limit but you are always tied to the length of the AC cord.

ELECTRONIC NEWS GATHERING/ELECTRONIC FIELD PRODUCTION

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Electronic News Gathering (ENG) is the coverage of controlled events.
- T F 2. All television cameras operate on the same principle.
- T F 3. All color TV cameras need a minimum operating light level of 100 footcandles of illumination.
- T F 4. Lenses do not have a mechanism to control the amount of light admitted.
- T F 5. Zoom lenses can only be operated by manual controls.
- T F 6. The 3/4-inch format is currently the only (ENG) format used in the broadcast industry.
- T F 7. Most portable VCRs run on 9-volt batteries or AC power.

LIGHTING FOR ELECTRONIC NEWS GATHERING

46R Soldier's Manual Task: 214-177-1212

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of Lighting for Electronic News Gathering/Electronic Field Production (ENG/EFP) and the equipment necessary to perform these functions.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe common ENG lighting equipment and its purpose and functions

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from the following publication:

LIGHTING FOR ELECTRONIC NEWS GATHERING

INTRODUCTION

When you leave the comfortable confines of the television news room or production studio for a remote or location assignment, you will encounter more than a few unique problems. The problems can be overcome if you are prepared. Location remotes, are normally ENG news coverage. So let's direct our attention to this area.

One of the major problems is the availability of lights. If you are outdoors on a sunny day, there isn't much of a problem. However, when you move indoors or shoot at night, you'll need a portable, lightweight and versatile lighting system that either runs on batteries or plugs into a wall outlet without blowing fuses. This calls for a small, efficient, variable-beam light that's part of most ENG systems .

To understand lighting for ENG systems, we must first understand something about basic lighting for television. All the principles of television lighting apply to lighting for electronic news gathering with a few interesting wrinkles thrown in. In a studio the lighting is much more controlled than in the myriad of situations and circumstances you'll experience in the world of ENG. Most of the time the production will work with the existing lighting rather than the lighting being created or fit to the needs of the production. However, you'll need a complete understanding of basic television lighting to produce technically proficient and aesthetically pleasing news stories that will draw and hold your audience's attention.

TELEVISION LIGHTING

Lighting for television can be broken down into six basic objectives. They are:

- o Fulfill the technical requirements of the system. The lighting must provide enough illumination for the television camera to see and reproduce an image. Low light levels will produce inferior video.

- o Give the illusion of three dimensions on a two dimensional surface. (The television screen) The television screen has height and width. Since we cannot actually add depth, we must create the illusion of it. We can do this with camera angles, the considered placement of objects in the videospace and most commonly, with the careful use of lighting
- o Guide the viewer's eye to important points in the viewing space. It's a proven fact that our eye is drawn to a bright spot first. Using this, we can lead the viewer's eye and ensure that all the important points are covered.
- o Establish or convey a mood. The overall mood of a story or scene can tell the story as much as the scene itself. Lighting can convey the overall mood to the viewer.
- o Establish or fix the time. Lighting can fix the time of day as convincingly as a clock on the wall without being so obvious or blunt.
- o Contribute to the aesthetic quality of the scene. Perhaps a good analogy of what aesthetic quality does for something is the difference between music and noise.

Of course not all six objectives will apply equally to every scene or even apply at all to absolutely every frame of video, but knowing what they are and how they work will aid you in being more effective when telling the story.

WHAT IS LIGHT?

Light is electromagnetic radiation, transmitted from any number of natural or artificial sources. The human eye can only see a small fraction of the electromagnetic spectrum. That light we can see is called white light although it is made up of all the colors of the rainbow. If you understand the cause of a rainbow, or the effect of a prism, you know that spectral hues are different wavelengths of light. These wavelengths vibrate at different frequencies and appear to us as different colors.

PROPERTIES OF COLOR LIGHT

When we consider the television camera and its operation, we must remember the three basic attributes of color light are hue, saturation and brightness. Hue is the color of the light itself. Saturation is the intensity of the color or how much white light is mixed in with it. (Remember white

light contains all the other colors) You might say "how pure the color of the light is," and brightness is the overall brightness of the color, or how much light it will reflect. Although these three attributes of color light are entirely independent of each other and surrounding objects and difficult to measure accurately, our best understanding of them is in a relative sense. Since it wouldn't matter to us what the measurement of brightness of a particular color was on the television screen, how bright it appears next to the colors around it does matter.

One thing we must keep in mind when considering colors for television, is that not all viewers are watching in color. Therefore, we must know what effect a color will have on the gray scale. This is one of the reasons that all viewfinders on portable cameras are monochrome. Be aware that something in the picture that is changing colors may not be evident to those viewing in black and white unless the brightness is also changing.

COLOR TEMPERATURE

Color temperature is the amount of certain colors making up a particular white light. Color temperature is measured in degrees Kelvin. Since the video camera changes images into electronic signals, the wavelengths of light that vibrate at various frequencies, making up the different hues or colors, will have an effect on the output of the camera. As the color temperature of light changes, the human eye adjusts to it much better than the video camera. Even the human eye detects color temperature change though. EXAMPLE: Late afternoon light appears more orange than midday light. This is a result of the light passing through more atmosphere and being filtered by more particles in that atmosphere.

The clearest and simplest way to think of color temperature without getting into complicated formulas is to say that light of a lower color temperature appears more toward the orange end of the scale while light of a higher color temperature appears more toward the blue end of the scale. Studio lighting is standardized at 3,200 degrees Kelvin. Daylight sources are balanced in the range of 5,000 to 7,000 degrees K. We need not know what a degree Kelvin is specifically as long as we accept it as a unit of measure and know how color temperature effects the color television picture. Of course, it only effects color video, not monochrome.

HARD LIGHT, SOFT LIGHT

The difference between hard and soft light is another critical aspect in lighting for ENG. Hard and soft light

appear differently in the video picture and go a long way toward directing attention, establishing a mood and contributing to the aesthetic appeal of your video. Hard light is intense, directional and creates strong shadows. Artificial light sources that produce hard light usually have hard, shiny rather shallow reflectors. Soft light is a more spread out defused light that creates fewer, softer shadows. Soft light is produced by an instrument with a rough or matte surfaced reflector that is deeper or more curved allowing for more angles of reflection (see Figure 2-1). Soft light is used mostly to fill in and soften shadows and provide a more even light.

SCOOP

ELLIPSOIDAL SPOTLIGHT

FRESNELL

Figure 2-1. ARTIFICIAL LIGHTING INSTRUMENTS

CONTRAST RANGE

Contrast range is critically important since the television camera is not nearly as sensitive as the human eye. Television cameras can handle a range of only 3 to 60 percent reflectance; a 20:1 ratio. Simply stated that means that the brightest part of the video picture can only be 20 times brighter than the darkest part for the camera to be able to reproduce it accurately. Note the term accurately. The camera will still reproduce everything in the picture that is within that range, and will begin to lose accuracy in the reproduction of those elements of the picture that exceed that range. In Electronic News Gathering, we seldom have control of those elements in the videospace. We must

learn to adapt as best we can to what exists. News events will not allow us to control the contrast range, but we must know how it affects our video and adjust. **EXAMPLE:** If there is an important scene that we must videotape that has a bright spot that exceeds the 60 percent reflectance, we must know that the camera will darken down the rest of the picture in bringing the spot into range. We then decide if we want the other parts of the picture to be darkened or if we go to manual iris and live with a washed out effect in the bright area. **CAUTION:** If you have a tube camera, be careful not to allow bright areas to cause burn-in.

MEASURING LIGHT FOR TELEVISION

Measuring light accurately enough for the television camera requires an instrument. As previously mentioned, sufficient light is a technical requirement which must be met in order for the camera to operate properly. Insufficient light levels will cause a camera to produce pictures with video noise, lag and color distortion. Most light-measuring devices are calibrated in foot candles and as mentioned earlier, most color cameras require between 100 and 250 foot candles. As we stated earlier, whatever the unit of measure, you must have a device that speaks the same language as your camera's manual. **EXAMPLE:** If the manual calls for a minimum of 100 foot candles, you need a light meter that measures foot candles. Accurately measuring the light is something done more in EFP than in ENG. Since we have little or no control of the contrast range in ENG, we usually concern ourselves with whether there is sufficient light, and when it is obvious that the range is exceeded, how we correct it. There are five ways to control light intensity when using artificial light. First, the wattage of the lighting instruments. Secondly, lamp to subject proximity. As the subject gets closer to the light source, it will decrease the area over which the light is spread and make it more intense (see Figure 2-2).

FIGURE 2-2. EFFECTS OF DISTANCE ON BRIGHTNESS

Keep in mind that by doubling the distance between light source and subject, you quadruple the area over which the same amount of light is spread, thus cutting to one fourth the intensity of the light.

The third method of controlling light intensity is with the use of scrims or screens. Scrims are translucent gauze or fiberglass in a frame that can be mounted on the front of a light instrument. Scrims cut down the amount of light allowed through. Screens are just like the material you'll find on any screen door. They do not defuse the light like scrims and are mostly used on spotlights to lessen the intensity without changing the hard directional beam. Key lights, for example, are often used with screens.

Fourth, the spotting of the beam on a spotlight will concentrate the beam or widen it. This is comparable to the effect of moving the light closer or further away, except without actually moving the light instrument.

The fifth way to control the intensity of light, is to lessen the voltage going to the instrument much like a dimmer in a home or the house lights in a theater. There's a negative side to this in that it will also lower the color temperature of the light.

Knowing how to strengthen or weaken the intensity of light won't help us much if we don't understand its applications. The best starting point to light any situation is the basic three-point lighting scheme. The intent of this scheme, in addition to providing enough light for the camera to see, is to create the illusion of three dimensions on the two dimensional television screen. (Height and width, but no depth). Since the screen on which the viewer sees the subject is only two dimensions, any appearance of three dimensions must be an illusion. It is created with the use of light and shadows. Bear in mind that you'll need the shadows. Your intent should be to use the shadows to accomplish your aim, not to eliminate them. Of course, you'll want to use them subtly to keep your product as aesthetically pleasing as possible. Figure 2-3 illustrates the basic three-point lighting scheme.

FIGURE 2-3. BASIC THREE-POINT LIGHTING SCHEME

The three points in the scheme are the key light, the fill light and the back light.

The **key light** is the apparent main light source. As the main source, it provides sufficient light to operate the camera, and act as the reference point for all other lighting. It should be placed in front of the subject, to the side about 45 degrees, and elevated 30 to 35 degrees. You may want to make adjustment for any number of reasons, but that's a good starting point. Key lights are usually spotlights.

The **back light** is to separate the subject from the background by casting a rim of light across the head and shoulders of the subject. The back light should be placed

at an elevated angle, but not so much as to light the top of the subject's head. A good starting point for the back light is directly behind the subject, elevated 30 to 35 degrees. If your light is mounted on a stand, move it off to the side a little to get the stand out of the picture. Back lights are also most often a spotlight.

The **fill light** fills in and softens the harsh shadows created by the key light. It is placed on the opposite side of the camera from the key light and also elevated 30 to 35 degrees. Since fill lights usually need a broader beam, they are most often scoops.

News rarely happens in a studio, unless it is a formatted news show or studio interview, where the color temperature and lighting may be controlled. In the studio, production lights are quartz-iodine or quartz-halogen lights. They should all have the same color temperature standard of 3,200 degrees Kelvin. The standard has been set by the television engineers. If we wanted to recreate daylight in the studio, we would have to alter the color temperature to 5,600 degrees Kelvin by changing the lights or using gels.

ENG/EFP crews should always carry portable lights and use them frequently. You may not always need them, but you won't have time to go back to the station and pick up a set. There are occasions when video quality has to suffer to get the news story on videotape, but such times should be rare.

You should have at least three lights with tripods (stands), and clamps for mounting in all locations and situations. The more extension cords you have the better.

Another problem in lighting remote locations is color contamination from different light sources. Be aware of mixing lights of different color temperatures (Subcourse DI 0370, Television Lighting, Audio and Scenery, has more detailed information on TV lighting). **A rule to remember is, white balance whenever the light conditions change.**

PORTABLE LIGHTING KIT

Portable lighting kits will supply you with the lighting equipment you will need in most situations. They include: Lighting instruments, tripods, (short) power cables, battery packs for each light and accessories such as screens and filters. You may want to include a .set of insulated gloves and some heavy-duty masking tape or gaffer's tape and extra bulbs (at least one for each lighting instrument).

There are many commercially available selections of ENG/EFP lighting kits. They usually provide at least enough instruments and accessories for basic three-point lighting.

The color temperature of lighting kit instruments is 3200 degrees Kelvin and they are usually variable-focus lighting instruments which may be adjusted for use as a key, back or fill light (see Figure 2-4, Variable-Focus Instrument)

FIGURE 2-4. VARIABLE-FOCUS INSTRUMENT

ACCESSORIES

Your light kit should contain accessories such as barn doors, screens and reflectors. These accessories are discussed in Subcourse DI 0370.

Barn Doors

Barn doors are attached to a ring which is connected to the body of the lighting instrument. The doors may be opened from the top and bottom to crop the light.

Screens

Screens are small round or square pieces of metal screening that are placed in front of the light to reduce the light intensity. The screening does not change the color temperature of the light. Strong shadows may be reduced or eliminated by using screens.

Reflectors

Folding reflectors are sometimes available in lighting kits and sometimes have to be obtained separately. Reflectors bounce natural or artificial light toward the subject in order to fill in or remove strong shadows.

Setting up these accessories takes time, but results will be well worth the time spent. They make the subject look as natural as possible and help eliminate lighting conditions that distract the viewer.

The Five P's rule -- "Proper Planning Prevents Poor Productions" -- is a good guideline when planning any news or production assignment. Only experience will help you to become familiar with many of the requirements before you leave the station. In remote situations, the Five-P' s will save you a lot of headaches.

An extensive review of Lighting for Television may be found in Subcourse DI 0370.

LESSON THREE

FRAMING AND COMPOSITION

46R Soldier's Manual Task: 214-177-1315

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of television framing and composition.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe common terms for varying shots and what is acceptable as proper composition of them.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from the following publication:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's
Guide, Broadcast Journalist, MOS 46R Skill
Levels 1/2/3/4/, August 1988

FRAMING AND COMPOSITION

INTRODUCTION

Framing and composition are important in television production because the audience or viewer must receive all the video information through an instrument that has no peripheral vision. Since we see only what the director and camera operators show us, it is of utmost importance that the camera operator develop a feel for pictorial composition which is learned through intuition, practice and experience. Over the years there have been many guidelines developed through the work of painters, photographers, cinematographers and videographers. Although there is no substitute for intuition, practice and experience, you will be able to begin by applying a few basic principles.

NEEDS AND WANTS

There are many items you need to take into consideration when deciding how to show a subject. However, two basic points should be kept in mind that will make sure you have video picture impact. They are:

- o show viewers what they need to see
- o show viewers what they want to see

Viewers need to see the event as it is occurring or you would not be taking the time to shoot. So, the event you are shooting has caught your attention. Now that your interest has been aroused, the other is the viewer's want to see and explore the side action that makes the event interesting and exciting.

The best way to describe and fill the needs and wants of the viewer is to observe the event as it is taking place, as an impartial viewer. It's almost as if you are watching this happen in your living room, instead of from behind the camera. You should be involved in the event but not in the actual action.

Video Pictures

Your point of view (the way you describe what is taking place) is done with video-pictures. This point of view is accomplished by two different, but related, functions:

- o framing
- o composition

These two terms are often interchangeable, but for right now let's look at them separately.

Framing. Framing refers to how the various elements in and out of the video picture relate to each other, and how they are shown to the viewer. Simply put, these are all the important elements within the main picture area.

Composition. Composition refers to the organization of the important elements within the picture(s) and their artistic/aesthetic relationship to each other in the frame. The complete picture to the viewer is then unified or understandable.

These two concepts are closely related, but once you understand how to frame the shot, and compose those elements within the picture in an aesthetic manner, the two concepts merge.

Visual Statement

The main point to remember when setting up any shot for framing and composition is its **visual statement**. The visual statement is your point of view -- the concept you are trying to convey to the viewer. A picture that does not show the viewer the main action is not an effective shot or visual statement.

We have all seen television shows that have left us confused or frustrated because the shots the director had selected or the camera operator framed and composed did not present the visual information we needed or wanted in order to enjoy the program. For example, when the action happens so fast that the camera operator can't respond quickly enough to the events taking place, such as an accident happening on a race track. It's also possible for the director to be fooled when a score is made by a different player than expected.

Each situation is different. You will have to let your experience and feeling for the program material guide the way you frame and compose the shot (s). Experience will teach you the best way to frame and compose.

Framing Loss

The picture that is seen by the viewers is not exactly the same picture that is seen by the camera operator. The camera picture, through transmission to the viewer's set, loses about 10 to 15 percent on the outer edges or borders are cropped or lost. This is why the center of the picture is so important when framing and composing the shot (Figure 3-1). Some operators use a grease pencil to mark the outer

edge of their viewfinders to let them know where the main area of the picture is and to keep all essential elements within this area so the information is not lost. In a studio environment, the director has the ultimate responsibility for framing and composing the final picture or statement. But in a field situation, the camera operator has this responsibility. So it's a lot easier if everyone sets up his shot(s) with the main area in the center of the viewfinder.

FIGURE 3-1. FRAMING LOSS

FIELD OF VIEW

The field of view is of critical importance to the camera operator. The field of view shows the relationship between the main object of the picture and its surroundings.

A good camera operator must be able to properly compose and frame shots. Picture composition is nothing more than the organization of the visual elements (statement) within the available videospace. When framing a shot, the camera operator needs to keep in mind the essential area of the picture. Remember what is seen in the camera viewfinder is not what is seen on the home TV screen. The picture that leaves the TV camera is processed through the TV system and is electronically cropped or reduced.

Since 10 to 15 percent of the picture around the outer border area is lost during transmission, what you see is not necessarily what the viewer gets. You should always frame shots to allow for that 10 to 15 percent border loss.

Another aspect to keep in mind is that most cameras viewfinders are not exact. So even if the shot looks OK in your viewfinder you may have to fine-tune the shot. Experience with the camera system will teach you the quirks of each system.

There are several different camera shots the operator must be able to set up quickly and accurately:

- o extreme long shot
- o long shot
- o medium shot
- o close up
- o extreme close up

These basic shots are the foundation of all other camera shots. They're used to create certain emotional effects in the viewer. Learning and understanding how to achieve these basic shots quickly and proficiently is the mark of a professional cameraman.

Extreme Long Shot

The extreme long shot, also known as the establishing shot, is achieved when the camera lens is zoomed all the way out. This shot is used to let the viewer know where he is; it sets the scene; the background dominates (Fig. 3-2).

FIGURE 3-2. EXTREME LONG SHOT

Long Shot

The long shot is slightly closer than the extreme long shot but the background still dominates (Fig. 3-3). Everything is in focus.

FIGURE 3-3. LONG SHOT

Medium Shot

In the medium shot, the subject dominates the picture. The medium shot is used primarily to show the subject in relation to the action in a scene (Fig. 3-4). The middle ground and foreground are normally in focus.

FIGURE 3-4. MEDIUM SHOT

Close-up

The close-up shot focuses primarily on the subject with only a small portion of the background-shown (Fig. 3-5).

FIGURE 3-5. CLOSE-UP

Extreme Close-up

The extreme close-up shows the subject totally dominating the shot. The close-up is used to show details of extreme importance in the picture (Fig. 3-6).

FIGURE 3-6. EXTREME CLOSE-UP

Now let's look at the shots again using, just one person. The extreme long shot establishes the scene. The long shot would be from the subject's feet to his head. Remember to allow space at the top for framing loss. The medium shot or knee shot would be from the head to the knees. The medium close-up is from the waist to the top of the head, or it could be a bust shot from the bottom of the bust to the top of the head. The close-up or head shot is from about the chin to the top of the head. And the extreme close-up is usually just a specific part of a person's face.

Generally, if the subject is facing directly into the camera and is the only subject in the field of view, the subject should be centered.

Lead Room

If the subject is at an angle to the camera, the camera operator needs to provide lead room or speaking room. A good rule of thumb is to center the nose, then pan right or left respectively and allow for head room.

If your subject or object is going to move on camera, e.g., walk across or drive through the scene, you need to leave more space in front of the object than behind (Fig. 3-7 Lead Room).

FIGURE 3-7. LEAD ROOM

Multiple Subjects

The term four-shot means the shot contains four subjects or objects. Likewise, the three-shot designates three subjects or objects. The two-shot identifies two subjects or objects. And the one-shot contains only one subject or object in the picture.

CAMERA ANGLES

Camera angles include the normal angle which show the scene as we see it in real life, at about eye level.

Shooting over-the-shoulder adds depth to the picture and establishes a relationship between individuals.

The high camera angle that shoots down on the subject makes the subject appear smaller than he really is.

The low camera angle looking up at the subject makes the subject look taller and overpowering (Fig. 3-8).

Normal angle

Over-the-shoulder

Journalism Style Guide

VIDEO SCRIPTWRITING

INTRODUCTION

The ability to write comes from much learning and practice. It's difficult, if not impossible, to teach someone to write, much less write well, in one short lesson. This lesson will give you basic rules of broadcast writing and how it differs from writing for the print media. The single most important direction in learning to write is to...write, write, write. Reading also helps a lot. Observe the writings of others.

PROCEDURES AND LIMITATIONS

When writing for broadcast, you should apply six "C's". They are; **CLEAR ... CONCISE ...CONVERSATIONAL ...COMPLETE ...CURRENT** ...and, most importantly, **CORRECT**. Let's address each of these points, one at a time.

Clear

Broadcast copy must be clear. In printed copy, the reader can reread anything that isn't completely clear to him. In the broadcast medium, the viewer hasn't that luxury. If something isn't clear, he won't understand it, and he can't go back over it since it's being read to him by someone else who isn't going to repeat it. Once gone, it's gone forever.

Concise

The need for this comes from the value of time in the broadcast industry. Since air-time is so valuable, we can't afford to use any more of it than necessary.

Conversational

The copy is going to be read to its intended audience. It should be done in a conversational manner, something that's possible only if the copy is written conversationally.

Complete

There are occasions when something will be presented in multiple parts or segments. It must still be complete to the extent that it can stand alone. If something is going to be multiparted, each segment must still be complete as a part. That is to say that there must be something to tell

the audience that there is going to be more to come and it'll probably contain information such as where and when it will be presented. So even though the entire story isn't being presented in one piece, each piece is still complete as a part.

Current

Although there are some exceptions, copy should generally be written in the present tense. When something is presented as being of or about another time, it is presented as in the present. For example, even if we receive something that is of a historical nature, we write about it in the here and now. We never lose sight of the fact that that's where we are, so the copy shouldn't either.

Correct

The importance of being correct cannot be stressed enough. Broadcast media credibility is on the line with every story aired. "I saw it on television" seems to be enough proof for many people. This has both good and bad points. It requires us to work diligently to make sure of accuracy, but it adds a certain value to those things we say in our video scripting.

The structure of a broadcast news story is usually the reverse of that for the print media. The first thing in the broadcast story is the "WHAT." This attracts the listeners' attention and alerts them to what is about to follow...the details. Since a viewer cannot absorb all the facts in the first line, they must be given them in a form that will enhance understanding. Instead of "What happened to who, when and where with a why thrown in" and then explaining it in the rest of the story, broadcast style is more like "What happened", "It happened where and when", "This is why it happened", and we'll put in the how if we have it.

The Lead

The lead is the most important sentence in a broadcast story and should be an attention-getting sentence. It should have enough information to pique the listener's interest, without overwhelming him. It should be written as a general "what happened." There is an art to writing good leads, one of the reasons broadcast writing is difficult to teach. A lead sentence should be 20-words or fewer and contain as much information as possible without overloading the listener. To begin the sentence, use one or two words that are NOT essential information in the story. It's not good to begin with numbers that are essential for the same reason. Much

of the time, the viewers' mind isn't geared up for the story and it takes a word or two for them to be fully alerted to receive the essential information. Usually, a lead can be made much better by changing it around a little. EXAMPLE: "130-thousand soldiers could be cut from the Army in the near future, it was announced today." The listener would better understand this if it were worded, "The Army announced today it is anticipating manpower cuts of 130-thousand in the near future."

The Body

After the lead, the story must have a logical development. This is the body. It's quite simply telling the rest of the story in an orderly fashion, flowing smoothly to an end. Of course, the most important fact will come next and the next most important fact next, and so on. With practice you will learn to discern the important from the trivial. This is of utmost importance in broadcast writing because "air time" is limited and valuable. Typically, the same story will be divulged in both the print and broadcast media. It isn't at all uncommon for the broadcast version to be only one tenth as long as the print version.

Tense

The natural tense for broadcast copy is the PRESENT TENSE. This is because most news reporting is of immediate, or at least, very recent news. However, every story doesn't have to sound as if it happened in the last minute. As a matter of fact, many events which occurred in the past must be reported in the past tense. A good example of this is in the reporting of sports scores. It's acceptable to headline something in the present tense to entice the audience to come back after a break, such as "Ohio State upsets Notre Dame ... that, and the rest of the sports scores right after this." But the fact that they are final scores, makes them past tense and they should be so reported.

Voice

Broadcast copy should be in the active voice. It's quicker, it's more conversational and it carries more impact.

EXAMPLE:

Passive: THE EVIDENCE WAS GATHERED BY THE POLICE
DEPARTMENT.

Active: THE POLICE DEPARTMENT GATHERED THE EVIDENCE.

Write For The Ear

In keeping your copy conversational you'll be writing for the ear. Your video will enhance the audio, but the audio must be able to stand alone. It is for this reason that we refer to broadcast writing rather than just television writing. Remember, blind people listen to television and, much of the time, sighted people listen to television while they're doing other things. Use everyday language. Use contractions. Write as people speak.

EXAMPLE:

Bad: IT WAS INDICATED BY THE POLICE CHIEF THAT AN
ARREST WAS IMMINENT.

Good: THE POLICE CHIEF SAID AN ARREST WAS IMMINENT.

Sentence Length

Keep sentences short. They're easier for the newscaster to read and for the audience to understand. Remember, the lead should be 20 words or fewer and the rest of the sentences should be 25 words or fewer. Even though they can be 25 words long, sentences other than the lead should average 17 words. They should vary in length to avoid a pattern effect. For spot announcements, the maximum sentence length should be 17 words. Shorter sentences give a feeling of action and urgency, but it's also easy to sound choppy if you're not careful to vary the sentence length within the word limit.

EXAMPLE:

Since they were not forwarded for a final vote, they can be resurrected only by a two-thirds vote of the house or by being added to bills under consideration later in house-senate conference committees, in which conferees try to reach agreements on bills that have passed the house and senate but in different forms.

This example is a sentence that was taken directly from a daily newspaper in a major American city. It illustrates the need to shorten sentences for broadcast copy. If you can go over it again, you can understand it, but try to read it aloud and make yourself understood. By dividing this 56-word sentence into four sentences of 1, 10, 15 and 19 words, we make it much clearer.

THE BILLS WEREN'T FORWARDED FOR A FINAL VOTE, BUT THEY CAN STILL BE RESURRECTED. ONE METHOD IS A TWO-THIRDS VOTE BY THE HOUSE. ANOTHER IS BY ADDING THEM TO BILLS UNDER CONSIDERATION LATER IN HOUSE-SENATE CONFERENCE COMMITTEES. THESE COMMITTEES TRY TO REACH AGREEMENT ON BILLS THAT HAVE PASSED THE HOUSE AND SENATE, BUT IN DIFFERENT FORMS.

Quotations and Attribution

It takes a little subtlety on the part of the broadcast writer when it comes to quotations and attribution. In the printed format, it's nothing more than putting something in quotation marks. However, the listening audience can't see quotation marks. This can be overcome with the use of phrases like, "he said" with a slight pause or a faint change of tone before the actual quote. This will leave no doubt in the mind of the listener that he is hearing the exact words of the original speaker.

EXAMPLE:

THE CHIEF PETTY OFFICER SAID,"I THINK SHE'S THE
FINEST SHIP AFLOAT"

When it is absolutely necessary to remove all chance of doubt from the listener's mind, you can use "QUOTE" and "END QUOTE." However, this is disconcerting and certainly unconversational, and you should avoid it whenever possible. If you're quoting someone and it's necessary to use a long quote, don't worry about rules for sentence length. Avoid long quotes whenever possible for obvious reasons. When you have to link the speaker with the quote, use conversational phrases.

EXAMPLE:

THE CHIEF ADDED....

or

HE CONTINUED BY SAYING...

It's usually a good idea to identify your source as quickly as possible. We don't want the listener/viewer to miss any of the important information because he's trying to figure out who is being quoted.

Credits

When quoting source material, since we can't use footnotes, we need to give oral attribution to both the source and its author, and it should be done in the first reference. Then in subsequent references we can attribute either the source or the author.

EXAMPLE:

IN THE "NINTH NEW COLLEGIATE DICTIONARY," MERRIAM
WEBSTER PUTS THE ACCENT ON THE FIRST SYLLABLE IN THE
NOUN, "ATTRIBUTE." WHEN IT'S A TRANSITIVE VERB,
HOWEVER, THE ACCENT IS PUT ON THE SECOND SYLLABLE.

Whenever a production is going to require a lot of attribution it can be done in the form of credits at the end. It can also be done with a crawl by the character generator as well as by an announcer. It wouldn't hurt to include the credit in the copy since the video can be missed by anyone in the audience who is just listening. Of course, known facts need not always be credited.

EXAMPLE:

IT'S TIME FOR ALL OF US TO REMIND OURSELVES TO,
"ASK NOT WHAT YOUR COUNTRY CAN DO FOR YOU, ASK WHAT
YOU CAN DO FOR YOUR COUNTRY."

As a broadcast writer, you must exercise careful judgment in determining whether such material is sufficiently original or identifiable with its author or source as to not require credit.

Numbers

From one to nine. Write out: ONE, TWO, THREE, etc., unless they are being used for sports scores, time, dates or telephone numbers.

From 10 to 999. Use numerals: 10, 20, 30, 128, 925, etc.

More than 999. Both of the preceding styles apply with one slight addition. Substitute for the zeroes, words that mean what those zeroes represent, such as: ONE-HUNDRED, 15-HUNDRED, THREE-THOUSAND or 71-BILLION, etc.

Dates. JANUARY 1ST, JUNE 29TH, JULY 4TH, etc.

Years. Four digit numerals such as 1980 or 1995.

Money. 10-THOUSAND DOLLARS, TWO-MILLION YEN, 29-D-MARK.

Fractions. TWO-THIRDS, ONE-FOURTH, 16-THIRTY SECONDS.

Percentages. FIVE PER CENT, 22 PER CENT.

Telephone numbers. 542-4014 or EXTENSION 4-0-1-4 (for emphasis)

Addresses. ONE WEST EAGER STREET, 65505 NORTH 69TH AVENUE.

Building numbers. BUILDING ONE; BUILDING 400; etc.

Ages. TEPEE-WEEK-OLD BABY, 21-YEAR-OLD PRIVATE.

Time. 9:00 THIS MORNING or NINE A-M.

Decimals. 15-POINT-FIVE or FIVE-POINT-TWO.

Roman numerals. LOUIS THE 16TH, POPE JOHN PAUL THE SECOND.

Ratings. NUMBER SIX ON THE CHART, RANKED 26TH BY THE AP WRITERS.

Scores. 7 TO 3, 19 TO 12, 35 TO NOTHING.

License. B-R 549

Military units. SECOND BATTALION, 82ND AIRBORNE, SEVENTH ARMY. (Written as spoken)

Equipment designations. M-16 RIFLE, C-FIVE-A "GALAXY", C-ONE-30 "HERCULES"

Punctuation

The period. As in any writing, the period indicates the end of a sentence or thought. More periods are used in broadcast writing because broadcast news sentences are shorter and more conversational.

The comma. A comma indicates a pause shorter than that of a period. Geographical names and most items in dates and addresses are also set off by commas.

EXAMPLE:

WE MOVED FROM FORT BRAGG, NORTH CAROLINA, ON JUNE 29TH,
1985.

The dash. Use the dash to set off appositives and other parenthetical expressions.

EXAMPLE:

NATO -- THE NORTH ATLANTIC TREATY ORGANIZATION -- IS
PRIMARILY RESPONSIBLE FOR...

The hyphen. Use the hyphen to help announcers in phrasing difficult words and to instruct them to pronounce individual elements distinctly.

EXAMPLE:

RE-ADJUST, RE-EVALUATE, W-A-B-C, F-B-I, U-S, A-M

DO NOT hyphenate or divide a word at the end of a line. Spell out the entire word OR move it to the next line.

The ellipsis. Occasionally, you can use a series of three dots to indicate a pause longer than that of a comma. The series of three dots can be used for dramatic effect:

EXAMPLE:

THE JURY FOREMAN ANNOUNCED IN A CLEAR FIRM VOICE...
"INNOCENT!"

The quotation marks. In addition to its normal use for indicating quotes, the quotation marks can also be used to set off nicknames, titles of books and plays, etc.

EXAMPLE:

THE ONE--HUNDRED FIRST AIRBORNE DIVISION -- BETTER KNOWN
AS THE "SCREAMING EAGLES" -- MAKES ITS HOME AT FORT...

Parentheses. In broadcast copy, material in parentheses is information for the announcer and normally not meant to be read aloud. It includes notes to the announcer such as pronunciation guides, a date, reading rates, etc.

EXAMPLE:

COLONEL PAIKEN (PAY-KEN) ARRIVES ON SUNDAY (MAY 21ST).

Speaking Of Words

Remember, anyone can turn on a radio or television set. Choose words that everyone will understand, the announcer as well as the listener. Don't expect things of your audience. Make your copy clear and understandable.

Contractions. In day-to-day conversations, contractions are used liberally. "It's" instead of "it is", and "they're" instead of "they are" will make copy more conversational. A couple of exceptions to this are the "it will" contraction ("it'll") and "they will" ("they'll") which are awkward to the ear.

Pronouns. There is a danger in using personal pronouns in broadcast copy. You must be sure your audience knows who you're talking about whenever you use "he", "she" or "they." The ear can't go back and pick-up the identification.

Alliterations. When you compose a sentence consisting of several words beginning with the same vowels or consonants, you have alliterations and the announcer has a problem.

EXAMPLE:

THE WESTERLY WINDS WILL WHIP WRATH WITHIN WINDSOR...

or

THE DEVASTATED DAM DUMPED DRUDGE AND DIRT ON DES MOINES

Sibilants. Too many "s" or "sh" sounds tend to create a hissing sound when read aloud.

EXAMPLE:

THE SIXTH SICK SHIEK'S SIXTH SHEEP'S SICK

And of course, you should always be aware of how difficult your copy will be to read aloud. Try it yourself if you have any doubt. This can be a second reason for reading your copy aloud in addition to double-checking it for time. We'll discuss how to time your copy later.

Homonyms. Watch out for homonyms, words which sound alike but have different meanings. The listener can't hear the difference between "won" and "one", "bear" and "bare."

Here and there. Since your listeners could be anywhere, "here" and "there" can mean something different to each of them and change the meaning of your copy. These words can be avoided simply by calling "here" or "there" by its name. If "here" is Fort Knox, say "FORT KNOX."

Libelous words. Used improperly in your story, many words could lead to libel. Be very careful with words like: atheist, Fascist, seducer, bigamist, illegitimate, deadbeat, addict, etc. Keep in mind also that until someone is convicted of a crime or some wrong doing, he is only a "suspect" or the "accused" and his guilt is "alleged."

Not, "not". Avoid the use of the word "not" in your copy. "Not" can easily be dropped inadvertently and leave the listener wondering if he heard "not" or not.

EXAMPLES

<u>Use</u>	<u>Avoid</u>
DISHONEST	NOT HONEST
INNOCENT	NOT GUILTY
FORGOT	DID NOT REMEMBER
UNABLE	NOT ABLE

Other meaningless words. Avoid meaningless words like "latter," "former" and "respectively," when referring to persons, places or things already mentioned. Again, listeners can't refer back. Likewise, avoid transitional phrases within your stories such as "meanwhile," "meantime" and "incidentally." They're crutches. While each thought, phrase or paragraph should flow to the next, it should be done with skillful organization, not throw-away transitional words.

Steer clear of flowery phrases and trite expressions that take up time and space and add nothing. Avoid slang, vulgarisms and dialect in news writing.

Always translate military jargon, technical, legal and foreign terms into simple language.

EXAMPLES

<u>Use</u>	<u>Avoid</u>
ASSIGNED	DETAILED

BEFORE	PRIOR TO
ENLISTMENT	HITCH
IF	IN THE EVENT OF
SAID	CLAIMED

Good Taste

What can we say about good taste? It's relative. It's very easy to be misunderstood, and even when your meaning is quite clear, there's a chance that someone will feel it's in bad taste. You MUST therefore, take all precautions to be sure your words, phrases and manner of presenting information will not embarrass your command, your service, or the United States Government.

Handling Titles And Names

Don't lead off a broadcast story with a person's name if you can avoid it. In the case of names and titles being used together, precede the name with the title. It should be, "SPECIAL AGENT ELLIOTT NESS", not "ELLIOTT NESS, SPECIAL AGENT." This alerts your listener that a name is coming up and gives him a better chance to comprehend your story.

Official titles. Refer to federal office holders by title or as "mister" or "ms." That is SENATOR JONES or MISTER JONES .. CONGRESSMAN SMITH or MISTER SMITH... CONGRESSWOMAN BROWN or MS BROWN...

Difficult names. Whenever a difficult name isn't essential, use the person's title, such as "THE FOREIGN MINISTER OF SWEDEN... "

Initials. It's best to omit initials in a person's name unless it is a well-known part of the person's name such as HOWARD K. SMITH or MICHAEL J. FOX or F. LEE BAILEY. The other exception is when the nature of the story requires further clarification such as births or deaths.

Phonetic spelling. If there's any way for an announcer to mispronounce a difficult or unusual name, assume he'll do it. So give him all the help you can. Write the phonetic spelling in parentheses and place it immediately after the troublesome word. Be sure to underline the phonetic syllable that is to be accented or stressed.

EXAMPLE:

SERGEANT KOLLMAN (COAL-MAN) ENTERED...

MUNICH (MEW-NICK), GERMANY IS THE CAPITOL OF....

Make sure the phonetic spelling appears on the same line as the word it represents.

Abbreviations

A good rule to remember on the use of abbreviations in broadcast copy is...WHEN IN DOUBT, WRITE IT OUT. (Hours and hours of extra time spent in writing things out isn't worth trading for one moment's embarrassment on the air.) Consider as well, the additional chance of misunderstanding on the part of the listener.

Never abbreviate names of states, cities, countries, political parties (except G-O-P), days of the week, months, titles of officials and address identification such as street, avenue, drive or boulevard.

Never start a sentence with either an abbreviated word or number. WHEN IN DOUBT, WRITE IT OUT.

Acronyms

When using an unfamiliar abbreviation or acronym which will be pronounced as a word, be sure to spell it out in the first usage.

EXAMPLE:

"THE DEFENSE INFORMATION SCHOOL, COMMONLY CALLED DINFOS.."

"CHAMPUS - THE CIVILIAN HEALTH AND MEDICAL PROGRAM FOR THE
UNIFORMED SERVICES - HELPS SERVICEMEN AND THEIR FAMILIES."

All-CAPS or Upper/Lowercase?

Do you type broadcast copy in all-caps or uppercase and lowercase letters? Some newsrooms favor an all-caps format for consistency with copy coming over teletypes. Studies, however, show that copy typed in uppercase and lowercase letters is easier to read. One thing to consider when using uppercase and lowercase is the chance of failure to capitalize, which could confuse an announcer and cause him to stumble.

Timing your copy

The total line count of a broadcast news release is the most common measure of the length or time.

In television scripts, the storyline or audio shares the page with the video. Therefore, with only half the page for the story content, the typewriter margins are set for an average of 35 characters or spaces per line. As a result, 14 to 16 lines of television copy will average 30 seconds, or two seconds per line.

Though not the preferred method, the length or time of a broadcast news release can also be measured by total word count. Announcers read at varying speeds, but the average is two-and-a-half words per second. This would mean approximately 150 words for a 60-second story.

Numbering pages

Whenever your broadcast copy is more than one page, pages are numbered consecutively: 1 of _, 2 of _, 3 of _. If your script is 10 pages long, the first page would be numbered 1 of 10, and the last page would be numbered 10 of 10. Page numbers are typed in the upper right hand corner of the page. Page numbers are extremely important in broadcast copy. Imagine an announcer on his way to an air shift, exactly on time, who drops his copy and gets the pages mixed up. There won't be enough time to sort them out if they don't have page numbers.

The Four-Unit Reading

This consists of a slugline, date, length of copy and type of release. The slugline serves as a little headline of the story. The date is the date the release was prepared. The copy length tells in seconds, approximately how long it will take to read the story. There are two types of releases. The immediate release for hard news items and the like, and the general release for soft news, features, spots or any other material that doesn't have the immediacy of hard news.

EXAMPLE:

OUTDOOR RECREATION

APRIL 1, 19XX

(30 SECONDS)

FOR GENERAL RELEASE

In place of the type of release, you can have a DO NOT USE AFTER line with time and date. This is for timely material, usually about an event that will run for a limited time. It gives the broadcaster a cut-off date or time to discontinue

airing the release. You can also have a HOLD FOR RELEASE UNTIL line for advance releases. This is a good tool for providing material in advance, even though it shouldn't be aired until a certain time. It allows others the luxury of planning and scheduling without putting the material out too soon.

Video-change Spacing

In television copy, the rule is double spacing. When a video change is to occur in a television script, we then triple space. This alerts the announcer that there is a video change taking place. It may be returning from another video source to the announcer on camera. The announcer shouldn't be seen looking off camera, and if for some reason he needs to look elsewhere, such as to a monitor for an on-cue point, the script will alert him as to when he won't be on camera.

On-cue

When reading to a videotape in a television script, announcers need a way to prevent coming out ahead of the tape, or being too slow and thus behind the tape. One method used is "ON-CUE." At selected points in the script, the writer builds in places for the announcer to pause, look at the studio monitor and wait for a particular point at which to continue. The number of times this is done in a script depends on the length of the script. The longer the script, the more times the announcer should pause. This is one way to compensate for the varying speeds at which different announcers read.

The End or # # #

The number symbols (# # #) indicate the end of your broadcast release. Sometimes called "Dunphys," they should be centered under your manuscript column. You should have the word "more" in that same position when additional copy follows on another page.

Editing Broadcast Copy

Absolutely clean copy -- free of mistakes -- is the rule for copy designed for outside release to television stations. Sloppy copy is a distraction to the broadcaster, and it makes a negative statement about you, your leadership and your unit. For in-house productions, edit marks may be used sparingly, but only those edit marks that are easily understood. DO NOT USE PRINT MEDIA COPY EDIT MARKS.

Feature Writing

A feature provides a change of pace to a newscast. Features usually focus on soft news items and provide a lighter note.

Use colorful treatment when writing a feature story. Colorful treatment uses active, vivid, descriptive words with precise meanings. Verbs are in the active voice and paint word pictures.

Features need logical development to be convincing. The lead sentence should grab the listener's attention. A sequential arrangement of facts brings the story to a logical conclusion.

At the end, a telling point illustrates the central idea or the informational objective of the story. Often, the telling point refers to the lead by restating the same idea.

Good features don't just happen...they're created through skillful writing.

Spot Announcements

Americans grow up with commercial messages and spot announcements. In contrast to features, which may be used only once, commercials or spots are usually aired over and over again.

Department of Defense public affairs members do not write commercials. We write spots or spot announcements. Understandably there is a similarity, since commercial messages are often called spots.

We think of the civilian media spot or commercial as something that sells a product. The spot announcement, as it applies to DOD public affairs, can do even more. It can "sell" the viewer on an organization, activity or attitude.

There are two forms of spot writing: SELLING and INFORMATIONAL.

The SELLING spot informs the viewer, then tells him to do something. The selling spot has three steps: ATTENTION, APPEAL, and ACTION.

The INFORMATIONAL or information spot simply informs. The information spot uses only the ATTENTION and APPEAL steps. It does not specifically tell the audience what to do (action, etc.). It simply informs.

None of the sentences in a selling spot should be more than 17-words and the action step should not exceed six words.

VIDEO SCRIPTWRITING

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The lead sentence in a video script may be 25 words in length, but the rest of the sentences must be limited to only 20 words.
- T F 2. Three number signs, or Dunphys, must appear at the bottom of each page of your script.
- T F 3. Every page of a video script must be numbered sequentially.
- T F 4. When giving attribution you must use "QUOTE" and "END QUOTE."
- T F 5. It isn't necessary to give attribution to a quote that most people will recognize and associate with its author.
- T F 6. You can time your copy by counting lines when you don't have time to read it aloud and time it.
- T F 7. It's important to get as many facts in the first sentence as possible because air time is valuable and we need to tell the story quickly.

LESSON FIVE

ELECTRONIC EDITING

46R Soldier's Manual Task: 214-177-1318

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of electronic videotape editing.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe videotape format and techniques for the electronic editing procedure.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCE: The material contained in this lesson was derived from the following publication:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's
Guide, Broadcast Journalist, MOS 46R Skill
Levels 1/2/3/4/, August 1988

ELECTRONIC EDITING

INTRODUCTION

In the early days of videotape recording, the only way to edit videotape was to physically cut the tape and splice it back together much the same way film is edited. This is extremely difficult because unlike film, which is a physical or chemical process from start to finish, videotape is all electronic. You can't actually see where a picture starts or stops on the tape. The complicated process of cutting and splicing videotape is all but a forgotten art. Today, editing is done electronically.

With the 3/4-inch videocassette system, there is a playback machine, record machine, TV monitors and edit controls. The edit controls allow you to find an accurate beginning and ending -- "in and out" -- points for your edits. The TV monitors allow you to view the video being played back and the video being recorded (see Figure 4-1). The editing controls shuttle the tape back and forth, allowing you to perform the actual edits.

FIGURE 4-1. VIDEOTAPE EDITING SYSTEM

Tons

Before we start learning the editing process we need to become familiar with some of the broadcast terms used in editing.

Video track. The video information takes up most of the space on a videotape. The helical scan process used on 3/4-inch videocassette machines records the information on one or two video heads in a series of diagonal lines onto the videotape.

Audio track. Depending on the system used, you may have anywhere from one to three audio tracks on the videotape. The camcorder's video cassette and 3/4-inch video cassette recorders have only two tracks of audio. The audio tracks are placed in different locations on the videotape, but work just like the audio recording process.

Control track. The control track on videotape is similar to the sprocket holes in film. Without the control track, you can't edit. There are two ways to record the tracks. Laying control track on a blank tape is the first step in the videotape editing process in the insert edit mode. When in the assemble edit mode, the control track is added as you assemble the video package.

The control track consists of evenly spaced electronic blips or spikes called **sync-pulses**.

Cue (address) track. One of the audio tracks (or in some cases a separate track) is used to record cueing information for editing. This information may consist of audio or visual time and/or frame identification (see Figure 4-2).

FIGURE 4-2. TRACK LOCATION, 3/4" VIDEOTAPE

Electronic Editing

Electronic editing is a transfer or dubbing process that allows the operator to play back a videotape cassette and to place recorded material from the cassette in the desired order on another tape (see Figure 4-1).

The recorded material, both sound and pictures, is transferred onto an edit/record VCR, which assembles or inserts the raw information or footage into a completed sequence or program. The edit/record controls allow us to precisely place when and where the information on the recorded tape will occur. The operator decides where the raw footage will start or end, placing that footage on the recording tape.

EDITING MODES

There are two kinds of edits that you may make on an editing system. They are:

- o assemble edits
- o insert edits

Assemble Edits

In the assemble mode, the electronic editor adds control track and program footage (both audio tracks and the video track), to the existing editing VCR at a predetermined in edit point. The editing VCR continues recording the new information and the control track (electronic sprocket holes) until it is stopped. When you are assemble editing, you are inserting new control track at each in edit point and ending control track at each out edit point. Your video may be unstable (picture tearing or breakup) at the edit points during playback. Allow for extra video after your intended stop/out edit point -- otherwise you will not be able to edit onto the last part of the video (see Figure 4-3). Your out edit point will be too short.

Assemble edits are very convenient because you just add segments, building the video story or program.

FIGURE 4-3. ASSEMBLE EDITING

Insert Edits

Insert editing allows you to add or change video and/or audio separately or together without affecting the control track. As you insert the new material over the existing information, you use the already established control track to lock the signal into synchronization. The main drawback is that you must lay a long enough control track (TV black or crystal black) on the tape before you start editing. A one-hour program tape requires you to lay one hour of black before you start the editing process. Otherwise you will not have sufficient control track for the VCR machines to read on the recorded videotape (see Figure 4-4).

FIGURE 4-4. INSERT EDITING

*** * OPERATOR WARNING * * * ***

After laying the control track in the assemble mode, be sure to change the edit control unit to insert mode. Once you begin to make your first video or audio edit, if you haven't changed out of the assemble mode, the end of the edit will be dirty and there is no way to correct it without relaying the control track for the entire length of the tape.

The best approach is to stay in either the **assemble** or the **insert** mode. If and when you have to insert a piece of audio or video information over an assembled finished product, be careful of which buttons you are pushing.

Continuity

In editing, continuity refers to the viewer's ability to combine the different shots and scenes to make smooth transitions in time and space. In other words, the story is clear and concise without any distracting scenes that interfere with the content of your message.

For example, poor **screen direction** occurs when a subject moves in several directions. You, the cameraman, shot the scene from both sides, left to right and right to left. During the editing process, you edit the scenes together. This makes the subject look like he has made a quick turn around and headed in the opposite direction. A break in continuity will confuse the viewers and make them have to try to figure out what happened. Keep all video on one side of a 180 degree line or the other, and you'll avoid this.

Avoid such abrupt transitions when you are editing. Don't edit in the middle of a zoom, pan (camera movement in which the camera follows action), or tilt (camera movement that adjusts the camera view up or down). These edits usually won't work. The transition is too jarring for the viewer. There are many other dos and don'ts in editing for continuity, but the main thing to remember is to be aware of the viewer's ability to follow certain transitions and keep the message intact.

News/Sport Story

Most ENG news inserts contain four types of footage:

- o Actuality - An actuality is the coverage of the event as it occurs.

- o Interviews - A subject is answering questions or making a statement.
- o Stand-ups - The reporter talks directly to the camera.
- o Cut-ins or cut-away - These are secondary shots of action or reaction (also known as "B-roll").

A good cameraman will photograph a story or event with the editing process in mind.

While no two stories are the same, there is a basic format that the majority of the stories will follow. First the reporter introduces the story with a brief background. This is often done as a stand-up from the scene of the event. Then, other speakers, interviews, or actualities are used to fill in the details. These are referred to as "sound bites" or actualities. Finally, the reporter summarizes on camera.

There are many variations to the above formula. The experienced reporter will consistently be looking for a better way to tell the story.

BASIC EDITING PROCEDURES

The format, procedures and editing techniques will vary from person to person and from station to station. Let's assume the script has been written and the primary narration has been laid on the production tape. This is a normal news/production requirement.

When laying (inserting or assembling) the video and audio on the recording tape, the video should match the audio. A typical editing sequence might be:

- o The editor will work from a log which lists all of the scenes on the tape(s). It may be prepared at the time of the shooting or as the tape is being reviewed at the station or your office. The log will describe the scene briefly and show where it is located on the tape using the counter on the playback machine.
- o The producer, editor, and/or sometimes the reporter will decide which scenes to use, in what order, and the amount of time you have to tell the story. In smaller facilities, one person will, in most cases, do it all.
- o The editor prepares a blank video cassette with countdown leader and crystal black. The cassette is put into the edit machine and the countdown leader and enough crystal black to cover the length of the story is recorded. The cue mark is also recorded on the tape.

- o The footage (raw video) recorded on location is placed in the playback machine. The editing process is now ready to begin.
- o The story is assembled and edited according to the predetermined sequence. Sometimes the audio track is recorded first and the visuals added later and matched to the video. At other times, the sequences are assembled in order, depending on the type of story and available footage.
- o The edited tape is labeled with the title, date, and run time. Then it is reviewed by the supervisor and any corrections are made before airing.

The technical side of the editing process is fairly easy to learn. With today's technology, the procedure is almost foolproof. The aesthetic aspects of editing, however, are something else. A good editor must have a thorough knowledge of many related skills in order to provide viewers with a simple, yet effective, message.

ELECTRONIC EDITING

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The process of cutting and splicing videotape is the perfected new method.
- T F 2. When recording in the assemble mode, sound and/or pictures, are transferred to the record VCR.
- T F 3. After laying control track, you may change either to the insert or assemble mode at any time.
- T F 4. Avoid editing in the middle of a zoom, pan or tilt.
- T F 5. A cameraman should photograph a story or event with the editing process in mind.

EDITION A

Army Public Affairs Center
Fort George G. Meade, Maryland

10 Credit hours

Edition Date: September 1990

SUBCOURSE OVERVIEW

We designed this subcourse to provide you with an entry-level understanding of the operation of Electronic News Gathering (ENG) and Electronic Field Production (EFP) equipment; the selection and set up of microphones; the preparation and performance of TV news inserts; videotape editing; and the responsibilities and functions of an ENG Team Chief. This subcourse is presented in five lessons. You must have a basic knowledge of military broadcasting prior to taking this subcourse. There are no prerequisites to this subcourse. However, it is suggested you complete Subcourse DI0350, Electronic Journalism I, before taking this subcourse.

This subcourse reflects the doctrine current at the time the subcourse was prepared. In your own work situation, always refer to the latest official publications.

Unless otherwise stated, the masculine gender of singular pronouns is used to refer to both men and women.

TERMINAL LEARNING OBJECTIVE

- ACTION:** You will learn about the operation of ENG/EFP equipment; the selection and set up of microphones; the preparation and performance of TV news inserts; how to edit videotape; and how to perform as an ENG Team Chief.
- CONDITION:** You are given the material presented in this lesson.
- STANDARD:** To demonstrate competency of this task, you must achieve a minimum of 75 percent on the subcourse examination.

LESSON ONE

OPERATE ENG EQUIPMENT

46R Soldier's Manual Task: 214-177-1315

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of the operation of ENG/EFP equipment.

LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly obtain, in a field environment, video and audio for television production.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's Guide,
Broadcast Journalist, MOS 46R Skill Levels 1/2/3/4, August
1988.
Defense Information School Radio and Television Handbook, May
1982.

OPERATE ENG EQUIPMENT

INTRODUCTION

The age of the high-quality, portable mini-camera is here and here to stay (See Lesson One, Subcourse DI0350). The advent of small-format video systems truly revolutionized the television industry, particularly Army broadcasting. Where once we could only use a film camera, the Electronic News Gathering/Electronic Field Production camera has effectively replaced this older system with cost-effective, portable news gathering equipment. Not only is it portable, it can even allow the broadcaster to play back the recording on the spot. With the older film format, the process was not only time-consuming to develop and see the film, but also expensive by comparison.

Where Lesson One of Subcourse DI0350 discussed equipment common in today's ENG/EFP systems, this lesson will deal with the operation of that equipment. With advancements in technology so rapid they often make new equipment obsolete even before it hits the market, it is difficult to keep reference and learning materials up to date. Therefore, this lesson will concentrate on the type of equipment issued to United States Army Reserve Component, since that equipment is standard for more than 60 public affairs units.

Since the basic operation of equipment differs little between ENG and EFP, this lesson will address ENG with notations wherever there would be a significant difference for EFP. The primary difference between ENG and EFP is evident in the terminology. ENG is the coverage of uncontrolled events such as training accidents and fires. The pictures and story are gathered on the scene, as the events happen. EFP uses the same equipment, but under controlled circumstances. A story or script is usually written in advance. The event is carefully planned and executed until the final product is finished with predetermined results. The production of television spots, sporting events and planned events that take place outside the television studio are examples of Electronic Field Productions.

THE CAMERA

For anything to be seen by anyone on a television screen, it had to be previewed by a television camera before the introduction of digital electronics. The images that appeared were determined by what a camera could see and how it could see them. Therefore, the most obvious production element in television was always the camera. All other elements and techniques were geared to the physical and electronic

characteristics of the camera. Lighting, scenery, audio, writing, and directing all depended on the potential of the camera.

Where once they were large and bulky, cameras have evolved to smaller, lighter, more easily handled pieces of equipment. Portability, along with the advent of videotape, even allowed the television camera to replace the film camera in the gathering of news. In ENG/EFP where actual events are the topic, we are concerned mostly with portable cameras.

It is the intent and design of these portable cameras to be quickly and easily adjustable to extreme production situations. (See Fig. 1-1 Basic camera.)

FIGURE 1-1. BASIC CAMERA

There are three major parts to the television camera. They are the lens, body and viewfinder. Since they were discussed in lesson one of subcourse DI0350, this lesson will be more concerned with the effect of each on camera operation.

CAMERA BODY

The camera body consists of the housing and those parts inside it. That includes either camera pickup tube(s) or a solid state image device and the internal optical system.

The internal optical system is a series of prisms or mirrors. There are also circuitry boards, resistors, capacitors and wires. This assortment of electronics takes the visual information it receives from the internal optical system, processes it, and converts it into electronic impulses for feed to another source.

The other source can be a monitor, a videotape recorder or a system to put it directly on the air. Cameras have video out connectors through which the electronic information passes. (See Fig. 1-2 Camera Output Connector.)

Camera
output
connector

FIGURE 1-2. CAMERA OUTPUT CONNECTOR

At the front of the camera body is the Color Temperature Compensation Filter Disc, more simply referred to as the filter wheel (See Fig. 1-3 Filter disc). This enables rapid adjustment to varying light conditions with just the turn of a wheel. There are three or four positions. They are: 3200 degrees Kelvin; 5600 degrees Kelvin; 5600 +1/8 ND (Neutral Density) or +1/4 ND (see Lesson Two, Lighting for ENG, subcourse DI0350). Some cameras -not all -have a fourth position, which is a cap. The filter wheel must be set in the proper position before you white balance the camera (3200 degrees Kelvin for artificial lighting, 5600 for daylight, and +1/8 or 1/4 ND for bright sunlight). The filters will aid in the white balance process. As you learned in Lesson Two, Lighting for ENG, Subcourse DI0350, white balancing is the procedure that insures the camera can reproduce colors accurately.

FIGURE 1-3. FILTER DISC

THE LENS

As you learned in Subcourse DI0350, the lens and certain attachments to it are sometimes called the external optical system. The lens selects a certain field of view and produces a small, clear optical image of this view.

With the lens we have four primary concerns. These are: focal length, focus, f-stop and depth of field. What you need to do now is understand the functions of each, and apply them to your use as an ENG videographer.

If some things are repeated in this lesson, it is merely to save you the effort of having to go back and refer to subcourse DI0350.

Focal Length

Portable television cameras, the cameras we're concerned with, have a zoom, or variable focal-length lens, which enables them to select fields of view at different distances from the camera without moving the camera. It allows you to change the focal length of the lens from long to short and from short to long in one continuous operation.

There is an important difference between zooming in or out, and physically repositioning the camera closer or farther away. (A camera movement called "dolly in" or "dolly out." See Fig. 1-5.) The wide use of a zoom lens and its ease of operation has caused many videographers and directors to rely on the zoom when they should move the camera. A zoom lens simply magnifies or reduces an image, but it's necessary to dolly the camera to get the full three-dimensional effect. This is particularly important when moving past doorways, arches or stationary objects.

The degree to which you can change the focal length of a zoom lens is called the zoom range. To you, the operator, it's more important to know the magnification, rather than the numbers. That is something that will come only with experience. Some cameras have a "times two function," which allows you to double the focal length at any point in the zoom. That is another area where you'll need experience in order to become proficient. By recording the change from "times one" to "times two," or the other way around, you can create an interesting effect, if you do it properly.

The speed at which the focal length of a zoom lens can be changed is determined by the operator, whether it is done manually or with a zoom servo.

A zoom servo is nothing more than a small motor controlled by a lever. How far the lever is depressed determines the speed of the zoom. There are situations where a slow zoom would be better than a fast one, and other times when the fast zoom would be preferred. You'll have to develop a touch to be able to control the speed as well as a feel for the speed required in each case.

The various focal lengths of lenses have varying effects on your video. Things to consider are: field of view, perspective, distortion, depth of field, effect of camera movement and subject movement, and limitations you'll have to deal with. Subcourse DI0350 discusses these at length. Once you learn them, it will be much easier to understand how they will affect your video product. Be sure to use them to your advantage.

Focus

Focus with a lens is the same thing as focus with the eye. Sharp and clear is in focus, while fuzzy and unclear is out of focus.

Whenever possible, you should zoom focus. That means to zoom all the way in, focus and zoom back out to the desired shot. Not only does it keep more of the videospace in focus when you zoom back out, but when zoomed-in everything is magnified and you'll be able to see much finer details to focus on. That means your focus will be much clearer and sharper. Rack focus means to focus the shot where it is and, unless a certain effect is desired, is done whenever situation or time don't permit a zoom focus.

f-Stop

Since too little light falling on the pick-up tube or chip will make the picture quality suffer, it is extremely important to be sure you have enough light. Since the camera will be used both indoors and outdoors, you will have to adjust for extreme variations in light levels. You probably won't be carrying a light meter, so you'll need some way to know whenever the light level is sufficient.

Your camera has both automatic and manual iris controls (See Subcourse DI0350). Most of the time, you'll want to use the automatic control. Changing focal lengths requires a change of lens diaphragm opening and this can be accomplished more efficiently by the automatic control. It can even inform you if there is insufficient light. If the automatic iris is all the way open, the camera is seeking more light. If you move the dB gain switch to 9dB and the automatic iris doesn't close down at all, you still don't have enough light to operate the camera. It has to be very

dark to require using the 18dB gain, and picture quality suffers greatly, so use the 18dB gain only in cases of absolute emergency. EXAMPLE: A video crew at the November 1989 destruction of the Berlin wall with daylight fading and no lights on hand would have used the 18dB gain because a substandard picture is better than no picture at all.

Keep in mind, the automatic iris control will do everything for you, but it deals with the average light level for the video space. That means, if you're shooting video of someone standing in the middle of a field covered in snow, he will appear as a dark silhouette because the automatic iris will give you the opening required by most of the picture, which is the snow. As long as you are aware of this fact, you can go to manual control whenever necessary. Because of the contrast range limitations of the camera, you will come across conditions where the camera won't be able to encompass everything the eye can see. It's up to you, the operator, to know the limitations so that you can make sure that what is lost is not essential to the shot.

f-stops affect more than just the amount of light entering the camera and this is important for the ENG operator to know. They also affect the depth of field.

Depth of Field

As you know, the depth of field is that area of the field of view where the objects are in focus. You know too, that you can control the depth of field with: lens diaphragm opening, camera to subject distance and focal length of the lens. You will want to exercise that control for different purposes. You may want a shallow depth of field in order to separate your subject from the background or foreground. You may want a greater depth of field so you can move around without getting your subject out of focus too easily. The important thing is for you, the operator, to understand the basic principles and apply them properly.

THE VIEWFINDER

The viewfinder shows you what the camera sees. (See Fig. 1-4.) Since it is a miniature television, it has brightness and contrast controls. This can fool you when it comes to satisfactory light levels. What appears to be enough light in the viewfinder may not be, because the brightness control is turned up. Never rely on the brightness of the picture in the viewfinder to indicate light levels.

Use the viewfinder to frame, compose and focus the camera shots. In addition, there are a number of functions commonly displayed in the

viewfinder eyepiece. These can include any or all of the following:

- o A recording light to indicate the recorder is on or off.
- o Battery warning lights to indicate low levels in both the camera and recorder batteries.
- o A tape warning light to indicate the recording tape is nearing the end.
- o A camera db gain indicator.
- o A low light-level indicator.

FIGURE 1-4. VIEWFINDER

CAMERA OPERATION

In ENG there are a number of things you need to master, not the least of which is camera operation. Before you can operate the camera, or any other equipment, you must accomplish setup. Usually the camera and the recorder are set up at the same time. Set them up by inserting a battery or connecting an AC adaptor. When you have connected the camera and recorder with a video cable, turn the power on and check the battery charge with the camera battery level indicator. Check the videocassette for the needed red pin and insert the cassette into the recorder.

Connect the hand-held microphone (see Lesson Two, Select and Set Up Microphones) to the recorder. Connect the headphones to the recorder. Set up the needed lights (see Lesson Two, Lighting for ENG, Subcourse

DI0350), or reflectors if natural light is used. Set up the tripod.

Of course, you must learn the technical aspects. You will need to be able to white balance the camera according to the operator's manual. Likewise, you'll have to be able to record with it, but just as important, you'll need to perfect the aesthetics. You won't always have a script available to you beforehand, especially in the coverage of fast-breaking spot news. When you do have a script available prior to shooting, it's a good habit to recheck it for any additional video requirements.

Camera Commands

Television production has a language of its own, and it's important that you learn it. As we go over the different camera movements, we'll call them by name. Each name, or movement, should be referred to by that term. Everyone in the industry knows the language and can communicate effectively on a common level. EXAMPLE: It may seem nitpicky, but when talking about shooting with a portable television camera you should use the term videotape rather than "filming." After all, film is an entirely different medium and although most people who misuse the term know what they mean, it takes away all chance of misunderstanding to say what you mean.

Camera movement

There are two ways to move a camera: Changing the aim of the camera, and changing the position of the camera. EXAMPLE: As a subject moves from left to right across your field of view, you can "follow" it by changing the aim from left to right in order to keep it in your picture. You can also "follow" it by moving the camera from left to right at the same rate without changing the aim at all. That's why we use specific movement language instead of just saying, "follow it."

Pan. Horizontally pivoting the camera left or right, to change the aim of the lens while the camera remains in the same position is called panning (See Fig. 1-5). The command is "Pan right" or "Pan left". There could be more specific commands given such as "Pan right and follow," which would give guidance as to the speed of the movement. Move at the same speed as the subject. There is also the swish pan, or whip pan, which is so rapid that it creates a blur of movement.

A pan, just as any other camera movement, should never be done aimlessly or without good reason. It should have a definite starting and stopping

point, or it should be following something. Whenever possible, there should be some obvious motivation for the movement such as someone in the picture looking off to the side and then the camera making the pan to show what he sees. That won't always be possible, especially in ENG, the coverage of uncontrolled events. In all cases though, have the start and stop points fixed in your own mind. That way, the movement will be decisive and direct.

Tilt. The vertical movement of the aim of the camera lens is called tilt. (See Figure 1-5). In the language of television, the command would be "tilt up" or "tilt down." Just as with the pan, tilts should be motivated. Without good reason, any movement takes away from the value of a production. The amount of tilt is more critical than that of the pan, due to the dimensions of the videospace (3 units high by 4 units wide). Since the horizontal dimension of the screen is one third larger than the vertical dimension, there is more room for error in the panning movement, making it even more important to have the start and stop points firmly established in your mind.

Pedestal. Similar to the tilt, the pedestal movement is an up and down movement. However, it is not in the aim of the camera, but rather the movement of the camera itself without changing the aim (See Figure 1-5). The command will be "pedestal up" or "pedestal down." The pedestals that studio cameras sit on, as well as the tripods that portable field cameras sit on, have various ways to raise and lower the camera. The tripod you will be using with a portable camera will most likely have some sort of crank handle to raise and lower the camera while the aim remains the same. Quite often, the pedestal movement will be used in conjunction with the tilt movement. When this is the case, there will need to be some sort of explanation previous to the actual execution command. EXAMPLE: "When I give you the command to pedestal up, tilt down at the same time and rate, so we can keep the subject in the picture, but change our shot angle."

Zoom. We have discussed the zoom under focal length earlier. The zoom, although a movement, does not constitute movement of the camera or the aim of the camera. The only thing to add at this point is to re-emphasize that any camera movement, particularly zooms, must be motivated. The tendency for beginning videographers is to do a lot of camera moving. They fail to realize that their job isn't to create the action, but to capture on videotape the action already taking place. The command for the zoom is "zoom in" or "zoom out." There is also a special effect called the snap zoom. This is an extremely rapid zoom, either in or out, that is used to emphasize a dramatic point. It is more common in EFP than ENG and

calls attention to itself. The viewer can't help but notice it, and it should be used only for maximum effect.

Focus. The commands "zoom focus" and "rack focus" mean specific actions that the operator is to accomplish. A zoom focus is done whenever the situation and time permit. Rack focus is done when there isn't enough time to zoom focus, or for an effect. Another effect with focus that will call the viewer's attention is de-focus. This would be to begin the shot out of focus and bring the subject into focus at a designated time. It could also be done in the reverse by taking the subject out of focus to bring something else in the videospace into focus, or merely to indicate the end of the need to see the subject.

Dolly. Dolly is the movement of the camera toward or away from the subject (See Figure 1-5). The commands to dolly are, "dolly in" or "dolly out."

Crane. A crane is the movement of the camera atop a long arm of a crane. Also called a boom, this is another function that is more common in EFP. The command is "crane up," or "crane down." When referred to as a boom, it would be "boom up," or "boom down."

Truck. Truck is the movement of the camera to the right or left while keeping the aim of the camera generally the same (See Figure 1-5). Just as there is a difference between a tilt and a pedestal, there is a big difference between a pan and a truck. If a subject was traveling horizontally across the videospace and the operator just panned to follow it, the shot angle would change. By trucking we keep the angle of camera to subject the same. The command is "truck right," or "truck left." To truck to one side or the other for more than just a short distance is called a "tracking" shot. It is used most commonly in motion pictures and sometimes in EFP when the camera is going along (usually on tracks for stability) next to a moving subject. EXAMPLE: The interplay of driver and shotgun rider on a stagecoach when the scenery is flying by and the subjects remain in the same spot in the videospace.

Arc. An arc can be either a combination of truck and dolly in a straight line to arrive at a prescribed point, or a semi-circular movement to one side or the other (See Figure 1-5)

FIGURE 1-5. CAMERA MOVEMENT

The command is "arc right" or "arc left." Most often an arc is used to provide another angle of a subject while allowing the viewer to see the change of angle taking place. In some motion pictures, you may even have seen an arc go completely around a subject.

All of the camera movements and their commands apply to both studio and portable camera operation. There are some things however, that you should keep in mind when operating the portable ENG camera.

- o If you are not operating a one-piece cam-corder you must be certain that your connections to the recorder are secure and that both pieces of equipment are moved in unison.
- o Check your mounting plate and be sure not only that the camera is mounted securely to the plate, but also that the plate is mounted securely to the tripod.

Now that you know the different camera movements and what they are called, you must realize that the need for these movements comes about because your viewers rely on you to provide a visually understandable product. What you put into the videospace is important, but how you put it there is just as important. You learned the basics of framing and composition in Subcourse DI0350, Electronic Journalism. There are two different points of view that you should take regarding proper framing and composition: that of the videographer, and that of the editor. You need to know how to do both. There will be times when you will shoot for someone else to edit, and times when you will edit someone else's video. When you're shooting video, you must keep the editing process in mind whether or not you will be the one who edits the final product.

EXAMPLE:

If you are zooming in or out on a subject, you may want to do it several times, taking different lengths of time for each. One five-second zoom-in, a ten-second zoom-in and even a snap zoom. That way, the editor will have a choice of zooms to use.

When you log the video, you must speak the language of television on the chance that someone else may have to edit it. The following two examples are different ways of logging the same B-roll tape. Compare them side by side. If you were the editor, which of them would you want to have provided to you?

EXAMPLE ONE

00:00 - 00:12 LONG SHOT (LS) ESTABLISHING SCENE OF BUILDING ON FIRE

00:12 - 00:48 LONG SHOT (LS) OF FIRE TRUCK ENTERING FROM RIGHT, MEDIUM SPEED PAN LEFT TO WHERE TRUCK STOPS TO BEGIN FIGHTING FIRE

00:48 - 01:32 QUICK ZOOM IN TO MEDIUM SHOT (MS) OF MEN JUMPING OUT OF TRUCK AND RUNNING TO UNLOAD EQUIPMENT

01:32 - 02:10 MEDIUM CLOSE UP (MCU) OF WINDOW WITH FLAMES LEAPING OUT AND RUNNING UP WALL

02:10 - 03:30 MEDIUM SHOT (MS) REAR OF FIRE TRUCK WITH MEN TAKING HOSE OUT. MEN LEAVE FRAME AND HOSE COMES OUT OF TRUCK

03:30 - 04:45 CLOSE UP (CU) OF HANDS TAKING CAP OFF OF FIRE HYDRANT AND CONNECTING HOSE

04:45 - 05:05 EXTREME CLOSE UP (ECU) OF WRENCH TURNING ON WATER AT FIRE HYDRANT

05:05 - 05:20 CLOSE UP (CU) OF NOZZLE OF HOSE WITH NO WATER COMING OUT - THEN WATER COMES OUT

05:20 - 07:30 MEDIUM LONG SHOT (MLS) OF WATER BEING SPRAYED ON BUILDING

07:30 - 08:25 MEDIUM CLOSE UP (MCU) OF WATER GOING IN WINDOW WITH FLAMES LEAPING OUT

08:25 - 09:15 MEDIUM CLOSE UP (MCU) GROUND LEVEL OF HOSES LAYING ON GROUND - FOCUS ON HOSE IN FOREGROUND CHANGING TO HOSE IN BACKGROUND AND EVENTUALLY THE FIRE TRUCK

09:15 - 09:30 EXTREME CLOSE UP (ECU) OF FIREMAN'S FACE - EYES LOOKING UP AT 45 DEGREE ANGLE - FLAMES REFLECTING ON SKIN AND FIRE HAT

09:30 - 09:38 LONG SHOT (LS) OF ROOF CAVING IN

09:38 - 10:10 MEDIUM LONG SHOT (MLS) FIREMAN BEING PULLED FROM BUILDING - CAMERA DOLLY IN TO (MCU) OF FIREMAN RECEIVING TREATMENT

10:10 - 12:02 MEDIUM SHOT (MS) FIREMAN BEING LOADED INTO AMBULANCE - DOORS BEING CLOSED - AMBULANCE LEAVING SCENE, LEAVES FRAME

EXAMPLE TWO

00:00 - 00:12	SCENE OF BUILDING ON FIRE
00:12 - 00:48	FIRE TRUCK ENTERING FRAME, STOPS TO BEGIN FIGHTING FIRE
00:48 - 01:32	MEN JUMPING OUT OF TRUCK AND RUNNING TO UNLOAD EQUIPMENT
01:32 - 02:10	WINDOW WITH FLAMES LEAPING OUT AND RUNNING UP WALL
02:10 - 03:30	REAR OF FIRE TRUCK WITH MEN TAKING HOSE OUT. SHOT REMAINS STEADY AS HOSE COMES OUT OF TRUCK
03:30 - 04:45	HANDS TAKING CAP OFF OF FIRE HYDRANT AND CONNECTING HOSE
04:45 - 05:05	WRENCH TURNING ON WATER AT FIRE HYDRANT
05:05 - 05:20	NOZZLE OF HOSE WITH NO WATER COMING OUT -THEN WATER COMES OUT
05:20 - 07:30	WATER BEING SPRAYED ON BUILDING
07:30 - 08:25	WATER GOING IN WINDOW WITH FLAMES LEAPING OUT
08:25 - 09:15	HOSES LAYING ON GROUND - FOCUS ON HOSE IN FOREGROUND CHANGING TO HOSE IN BACKGROUND AND EVENTUALLY THE FIRE TRUCK
09:15 - 09:30	FIREMAN'S FACE - EYES LOOKING UP AT 45 DEGREE ANGLE TO BUILDING - FLAMES REFLECTING ON SKIN AND FIRE HAT
09:30 - 09:38	ROOF OF BUILDING CAVING IN
09:38 - 10:10	FIREMAN BEING PULLED FROM BUILDING - FIREMAN BEING GIVEN EMERGENCY MEDICAL TREATMENT - SOME CHANGE OF FOCUS DURING SEQUENCE
10:10 - 12:02	FIREMAN BEING LOADED INTO AMBULANCE - DOORS CLOSE - AMBULANCE LEAVES SCENE

Proper equipment operation is essential to ENG. It includes thinking far beyond just building the videospace. Since the electronic news gatherer is often camera operator, director, lighting director, gaffer, writer, editor and audio engineer he must be able to correctly operate all of the equipment.

So far you have learned how to operate the camera. Part of that operation is to keep in mind the points you must consider to shoot anything from a feature to a spot news story. Don't forget what you learned in Lesson Three, Framing and Composition, subcourse DI0350. Good shot composition, variance of angles, lead room and transmission loss will all come into play in all the video you shoot.

LIGHTING EQUIPMENT

You learned the principles of television lighting in Subcourse DI0350. Operation of equipment is nothing more than applying those principles. It may help you to review Lesson Two of DI0350.

RECORDING EQUIPMENT

Just as with the technical aspects of camera operation, you will have to refer to the operator's manual for the proper setup and use of your recorder. There are a few points you must remember about the use of any recorder:

- o Plug your primary audio microphone into channel two and your natural sound or background microphone into channel one. Channel two is on the inside of the tape, and protected from edge damage.
- o Plug in your headphones and listen to the audio you record. Don't just assume you are recording what you want and in the balance you want it.
- o If your recorder is not the type that is connected to the camera body, be sure the cables connecting the two are secure, and are not where someone passing by will trip over them.
- o Record some video and play it back to make sure the camera and recorder system are functioning properly.

Remember, you can always eliminate unwanted audio and video in the editing process. You can't always create the audio or video you need if it isn't there. In the operation of the recording equipment, the key is to make sure you record all you need while on the scene of the event.

A final point to remember is that along with the operation of ENG equipment must go proper care of that equipment. It is each crew member's responsibility to make sure each piece of equipment receives the best of care at all times.

OPERATE ENG EQUIPMENT

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question.

Compare your answers with the answer key on the next page.

- T F 1. Whenever camera movement is called for, the camera operator should already have the start and stop points fixed in his mind.
- T F 2. Once a good, smooth zoom has been accomplished, while videotaping in the field, it's not a good idea to waste tape by trying it again.
- T F 3. Rack focus is another term for zoom focus.
- T F 4. There are three major parts to a portable television camera: the lens, the body, and the viewfinder.
- T F 5. The degree to which you can change the focal length of a zoom lens is called the zoom range.
- T F 6. Since sports is usually a segment of the news, coverage of a sporting event is considered electronic news gathering.
- T F 7. All portable television cameras have to have a four-position filter disc.
- T F 8. A good camera operator concentrates on getting the good shots and doesn't concern himself with editing.
- T F 9. The camera lens is sometimes called the internal optical system.

LESSON TWO

SELECT AND SET UP MICROPHONES

46R Soldier's Manual Task 214-177-1201

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of selecting and setting up microphones.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly select and set up microphones for electronic news gathering productions.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's Guide,
Broadcast Journalist, MOS 46R Skill Levels 1/2/3/4, August 1988.

May 1982.

SELECT AND SET UP MICROPHONES

INTRODUCTION

According to Webster's Ninth New Collegiate Dictionary, the definition of television is: an electronic system of transmitting transient images of fixed or moving objects together with sound over a wire or through space by apparatus that converts light and sound into electrical waves and reconverts them into visible light rays and audible sound. Too often those involved in the production of television have thought of it as a visual medium and forgotten that half of it is sound.

Regardless of how good the video is, if the audio is weak, so is the production. You should plan and produce the audio with the same care and attention to detail as the video.

WHAT IS SOUND?

Before discussing the selection and setup of microphones, it's necessary to say something about the characteristics of sound. In this lesson, we'll stay very basic and give you only what you need to know to perform on a satisfactory level. Of course, if you want to learn more about sound, it will enhance your proficiency.

Sound occurs when a body vibrating back and forth creates pressure variations which are pushed outward in waves through the air. These waves travel away from the source equally in all directions, much like the ripples in a pond caused by something striking the surface.

Many things can affect sound waves, just as many things can affect the ripples in a pond. When we talk about sound from a production standpoint, we are referring to how the sound is perceived by the human ear after it has been affected by all the external influences. Also, there are important differences between the physical properties of sound and how we actually hear it. All the various factors involved would be too detailed to discuss now, but there are two important factors you should be familiar with to work with television audio. They are sound frequency and sound intensity.

Sound Frequency

The sound waves of a vibrating body go in cycles and can be illustrated by a "sine wave" (See Fig. 2-1 Sound Waves).

Each cycle is measured from the beginning of one wave to the beginning of the next. The number of complete waves, or cycles, per second determines

the frequency of the sound. This is called hertz (Hz). That is why a thousand cycle tone is the same as a thousand hertz tone. The height of the waves is the amplitude, or loudness. We measure this in decibels (dB).

The faster the vibration of the body, the more cycles produced and the higher the pitch of the sound. For example, the number of cycles per second produced by a train's whistle is far greater than the number of cycles per second produced by a ship's fog horn. They may both have the same intensity, but they have very different pitch. The human ear can perceive from 16 Hz to 16,000 Hz. Of course, some people hear better than others, but this is the general range. Normal hearing is most sensitive to sounds between 500 Hz and 4,000 Hz. This is the range of sound frequency most important for understanding speech. Professional audio equipment is capable of reproducing sound frequencies from about 16 Hz to 20,000 Hz, which is the full audio spectrum necessary to pick up and reproduce sound and music accurately.

FIGURE 2-1. SOUND WAVES

Sound Intensity

Sound intensity is directly related to the amount of energy expended in creating the vibrations. For example, the harder you hit a drum, the louder it sounds. The increase of pressure through a whistle increases

the loudness of the sound. In both cases, the pitch remains the same, but the volume goes up.

As previously mentioned, loudness or sound intensity is measured in decibels (dB). It's also important for you to understand how the decibel scale works. We sense the difference in two sounds by comparison rather than by a particular measurement. You can't tell how many decibels a sound is just by listening, but you can tell which of two sounds is louder.

The decibel scale is a logarithmic scale. A doubling of the intensity is represented by an increase of 3 dB. In other words, whenever we double or halve the intensity of a sound, we change it by 3 dB. A change from 3 to 6 dB is doubling the sound intensity. A doubling of 9 dB would not be 18 though. It would be 12. (An increase of 3.) And of course, the same goes for lessening the loudness.

You should be familiar with the decibel scale because it is often used in audio production to refer to audio levels. The common VU meter on audio boards is calibrated in decibels and percentage of modulation (See Fig. 2-2 Volume Unit Meter).

FIGURE 2-2. VOLUME UNIT METER

TYPES OF MICROPHONES

There are two basic parts common to all microphones: The diaphragm and the generating element. The diaphragm is a flexible device, sensitive to the air pressure variations created by sound waves. The generating element is attached to the diaphragm, and converts the vibrations into electrical energy. This is not unlike the camera lens and the camera, where the lens captures the visual images and the camera converts them into electronic signals (See Figs. 2-3, 2-4 & 2-5 Microphones).

Selecting The Correct Microphone

Begin by conducting an acoustical analysis. You do that by assessing how audio will carry or be distorted in the recording environment (e.g., studio, empty room, room filled with furniture, small room, room with high ceiling, outdoors, etc.). While doing this, keep in mind the microphone types and pickup patterns of the microphones available. Then take into consideration any possible audio problems. This applies to both your ENG and your EFP work. Think not only about the primary audio and the equipment required to best achieve the required result, but about the background audio, or wild sound as well. Select the type of microphone that will provide the best pickup for the situation. There are three primary types of microphones you will deal with: Dynamic, Ribbon and Condenser.

The *DYNAMIC* microphone is durable and excellent for outdoor use as a production microphone. This type of microphone is the least vulnerable to distortion and the most common in use in ENG. (See Fig. 2-3, Dynamic Microphone)

FIGURE 2-3. DYNAMIC MICROPHONE

The *RIBBON* microphone is fragile and sensitive to strong, loud or sudden sounds that can damage the ribbon. This microphone should be used indoors. It is desirable for use on announcers, singers and musical instruments. It's not as good for ENG since you'll need more control over separation. You'll need to separate primary audio and wild sound more than this microphone will permit. Remember too, you have little or no control over strong, loud or sudden sounds outside the studio that would harm the ribbon microphone. (See Fig. 2-4, Ribbon Microphone)

FIGURE 2-4. RIBBON MICROPHONE

The *CONDENSER* microphone generates a low signal and needs a pre-amplifier to boost its strength. It requires a separate power supply, which is large and bulky. This makes the use of this microphone difficult for ENG since one of the main concerns of the ENG team is to lessen the amount of equipment rather than add to it. The condenser microphone provides the highest quality of sound of the three types of microphones. Although it is too sensitive for outdoor use, it is excellent for music pickup. Its use in ENG/EFP would be limited to something such as a video spot for the U.S. Army Band. (See Fig. 2-5, Condenser Microphone)

FIGURE 2-5. CONDENSER MICROPHONE

PICKUP PATTERNS

When selecting the microphone, consider the various pickup pattern of each microphone.

The *OMNIDIRECTIONAL* microphone picks up sounds coming from any direction equally well. This microphone is recommended when one microphone must cover a wide area or when unwanted noise is not a problem (See Fig. 2-6 Pickup Patterns).

The *UNIDIRECTIONAL* microphone picks up sounds coming from one direction and suppresses sounds coming from the rear and sides. It is recommended if unwanted noise is a problem. Unidirectional pickup patterns have three general categories: bidirectional, Cardioid, and supercardioid (See Fig. 2-6, Pickup Patterns).

The *BIDIRECTIONAL* microphone picks up sound coming from directly in front and in back. This microphone is not good for television because it picks up studio noises. It is good for two people who face each other, as in the old radio drama, but in television the side opposite the performer is usually the camera and behind the scenes (See Fig. 2-6, Pickup Patterns).

The shape of the *CARDIOID* pickup pattern is similar to that of a heart, as you would suspect from its name. Most cardioid microphones are sensitive to about 120 degrees on either side of straight forward, although this can vary somewhat. The advantage of some directional isolation in addition to a wide audio pickup range makes this a good microphone for television. Even when the performer is some distance away from this microphone, it will produce better quality sound than an omnidirectional microphone.

The *SUPERCARDIOID* is the most highly directional pattern, and is designed to pick up sound within a very limited range. Often called a shotgun microphone, the biggest drawback to this type of microphone pickup pattern is its highly unidirectional shape. Unless the microphone is pointed directly at the sound source poor audio quality will result. Its advantage is in its ability to pick up sound at far greater distances (See Fig. 2-6, Pickup Patterns). Even though it is designed to pick up sound at greater distance, the closer the source, the better the sound that will be reproduced.

The points to remember when considering the pickup patterns of each microphone are the desired mixing or separation of sounds for the production, the likelihood of unwanted sounds occurring during shooting and the amount of gear to be transported to the shoot site. There is really no best microphone pickup pattern. Each is designed for a

particular situation. The trick is to let the microphone's pickup pattern work for you by focusing on the sound you want and eliminating the sound you don't want. An interview taking place next to a busy highway, for example, would be better conducted with a unidirectional rather than an omnidirectional microphone (See Fig. 2-6, Pick-up patterns).

FIGURE 2-6. PICK-UP PATTERNS

IMPEDANCE

Another important factor for you to understand about microphones is impedance. Impedance is the amount of resistance in a circuit. Low impedance means little resistance and a greater current flow, while high impedance means greater resistance and lesser current flow. The numbers are not important for you, as an operator, to know. They are more important to engineers, but you need to understand two important facts: Low impedance microphones permit the use of long cables without

significant loss of signals, and a microphone's impedance must always match the input connector impedance on a tape recorder or audio mixer. That means if your recorder uses a high impedance input connector, you will have to use a high impedance microphone, and therefore, a relatively short cable of approximately ten feet or less, or a transformer designed to match the low impedance of the microphone and the high impedance of the recorder. Of course, this will be of more concern to the ENG team chief than it will to the videographer, but remember, you could very well be both.

PLACEMENT OF MICROPHONES

Another consideration when selecting a microphone is its placement. This is dictated by the subject or situation. Since we're talking about video, the appearance of the microphone is also important to consider. Very often when an interview takes place, the microphone has a flag (little symbol that identifies the station or unit producing the piece) in view of the camera. Of course, it shouldn't be a distraction.

The *LAVALIER* microphone is most commonly used for studio television, but can sometimes be used in the field when it is necessary for the talent to have his hands free. It is always omnidirectional, and the speaker talks across, rather than directly into it. It should be placed on the lapel in the direction the performer will face and NOT under any clothing. Production personnel should place the microphones on non-professional talent. A guest who puts on his own microphone will worry about how it looks instead of sound quality.

The *DESK* microphone is positioned in the direction the talent will face on a desk or tabletop. It is sensitive to desk noise. Use a foam rubber pad under the microphone stand to eliminate some of this problem.

The *HAND* microphone is commonly used for television reporting in the field. The interviewer has complete control over positioning because he is holding the microphone. A backup to this microphone could be a *BOOM* microphone suspended above the sound source. It can be suspended mechanically or handheld.

The *STAND* microphone is basically a hand microphone positioned on a stand and therefore quite common in ENG/EFP. On a stand it is used by singers or near musical instruments.

The *HEADSET* microphone is used when an off-camera announcer needs to have his hands free. It's used frequently for sporting events, which are EFPs.

The *WIRELESS* microphone is any small microphone with a battery-powered transmitter. It does not have a cord, and allows for free movement.

The *SHOTGUN* microphone is a long, tubular microphone and is highly unidirectional, (Remember the supercardioid pickup pattern). It can be several feet from the speaker. This microphone locks in on the main source of sound while eliminating extraneous noise. It is very useful when you can't get near the source.

CABLES AND CONNECTORS

In most cases, the output of microphones must travel through a cable in order to reach the recorder. This requires the use of special audio cables, connectors and receptacles. We'll talk about them separately.

Cables

An audio cable is two wires inside protective insulation. At each end is a connector. The exception is the lavalier microphone. The lavalier is connected permanently to its cable and there is only one connector on the other end of the cable. On most others -- hand, desk, stand, and boom microphones -- there is no permanently attached cable, but a female receptacle in which to plug a cable.

Cables have a natural coil or curve to them. You should follow it when you wind them up for storage. Failure to do so can result in damage to the wires inside the cable and cause audio problems. It is never a good idea to wind the cable around your elbow. It is also not a good idea to tie the cable off by its ends. Twist ties or pipe cleaners work well for holding the cable together.

When running audio cable, always have sufficient length for any movement that may be necessary. It's also a good idea to have a minimum of cable visible in your picture. Avoid stepping on your audio cable and take the necessary measures to prevent others from doing so as well.

Connectors

Professional microphones and cables use a standard connector called a cannon plug. It is actually a cannon XLR with three-pronged male and

female plugs, (See Fig. 2-7, Microphone Connector Plugs). Most audio outputs use a male plug and most inputs use a female receptacle. They lock into position when connected. This is a safety precaution to make sure they don't come apart during use. The male plug has a release button that must be pushed to disconnect.

FIGURE 2-7. MICROPHONE CONNECTOR PLUGS

WIRELESS MICROPHONES

Wireless microphones, as the name implies, operate without any cables. They give you all the advantages of a lavalier or hand microphone without the restrictions of cables.

The wireless microphone is a conventional lavalier or hand microphone connected to a small battery-powered transmitter. The signal is transmitted through a small antenna on an FM radio frequency to a receiver. The output of the receiver can then be fed into a camera, a recorder or an audio console.

Many hand-held wireless microphones have the battery and transmitter in the microphone case. You may have seen singers performing into a microphone with a little antenna protruding from the bottom of the case. The transmitter and battery for wireless lavalier microphones are in a pocket-sized unit that is easily carried by the performer while allowing his hands to remain free. This can be beneficial in any number of applications.

Early models of the wireless microphone were subject to interference from many sources, such as taxi and police radios. Newer RF microphones use a diversity receiving system which is designed to prevent those problems. Wireless microphones with the diversity receiving system are reliable and dependable.

The transmission range of wireless microphones is anywhere from 50 to 1000 feet depending on conditions. Of course, you'll want to position your receiver as close to the microphone as you can.

The one disadvantage of the wireless microphone is cost because a separate transmitter and receiver is required for each microphone. The advantages of freedom of movement and increased range, may or may not be worth the expense.

FILTERS

Microphones are susceptible to loud, sudden sounds and wind noise. Pop filters and screens are used on microphones to diminish these sounds. Pop filters are built-in, usually in dynamic microphones. They are excellent against distortion. Windscreens are externally mounted but cannot eliminate loud distortion. Filters are most used when reporting in the field.

THE RIGHT TOOL FOR THE JOB

Determine the number and type of microphones, cables and filters needed. Base this upon the information provided to you in the script, your acoustical analysis, and your decision on the type, pickup pattern, and position(s) of your microphone(s). The types of microphones you use and their positioning will be based on your subject and the situation.

THERE'S MORE TO IT

For ENG we must also consider spare microphones and cables. Carry this a step further and be sure you have spares for any of your equipment. Once you're out in the field, you won't have the chance to run into the equipment cabinet to replace a burned out bulb, or an audio cable that doesn't work. Check all of your audio equipment. Speak into or across each microphone in a normal voice. If any are not working, check the connector cables and make sure the microphones are switched "ON." If a microphone doesn't work, replace it. If audio feedback or interference occurs, reposition the microphones until the problem is eliminated.

Do this in the station/studio/office. Then take spares along anyway. Just as with all the equipment necessary for the production, your checklist should include spares for any equipment that could malfunction and keep you from completing your mission.

Finally, there is no substitute for planning in ENG and EFP. Audio is as much a part of any ENG/EFP piece as video even if it's only natural or background sound. After all the planning it is still important to not take shortcuts while shooting. Use the headsets to actually hear the audio that is being recorded. Don't take-for granted that it'll be there and spend all your efforts on video only. Once the event has taken place and you return to your editing suite, there is no going back for something you missed, and if you don't have everything, including audio, all your time and effort is wasted.

PRACTICE EXERCISE

LESSON 2

SUBCOURSE NO. DI 0351

SELECT AND SET UP MICROPHONES

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Audio is the one area of ENG where you can afford to take shortcuts.
- T F 2. A shotgun microphone is also called Bidirectional.
- T F 3. All ENG microphones have a diaphragm.
- T F 4. Modern wireless microphones are still subject to interference from taxi and police radios.
- T F 5. Sound frequency is measured in decibels.
- T F 6. Sound is pressure variations in the air which travel in waves.
- T F 7. Sound amplitude is measured in hertz.
- T F 8. A VU meter is calibrated in decibels.
- T F 9. Omnidirectional means only in one direction.
- T F 10. Some microphones have built-in filters.

Television Handbook, May 1982.
Defense Information School, Broadcast
Journalism Style Guide

PREPARE/PERFORM TV NEWS INSERTS

INTRODUCTION

The preparation and performance of television news inserts are the meat and potatoes of the electronic journalism business today. This is true in both the civilian and military worlds. In the civilian world, there are entire networks concerned with news only, (and advertising, of course). The public affairs mission of the Army is divided into public information (PI) and command information (CI), both of which can often best be served in a news format.

Your role as videographer, (already covered in the operation of ENG equipment under camera operation), writer, announcer, editor, director or assignments manager will require you to know a lot about the preparation and performance of television news inserts. In this lesson, we'll address the things you'll need to know for announcing, writing, scripting, interviewing and editing. What you'll need to know about assignments manager responsibilities will be covered latter in this subcourse.

WRITING

Writing and scripting, although two slightly different elements, are so closely related that we'll cover them together. Of course, all the principles covered previously under announcing, even though they were mostly aesthetic elements, will still apply and we'll be mentioning them again. Now we'll pay more attention to the mechanics. Some things may seem redundant to you, and they probably are. Remember, we have already talked about a lead, for example. We talked about what it is supposed to accomplish, the two basic types of leads and so forth. When we again talk about leads, even though we will be stressing the mechanics, we'll again touch on some of the aesthetics of them.

Procedures and Limitations

The ability to write comes from much learning and practice. It's difficult, if not impossible, to teach someone to write, much less write well, in one short lesson. The efforts of this lesson will be directed toward giving you the rules that must apply to broadcast writing and how it differs from writing for print media. The best way to learn to write is to -- write, write, write. It also helps to read a lot. Observe the writings of others.

When writing for broadcast, you should apply six "C's". They are; **CLEAR, CONCISE, CONVERSATIONAL, COMPLETE, CURRENT**, and most importantly, **CORRECT**. Let's address each of these points, one at a time.

Clear. Broadcast copy must be clear. If something isn't clear, the reader, listener/viewer won't understand it, and he can't go back over it since it's being read to him by someone else, who isn't going to repeat it. Once gone, it's gone forever.

Concise. Writing concisely adds to clarity and saves air time, allowing two or three more stories to be included in a 30-minute newscast.

Conversational. The copy is going to be read to its intended audience and it should be done in a conversational manner, something that would be possible only if the copy were conversational in the first place. Read it aloud before you turn it in to your editor or air it yourself.

Complete. Your writing must answer all the pertinent questions --the who, what, when, where, why and how. News stories should answer questions, not raise them.

Current. Here again, there are some exceptions, although usually even when something is presented as being of or about another time, it is presented as in the present. For example, even if we receive something that is of a historical nature, we perceive it in the here and now. We never lose sight of the fact that that's where we are, so the copy shouldn't either.

Correct. The importance of being correct cannot be stressed enough. The broadcast media hold a certain credibility with the majority of people. "I saw it on television" is enough proof for many people. This is both good and bad. It adds a certain value to those things we say in our video scriptwriting, but it requires us to work extra hard to ensure something's accuracy. The structure of a news story for broadcast usually differs from that of the print media. The first thing in the broadcast story is the "WHAT". This will attract the listener's attention and alert them to what is about to follow: the details. Since viewers cannot absorb all the facts in the first line, they must be given them in a form that will enhance understanding. Instead of What happened to whom, when and where with a why thrown in and then explaining it in the rest of the story, broadcast style is more like "What happened," "It happened where and when," "This is why it happened," and we'll put in the how if we have it.

The Lead

The lead sentence should have enough information about What happened to arouse the listener's interest, without passing on too much information for the listener to comprehend. A lead sentence should be 20 words or fewer and contain as much information as possible without overloading the listener. A good idea is to begin the sentence with one or two words that are NOT the essential information in the story. Don't begin with essential numbers for the same reason. Much of the time, the viewers' minds aren't geared for the story and it takes a word or two for them to be fully alerted to receive the essential information. Usually, a lead can be made much better by changing it around a little. EXAMPLE: "130-THOUSAND SOLDIERS COULD BE CUT FROM THE ARMY IN THE NEAR FUTURE, IT WAS ANNOUNCED TODAY." This would be more assured of the listener's understanding if it were worded "THE ARMY ANNOUNCED TODAY ANTICIPATED MANPOWER CUTS OF 130-THOUSAND IN THE NEAR FUTURE."

The Body

After the lead, the story must have a logical development. This is the body. It's, quite simply, telling the rest of the story in an orderly fashion, flowing smoothly to an end. Of course, the most important fact will come next and the next most important fact next, and so on. This is important in broadcast writing because air time is limited and valuable. Typically, the same story will be divulged in both the print and broadcast media. It isn't at all uncommon for the broadcast version to be only one tenth as long as the print version.

Tense. The natural tense for broadcast copy is the PRESENT TENSE, since most news reporting is of current, or at least, very recent news. However, every story doesn't have to sound as though it happened in the last minute. As a matter of fact, many events that the audience knows are in the past must be reported in the past tense. A good example of this would be in reporting sports scores. It's acceptable to headline something in the present tense to entice the audience to come back after a break, such as "Ohio State upsets Notre Dame...that, and the rest of the sports scores right after this." But the fact that they are final scores makes them past tense and they should be reported as such.

Voice. Broadcast copy should be in the active voice. The active voice has the subject of the sentence doing the action rather than the subject receiving the action. It's not only quicker, it's more conversational and carries more impact.

EXAMPLE:

Passive: THE EVIDENCE WAS GATHERED BY THE POLICE DEPARTMENT.

Active: THE POLICE DEPARTMENT GATHERED THE EVIDENCE.

Write for the ear. In keeping your copy conversational you'll be writing for the ear. Your video will enhance the audio, but the audio must be able to stand alone. It is for this reason that we refer to broadcast writing rather than just television writing. Remember, blind people listen to television and much of the time, sighted people listen to television while they're doing other things. Use everyday language. Write as people speak. Use contractions.

EXAMPLE:

Bad: WHEN QUERIED, IT WAS INDICATED BY THE POLICE
CHIEF THAT AN ARREST WAS IMMINENT.

Good: WHEN ASKED, THE POLICE CHIEF SAID AN ARREST WAS
IMMINENT.

Sentence length. Keep sentences short. They're easier for the newscaster to read and easier for the audience to understand. Remember, the lead should be 20 words or less and the rest of the sentences should be 25 words or less. Even though they can be 25 words long, sentences other than the lead should only average 17 words. They should vary in length to avoid a pattern effect. For spot announcements, the maximum sentence length should be 17 words. Shorter sentences give a feeling of action and urgency, but it's also easy to sound choppy if you're not careful to vary the sentence length within the word limit.

EXAMPLE:

Since they were not forwarded for a final vote, they can be resurrected only by a two-thirds vote of the house or by being added to bills under consideration later in house-senate conference committees, in which conferees try to reach agreements on bills that have passed the house and senate but in different forms.

This example is a sentence that was taken directly from a daily newspaper in a major American city. It illustrates the need to shorten sentences for broadcast copy. If you can go over it again, you can understand it, but try to read it aloud and make yourself understood. By dividing this

56 word sentence into four sentences of 14, 9, 15 and 19 words, we make it much clearer.

THE BILLS WEREN'T FORWARDED FOR A FINAL VOTE, BUT THEY
CAN STILL BE RESURRECTED. ONE METHOD IS TWO-THIRDS
VOTE BY THE HOUSE. ANOTHER IS BY ADDING THEM TO BILLS
UNDER CONSIDERATION LATER IN HOUSE-SENATE CONFERENCE
COMMITTEES. THESE COMMITTEES TRY TO REACH AGREEMENT ON
BILLS THAT HAVE PASSED THE HOUSE AND SENATE, BUT IN
DIFFERENT FORMS.

Quotations and attribution. It takes a little subtlety on the part of the broadcast writer when it comes to quotations and attribution. In the printed format, it takes nothing more than putting something in quotation marks. However, the listening audience can't see quotation marks. This can be overcome with the use of phrases like, "he said" with a slight pause before the quoted words or a faint change of tone. This will leave no doubt in the mind of the listener that he is hearing the exact words of the original speaker.

EXAMPLE:

THE CHIEF PETTY OFFICER WAS ASKED FOR HIS OPINION, AND
HE SAID,...."I THINK SHE'S THE FINEST SHIP AFLOAT."

When it is absolutely necessary to remove all chance of doubt from the listener's mind, you can use "QUOTE" and "END QUOTE." However, this is disconcerting and certainly unconversational and you should avoid it when you can. If you're quoting someone and it's necessary to use a long quote, don't worry about rules for sentence length. Avoid long quotes whenever possible for obvious reasons. When you have to link the speaker with the quote, use conversational phrases.

EXAMPLE:

THE CHIEF ADDED....
or
HE CONTINUED BY SAYING...

It's usually a good idea to identify your source as quickly as possible. We don't want the listener/viewer to miss any of the important information because he's trying to figure out who is being quoted.

Credits. When quoting source material, since we can't use footnotes, we need to give oral attribution to both the source and its author, and it should be done in the first reference. Then in subsequent references we can attribute either the source or the author.

EXAMPLE:

IN THE "NINTH NEW COLLEGIATE DICTIONARY", MERRIAM
WEBSTER PUT THE ACCENT ON THE FIRST SYLLABLE IN THE
NOUN, "ATTRIBUTE." WHEN IT'S A TRANSITIVE VERB,
HOWEVER, THE ACCENT IS PUT ON THE SECOND SYLLABLE.

Whenever a production is going to require a lot of attribution, it can be done all at once in the form of credits at the end. It can be done with a crawl by the character generator as well as by an announcer. It wouldn't hurt to include the credit in the copy since the video can be missed by anyone in the audience who is just listening. Of course, known facts need not always be credited. EXAMPLE:

IT'S TIME FOR ALL OF US TO REMIND OURSELVES TO,
"ASK NOT WHAT YOUR COUNTRY CAN DO FOR YOU; ASK WHAT
YOU CAN DO FOR YOUR COUNTRY."

As a broadcast writer, you must exercise careful judgment in determining whether such material is sufficiently original or identifiable with its author or source as to not require credit.

Numbers

From one to nine. Write out: ONE, TWO, THREE, etc., unless they are being used for sports scores, times, dates or telephone numbers.

From 10 to 999. Use numerals: 10, 20, 30, 128, 925, etc.

More than 999. Both of the preceding styles apply with one slight addition. Substitute for the zeroes, words that mean what those zeroes represent, such as: ONE-HUNDRED, 15-HUNDRED, THREE-THOUSAND or 71-BILLION, etc.

Dates. JANUARY 1ST, JUNE 29TH, JULY 4TH, etc.

Years. Four digit numerals such as 1980 or 1995.

Money. 10-THOUSAND DOLLARS, TWO-MILLION YEN, 29-D-MARK.

Fractions. TWO-THIRDS, ONE-FOURTH, 17-THIRTY SECONDS.

Percentages. FIVE PER CENT, 22 PER CENT.

Telephone numbers. 542-4014 or EXTENSION 4-0-1-4 (for emphasis)

Addresses. ONE WEST EAGER STREET, 65505 NORTH 69TH AVENUE.

Building numbers. BUILDING ONE; BUILDING 400; etc.

Ages. THREE-WEEK-OLD BABY, 21-YEAR-OLD PRIVATE.

Time. 9:00 THIS MORNING or NINE A-M.

Decimals. 15-POINT-FIVE or FIVE-POINT-TWO.

Roman numerals. LOUIS THE 16TH, POPE JOHN PAUL THE SECOND.

Ratings. NUMBER SIX ON THE CHART, RANKED 26TH BY THE AP WRITERS.

Scores. 7 TO 3, 19 TO 12, 35 TO NOTHING.

License. B-R 549

Military units. SECOND BATTALION, 82ND AIRBORNE, SEVENTH ARMY. (Written as spoken)

Equipment designations. M-16 RIFLE, C-FIVE-A "GALAXY", C-ONE-30 "HERCULES"

Punctuation

The period. As in any writing, the period indicates the end of a sentence or thought. More periods are used in broadcast writing because broadcast news sentences are shorter and more conversational.

The comma. A comma indicates a pause shorter than that of a period. Geographical names and most items in dates and addresses are also set off by commas.

EXAMPLE:

WE MOVED FROM FORT BRAGG, NORTH CAROLINA, ON JUNE 29TH,
1985.

The dash. Use the dash to set off appositives and other parenthetical expressions.

EXAMPLE:

NATO -- THE NORTH ATLANTIC TREATY ORGANIZATION -- IS
PRIMARILY RESPONSIBLE FOR....

The hyphen. Use the hyphen to help announcers in phrasing difficult words and to instruct them to pronounce individual elements distinctly.

EXAMPLE:

RE-ADJUST, RE-EVALUATE, W-A-B-C, F-B-I, U-S, A-M

DO NOT hyphenate or divide a word at the end of a line. Spell out the entire word OR move it to the next line.

The dots. Occasionally, you can use a series of three dots to indicate a pause longer than that of a comma. The series of three dots can be used for dramatic effect:

EXAMPLE:

THE JURY FOREMAN ANNOUNCED IN A CLEAR FIRM VOICE...
"INNOCENT!"

The quotation marks. In addition to their normal use for indicating quotes, the quotation marks can also be used to set off nicknames, titles of books and plays, etc.

EXAMPLE:

THE ONE-HUNDRED FIRST AIRBORNE DIVISION -- BETTER KNOWN
AS THE "SCREAMING EAGLES" -- MAKES ITS HOME AT FORT...

Parentheses. In broadcast copy, material in parentheses is information for the announcer, and normally not meant to be read aloud. It includes notes to the announcer such as pronunciation guides, a date, reading rates, etc.

EXAMPLE:

COLONEL PAYKEN (PAY-KEN) ARRIVES ON SUNDAY (MAY 21ST).

Speaking Of Words

Remember, anyone can turn on a radio or television set. Choose words that everyone will understand, the announcer as well as the listener. Don't expect things of your audience. Make your copy clear and understandable.

Contractions. In day-to-day conversations, contractions are used liberally. "It's" instead of "it is," "they're" instead of "they are" will make your copy more conversational. A couple of exceptions to this are the "it will" contraction, "it'll," and "they will," "they'll," which are awkward to the ear.

Pronouns. There is a danger in using personal pronouns in broadcast copy. You must be sure your audience knows who you're talking about whenever you use "he," "she" or "they." The ear can't go back and pick-up the identification.

Alliterations. When you compose a sentence consisting of several words beginning with the same vowels or consonants, you have alliterations and the announcer has a problem.

EXAMPLE:

THE WESTERLY WINDS WILL WHIP WRATH WITHIN WINDSOR...

or

THE DEVASTATED DAM DUMPED DRUDGE AND DIRT ON DES MOINES

Sibilant. Too many "s" or "sh" sounds tend to create a hissing sound when read aloud.

EXAMPLE:

THE SIXTH SICK SHIEK'S SIXTH SHEEP'S SICK

And of course, you should always be aware of how difficult your copy will be to read aloud. Try it yourself if you have any doubt. This can be a second reason for reading your copy aloud in addition to double checking it for time. We'll discuss how to time your copy later.

Homonyms. Watch out for homonyms, words which sound alike but have different meanings. The listener can't hear the difference between "won" and "one," "bear" and "bare."

Here and there. Since your listeners could be anywhere, "here" and "there" can mean something different to each of them and change the meaning of your copy. These words can be avoided simply by calling

"here" or "there" by its name. If "here" is Fort Knox, say "FORT KNOX."

Libelous words. A libelous word would be any word that, if used improperly in your story, could lead to libel. Be very careful with words like: atheist, fascist, seducer, bigamist, rapist, murderer, illegitimate, deadbeat, addict, etc. Be especially careful with the word "for." Saying someone has been arrested "for murder" implies guilt. Instead say something like "arrested on a charge of murder" or "arrested in connection with the murder of..." Keep in mind also that until someone is convicted of a crime, they are only a "suspect" or the "accused" and their act is "alleged."

Not, "not." Avoid the use of the word "not" in your copy. "Not" can easily be dropped inadvertently and leave the listener wondering if he heard "not" or not.

EXAMPLE:

<u>Use</u>	<u>Avoid</u>
DISHONEST	NOT HONEST
INNOCENT	NOT GUILTY
FORGOT	DID NOT REMEMBER
UNABLE	NOT ABLE

Other meaningless words. Avoid meaningless words like "latter", "former" and "respectively" when referring to persons, places or things already mentioned. Again, listeners can't refer back. Likewise, avoid transitional phrases within your stories such as "meanwhile," "meantime," "incidentally." They're crutches. While each thought, phrase or paragraph should flow to the next, it should be done with skillful organization, not throwaway transitional words.

Steer clear of flowery phrases and trite expressions that take up time and space and add nothing. Avoid slang, vulgarisms and dialect in news writing.

Always translate military jargon, technical, legal and foreign terms into simple language.

EXAMPLE:

<u>Use</u>	<u>Avoid</u>
ASSIGNED	DETAILED
BEFORE	PRIOR TO
ENLISTMENT	HITCH
IF	IN THE EVENT OF
SAID	CLAIMED

Good taste. What can we say about good taste? It's relative. It's very easy to be misunderstood, and even when your meaning is quite clear, there's a chance that someone will feel it's in bad taste. You MUST, therefore, take all precautions to be sure your words, phrases and manner of presenting information will not embarrass your command, your service, or the United States Government.

Handling Titles and Names

Don't lead off a broadcast story with a person's name if you can avoid it. In the case of names and titles being used together, precede the name with the title. It should be, "SPECIAL AGENT ELLIOTT NESS," not "ELLIOTT NESS, SPECIAL AGENT." This alerts your listener that a name is coming up and gives them a better chance to comprehend your story.

Official titles

Refer to federal office holders by title or as "mister" or "ms." That is SENATOR JONES or MISTER JONES...CONGRESSMAN SMITH or MISTER SMITH...CONGRESSWOMAN BROWN or MS BROWN...

Difficult names. Whenever a difficult name isn't essential, use the person's title, such as "THE FOREIGN MINISTER OF SWEDEN..."

Initials. It's best to omit initials in a person's name unless it is a well-known part of the person's name such as HOWARD K. SMITH or MICHAEL J. FOX or F. LEE BAILEY. The other exception is when the nature of the story requires further clarification, such as births or deaths.

Phonetic spelling. If there's any way for an announcer to mispronounce a difficult or unusual name, assume he'll do it. So give him all the help you can. Write the phonetic spelling in parentheses, and place it immediately behind the troublesome word. Be sure to underline the phonetic syllable that is to be accented or stressed.

EXAMPLE:

SERGEANT KOLLMAN (COAL-MAN) ENTERED...

MUNICH (MEW-NICK), GERMANY IS THE CAPITOL OF....

Make sure the phonetic spelling appears on the same line as the word it represents.

When abbreviations are used, they are intended to be read as abbreviations. The use of well-known abbreviations is permissible, such as...Y-M-C-A, F-B-I, U-S, A-M, or P-M. You may also use MR., MS., and DR. "ST." may be used instead of "SAINT" as in ST. LOUIS.

Do not abbreviate military ranks or installation names. Use CAPTAIN CARLISLE (not CPT.), STAFF SERGEANT BAILEY (not SSG or SSGT.). Use FORT (not FT.) KNOX. Use NAVAL AIR STATION (not NAS). UNITED STATES or U-S AIR FORCE (not USAF).

Other Considerations

Abbreviations. A good rule to remember on the use of abbreviations in broadcast copy is...WHEN IN DOUBT, WRITE IT OUT. Hours and hours of extra time spent in writing things out isn't worth trading for one moment's embarrassment on the air. Consider as well, the additional chance of misunderstanding on the part of the listener.

Never abbreviate names of states, cities, countries, political parties (except G-O-P), days of the week, months, titles of officials and address identification such as street, avenue, drive or boulevard. Never start a sentence with an abbreviation, word, or number. WHEN IN DOUBT, WRITE IT OUT.

Acronyms. When using an unfamiliar abbreviation or acronym that will be pronounced as a word, be sure to spell it out in the first usage.

EXAMPLE:

"THE DEFENSE INFORMATION SCHOOL, COMMONLY CALLED DINFOS.."

"CHAMPUS - THE CIVILIAN HEALTH AND MEDICAL PROGRAM FOR THE
UNIFORMED SERVICES - HELPS SERVICEMEN AND THEIR FAMILIES."

All-CAPS or Upper/lower case. Do you type broadcast copy in all-caps or upper and lowercase letters? Some newsrooms favor an all-caps format for consistency with copy coming over teletypes. Studies, however, show that copy typed in upper and lowercase letters is easier to read. One thing to consider when using upper and lowercase is the chance of failure to capitalize, which could confuse an announcer and cause him to stumble.

Timing your copy. The total line count of a broadcast news release is the most common measure of the length or time. In television scripts, the storyline, or audio, shares the page with the video. Therefore, with only half the page for the story content, the typewriter margins are set for an average of 35 characters or spaces per line. As a result, 14 to 16 lines of television copy will average 30 seconds, or two seconds per line.

Total word count. Though not the preferred method, the length or time of a broadcast news release can also be measured by total word count. Announcers read at varying speeds, but the average is two-and-a-half words per second. This would mean approximately 150 words for a 60-second story.

Numbering pages. Whenever your broadcast copy is more than one page, pages are numbered consecutively: 1 of __, 2 of __, 3 of __. If your script is 10 pages long, the first page would be numbered 1 of 10, and the last page would be numbered 10 of 10. Page numbers are typed in the upper right hand corner of the page. Page numbers are extremely important in broadcast copy. Imagine an announcer on his way to an air shift, exactly on time who drops his copy and gets the pages mixed up. There won't be enough time to sort them out if they don't have page numbers.

The four-unit heading. This consists of a slugline, date, length of copy and type of release. The slugline serves as a little headline of the story. The date is the date the release was prepared. The copy length tells in seconds approximately how long it will take to read the story. There are two types of releases: the immediate release for hard news items and the like, and the general release for soft news, features, spots or any other material that doesn't have the immediacy of hard news.

EXAMPLE:

OUTDOOR RECREATION

APRIL 1, 19XX

(30 SECONDS)

FOR GENERAL RELEASE

In place of the type of release, you can have a DO NOT USE AFTER line with time and date. This is for timely material, usually about an event

that will run for a limited time. It gives the broadcaster a cut-off date or time to discontinue airing the release. You can also have a HOLD FOR RELEASE UNTIL line for advance releases. This is a good tool for providing material in advance, even though it shouldn't be aired until a certain time. It allows others to plan and schedule without putting the material out too soon.

Video-change spacing. In television copy, the rule is double spacing. When a video change is to occur in a television script, we then triple space. This alerts the announcer that there is a video change taking place. It may be returning from something else to the announcer on camera where more eye contact is required. The announcer shouldn't be seen looking off camera, and if for some reason he needs to look elsewhere, such as to a monitor for an on-cue point, the script will alert him as to when he won't be on camera.

On-cue. When reading to a videotape in a television script, announcers need a way to prevent coming out way ahead of the tape, or being too slow and thus behind the tape. The method used to do this is "ON-CUE." At selected points in the script, the writer builds in places for the announcer to pause, look at the studio monitor and wait for a particular point at which to restart. The number of times this is done in a script depends on the length of the script. The longer the script, the more times the announcer should pause. This is one way to provide for the varying speeds at which different announcers read.

The end or # # #. The number symbols, # # #, indicate the end of your broadcast release. Sometimes called "Dunphys," they should be centered under your manuscript column. You should have the word "more" in that same position at the end of each page to indicate that there is more copy on another page.

Editing Broadcast Copy

Absolutely clean copy -free of mistakes -is the rule for copy designed for outside release to television stations. Sloppy copy is a distraction to the broadcaster and it says something about you, your leadership and your unit that no one wants said. For in-house productions, edit marks may be used sparingly, but only those edit marks that are easily understood. DO NOT USE PRINT MEDIA COPY EDIT MARKS.

When inserting a period, comma, question mark, exclamation point, apostrophe, etc., just insert the mark where it should go. For other corrections, use one of the following broadcast editing methods:

are in the active voice and paint word pictures.

Features need logical development to be convincing. The lead sentence should grab the listener's attention. A sequential arrangement of facts brings the story to a logical conclusion.

At the end, a telling point illustrates the central idea or the informational objective of the story. Often, the telling point refers to the lead by restating the same idea.

Good features don't just happen...they're created through skillful writing.

Spot Announcements

Americans grow up with commercial messages and spot announcements. In contrast to features that may be used only once, commercials or spots are usually aired over and over again.

Department of Defense public affairs members do not write commercials. We write spots or spot announcements. Understandably, there is a similarity, since commercial messages are often called spots.

We think of the civilian media spot or commercial as something that sells a product. The spot announcement, as it applies to DOD public affairs, can do even more. It can "sell" the viewer on an organization, activity or attitude.

Types of spots. There are two forms of spot writing: SELLING and INFORMATIONAL.

The SELLING spot informs the viewer, then tells him to **do something**. The selling spot has three steps: ATTENTION, APPEAL, and ACTION.

The INFORMATIONAL or information spot simply **informs**. The information spot uses only the ATTENTION and APPEAL steps. It does not specifically tell the audience what to do (action, etc.). It simply informs.

None of the sentences in a selling spot should be over 17- words and the action step should not exceed six words.

ANNOUNCING

The announcing in TV news inserts is done by a reporter. Reporters are the heart of the news gathering system. Without them, there would be no news. In most cases, they go out, gather the facts, do the initial writing and editing and process it all into a news story.

While there are few differences between military and civilian broadcasts when it comes to television, one of the most obvious is in the appearance of the reporter in the news insert. In civilian television reporters are seen doing their work in the field or in the studio. The audience comes to know them and respect them. Most reporters gain a celebrity status. They usually have some title such as investigative reporter, or economics reporter, field reporter, general assignments reporter, and so on.

The military reporter, on the other hand, usually does all the reporting, and seldom appears in his work. We are not in the position for the purpose of marketing ourselves or becoming celebrities. A certain amount of recognition is unavoidable in the course of getting the job done, and it will even lend credibility to our product. You will find a level of cooperation present almost everywhere that few other military people experience. It's all right to smell the perfume as long as you don't drink any of it. Remember what you are there for, and that your most valuable asset is the ability to communicate information and ideas clearly for the purpose of command or public information. Use the recognition and cooperation to get the job done and create a better product.

In this lesson, we'll talk about what reporters do with ENG technology, and how they do it. Although technology doesn't do the work for the reporter, it does have a lot to do with it. Good solid reporting still begins with Who, What, When, Where, Why and How. Those elements, processed with accuracy, brevity and clarity, are still the necessary ingredients of good news reporting. Beyond that, the ability to find the right word or turn a phrase at just the right time to make the report interesting, informative and illuminating, will make the news report, as well as the reporter, stand out.

There are two basic types of news reports you will generally be dealing with. They are the spot news event and the news feature. The techniques you employ to cover these two types of stories will be similar, but with one important difference. That difference is in how much time you have to prepare for the story. The news feature can be planned well in advance, allowing the reporter time to think about and plan the coverage. An example of the news feature would be the flu shot program or the remodeling of a facility where it is news, but planned. The spot news event is

a breaking event, usually fast-moving and spontaneous. It seldom allows for any planning except in the most general sense. Examples of spot news would be fires, accidents, explosions, natural disasters, hijackings, shootings and other bad news events.

The only planning for spot news events would be in the form of some kind of disaster plan. The best way to begin to formulate a disaster plan is to say, "What if.." and then follow it with every contingency you can think of. Although you'll never be able to anticipate every possibility, you will be better prepared for many spot news events.

The Spot News Event

Coverage of a spot news event, a breaking story, presents a number of challenges. There will be two basic situations you'll be in when the story breaks. One will be when you're around your unit or station doing other things. The other will be when you're out covering something else. If it's the first, grab the equipment, find out as much about the situation as possible in a minute or two and get out to the site of the event. If it's the second situation, the timing usually means you'll have to either discontinue or rapidly conclude the story you're working on and move to the new location. Here is where planning of a general nature will come into effect. Will it be your habit to take double the batteries and tapes out on each shoot, or will you not have enough with you to do another story?

Experienced reporters will attest to the fact that this is where you'll have the most difficulty in ENG. The ability to change gears right in the middle of the story and go to something completely unrelated and start all over is perhaps one of the most difficult things to achieve. It can even be a bit dangerous in certain situations such as events where there is confusion and chaos. People get hurt in training accidents even when training is all they have to concern themselves with. Coming from an unrelated situation and different mind-set will add to any danger that is present.

Train for safety. Since television news field reporting can take you anywhere it is necessary to stress safety. Air crews are constantly reminded that safety is paramount. They are alert to dangerous situations and try to stay out of them. They follow preflight checks and flight rules scrupulously. You should pay as much attention to safety as the air crew.

ENG equipment is bulky, and you'll often have to take it into dangerous areas. Use common sense, sharpen your instincts, and protect yourself and the other members of your crew from danger. It would be silly to drive

so fast to a news event that you have an accident on the way. Likewise, around a construction site, you should stay clear of heavy equipment in operation. Stay well back from exposed electrical power lines. Don't lean far out of a tenth floor window to get that high-angle shot. Don't set up in the middle of a superhighway for that great into-frame-out-of-frame sequence. Don't set up your tripod on loose ground. When carrying the camera, be careful of where you step and always be aware of what is beside and behind you. Above all, don't become fixed in the viewfinder so much that you are unaware of danger around you. Since the viewfinder is a miniature television screen, don't get the feeling that since you're seeing the action on television, it's the same as sitting in your living room watching a war movie. **You're still in the thick of the action.**

Teamwork. The relationship of the reporter to the crew is critical. It must be a positive relationship if the team is to succeed. In a business where personalities and egos sometimes get swelled out of proportion, it is imperative that everyone be willing to accept the professionalism of others, particularly in military organizations where duty assignments require people to work in the same place without consideration of personalities. Personnel administration has enough in the way of limitations without adding problems like the inability of two large egos to work together professionally.

It may not be necessary for crew members to like each other personally, but they must get along well professionally, and not allow personal differences to get in the way of the mission. Perhaps the most important element to being able to work together is to communicate. If everyone is willing to talk out differences with an open mind, you will come to an understanding, sooner or later. Be polite to your fellow team members, and mean it. Develop the habit of using the words "please" and "thank you." A little courtesy goes a long way, both with your fellow workers and with the public.

Everyone should have a mutual respect for the equipment, and the problems the other crew members have in operating it. You can't detach yourself from the need to protect it and take proper care of it.

Reporting the spot news event. There are five general reporting problems that we must deal with in the spot news event.

- o Time constraints and deadlines
- o Fact gathering
- o Sources
- o Building the story
- o Clarity

Time constraints and deadlines. There are few assumptions that are acceptable, especially when you deal in facts. One of them, however, is assuming that you won't have enough time to get everything you need for your story. Don't hurry to the point of doing substandard work, but if you keep in the back of your mind the fact that you'll seldom have enough time, you'll be less likely to waste it. You may have deadlines or time pressures of another kind placed on you. Maybe the event occurs mid-afternoon and you need to get your report covered and filed before the evening news. Timing is everything. If it isn't on the news tonight, it'll be in the newspapers before the news tomorrow night and that will take all the immediacy out of your report.

As you race around to find out what you can, stick to the basic elements. You'll have a better chance of getting what you need than if you run around without any organization. Remember Sergeant Friday of Dragnet..."Just the facts, Ma'am!"

Fact gathering. You must capture the basic framework, the Who, What, When, Where, How and Why of the story as quickly as possible. These are always the basics you need in any story. The How and Why are not always as easy to obtain as the others, but they are also the two that you can find out more about later. Beware, however; they are also the two where people are most likely to speculate.

Sources. Be sure of your source. Very often when you are at an event, people will want to get on television and they will want to be interviewed. That will make it difficult for you to sift out what is factual and what is not. Here's a list of things for you to think about.

- o Who is in charge?
- o Who is the official source?
- o Who or where is the information coming from?
- o Is there anyone here whom I know is the authority?
- o Is there more than one side to this?
- o If so, who is the spokesman for each side?
- o Is what I hear the same as what I see?
- o Do I see something others don't?
- o Can, or should, I do something about that?
- o Does anyone here have a personal interest in this?
- o What can, or should, I do about that?
- o Is there more than meets the eye?
- o Will this event affect other important things?

When asking yourself these questions, you may not be able to come up with answers to all of them. The information you get will determine how many questions you'll be able to answer correctly. Some people may give you opinions based on limited knowledge they have at the moment. Some may try to give their versions for personal reasons. And remember, everyone isn't

a journalist, and some people speculate. The more you cover the better you'll get at sensing what are facts. The more you know about the military, the more you'll be able to distinguish truth from fiction in military events. You will have to rely on common sense, experience and gut feelings. Ask yourself: Does this make sense? Is it logical? Does it come from more than one source? Did you check with more than one source? Is this the best source? Does the source know first hand or second hand, or even less directly? If your source uses phrases like "I was told," or "I heard," perhaps you should seek out another primary source. Is it official, unofficial or rumor? We never report rumors, but we do check them out.

Building the story. You'll find the most precious commodity at a spot news event to be the time necessary to think things out. There will seldom be enough time, but you must take enough time to formulate your story properly. Determine the approach you are going to take with the story. Stay with the basics. Develop a sense for what is important and what is significant. It's up to you to build for your audience a clear, concise picture of the main elements of the event. Keep it straightforward and simple. Take it a step at a time. Develop and finish one element before going on to the next. Don't jump back and forth between important elements in the story. Keep the story organized and moving forward. Make your story a tight report of known facts and keep it in logical sequence.

After you have done a good job of building the story and giving your audience all the important facts in logical order, be sure to have a good solid ending. How you end the story can be the finishing touch, or the one effort that destroys all your other efforts. You may want to re-cap or summarize the facts you've reported. But be brief. Don't get carried away with your eloquence.

Clarity. There will be later chapters on writing and scripting, but it is logical to point out here that all the rules of simple, tight, easy-to-understand writing that apply to the writing of a script, also apply to anything you may conjure up or ad-lib on the spot. It's almost impossible to maintain proper wording and grammar if you start using a lot of compound and complex sentences. You wouldn't do it in the writing of a script. You shouldn't do it in what you put together in the field on a spot news report. Always try to:

- o Use declarative sentences.
- o Keep verbs in the same tense throughout the story.
- o Keep pronoun references clear.

When using big colorful words, you take a chance on conveying an incorrect meaning or creating a false impression. Sometimes the more simple

language is called for. It's better to speak below some of your audience and be understood by all than to speak above any of your audience and not be understood by some. Beware of speaking down to anyone though. Strive for that balance where your audience understands you and can relate to what you say.

The News Feature

Unlike the spot news event, the hard news feature will probably allow you at least a little time to research the subject, to plan the coverage possibilities, and set up some aspect of the coverage in advance. On-camera interviews with people who make the news can be scheduled. You can outline the story and a tentative structure can be applied to it.

Proper research takes hard work. You'll get a jump on any story with library files and scripts on file of all of your past stories. If you have any sort of beat system, you should have file footage and facts concerning your beat. These may include newspaper and magazine article clippings, other background information, any notes you've made, lists of phone numbers and in short, anything regarding anyone or anything you may be called upon to cover. Of course, you'll have to have some sort of filing system that will allow you to lay your hands quickly on needed information.

Even if you're not a fountain of information on a given subject, you may have sources that can enlighten you about your topic. By contacting knowledgeable sources, you might quickly improve your chances of getting the right information, or at least bringing up to date what you have.

If you don't even have enough information to know what to find out, that in itself is a good question. "If you were me, what would you ask?" If research is important --and it is --what you do with the information is even more important. Use what you learn as a foundation. Think things through and try to imagine and question every possible aspect of the situation. Who is involved? What do you want to ask them? What is the mood of the story? What are some of the visual possibilities and opportunities? What about natural sound? What might be particularly difficult, dangerous, sensitive, or hard to understand? How can you really bring the story to life for your audience? When you get answers, think of what further questions they bring about. There is no substitute for research. The better you are informed, the more completely you can tell the story.

Those are just some of the questions you can ask about almost any situation or story. As you go through the mental exercise, other questions will come up. That's one of the advantages of the procedure. All the while, you'll be getting valuable insights and perspectives on the story, and that's the first step in producing a precise report that will make sense to your viewers.

When do you spend time on research? In spot news event coverage, the event is happening now and if you were to take time to research something, the event would be over and you would not have covered it. That's why you have contingency plans. In the news feature, there is more often time to spend on research. You may think that time is too precious to waste, but the truth is, you can't afford not to spend the time. It's the price of excellence and success. Having done your research, you begin to gather the facts in the field. Start looking for information that will help you answer the final questions you should be asking yourself. The most important questions are:

- o What do we really have here?
- o What is this story about?
- o What does this story mean?
- o What do we want to convey to the viewer?

These are simple questions. Try to come up with equally simple answers. Be aware that sometimes the most obvious answer may not be correct. Take a good look at your answers and try to find fault with them. Play the devil's advocate to yourself.

All this may be a lot of mental exercise, but it's worth it. You'll find that the rest of the job will be much easier. Now you're coming to the most interesting part of the job, putting together your field report and organizing all your facts into a story. Remember, a story has a beginning, a middle, and an end.

Opening Segment. As we said, your story must have a beginning, a middle and an end. Which is the most important part? Even the experts disagree. Everyone will agree, however, that all three parts are important. The best way to treat that question would be to feel that they are all too important to give any less than maximum effort. They are three distinct segments and each of them is important in its own way. It makes good sense to give each of them special attention.

The intent of the open or lead is to attract the viewers' attention. You must grab their interest and point them in the direction the story will take.

There are two types of leads: hard and soft. A soft lead is rather non-specific and generalized. It sort of flows into the story. A hard lead, on the other hand, is much more specific and direct. It zeros in on the most newsworthy element of the story.

Either way, the lead must stimulate the viewers to pay attention to the story. But it's not just a matter of getting their attention, it must be done in such a way as to be consistent with the rest of the story. Changing gears right after the lead will only serve to disorient or disappoint your audience when what you really want to do is focus their attention on your message.

Including An Actuality. If you are going to include an actuality in your report, be very careful in the wording of your questions. Remember, you have one goal, to get the word "straight from the horse's mouth," so to speak. You will use either the newsmaker or an eyewitness of the event. Either way, the interviewee will most likely be unaccustomed to being on camera or at least unfamiliar with what you need most from him. There are two hazards to avoid: the yes-or-no answer which is, of course, too short and the non-stop talker whose answer takes too long. Most people will fall into one of these categories if not handled correctly. It's the question and how it's asked that will assure your success or failure in avoiding these pitfalls.

Your interviewee will most likely lack announcing skills as well. He won't know how to talk to only one person when addressing a camera. Be the one person for him to talk to. Listen to his answers and look at him when he is answering your questions. Looking around or checking your notes while he is talking is both rude and distracting. He will probably think that you have tuned him out, and may even stop talking in the middle of his answer. You will also stand a much better chance of coming up with that obvious follow-up question that will clarify his answer.

Control of time. Since you're taping your actuality, re-ask a question if the answer is too long-winded. Reword your question so that the answer will be more along the lines you're looking for. But avoid things like, "In other words, you mean" This is bad for two reasons. You're putting words in the interviewee's mouth which may or may not be what he wants to say, and you might get a simple, "Yes." Another time-control measure is to keep your questions short and to the point. Let the interviewee tell the story. After all, that's the purpose of doing an interview in the first place. Interviewees can sometimes get off track or provide more detail than you need. Here's where you must take control. Although interrupting is normally rude, it may be necessary. There are acceptable ways to do it. Be gentle. A "Pardon me," or "Excuse me," never

hurts, but they can go along with a "Let's emphasize that point," or "Can we go back over that?" to let the subject in on what you're doing. Most people will understand if you handle it properly. You might be surprised at how your subject will respond to a well-coined phrase like "In the remaining few seconds," or "We have time for just a brief word." If they have ever watched television, chances are they've seen this done before.

Get in the habit of leaving a brief pause between questions and answers. It needn't be anything long, but you'll find that a little space will come in handy during editing. You will always be able to edit out any dead air.

Reverse questions. These are also called reporter cutaways. You will want to ask the questions again with the camera on you. The subject will understand with just a brief explanation. Be sure to do it in the presence of the interviewee and in the same spot for continuity in editing. Normally you won't use the questions in your finished piece, but be very careful to ask the questions with exactly the same wording so if you do need to use all or part of the footage, you'll be able to edit anywhere you want. This reverse angle footage can be useful in a number of ways. One would be to cut an answer short by switching to the video of you, with a slight pause beforehand, going into the next question.

You'll want some reverse angle video of your reactions to the subject's answers. Then if the subject looks off camera, or something else of a visual nature is distracting, you can just edit it out, without interrupting the audio that you want to keep.

Get to the point. If the opening segment grabs the viewer's attention and the close wraps it all up, then the middle is where you do the real telling of the story. Stick to the point. Remember? What does this story really mean? Don't be afraid to explore side issues, especially if they add to or shed light on the real story, but make sure you don't ramble around on a lot of issues that don't belong in the story. Don't forget the five W's and the H.

Concluding The Story. The closing of your story is at least as important as the opening. After an opening aimed squarely at the mark and a body that brings all out the facts and gives a clear, concise picture of the event, you need to tie it all together in a manner that will make sure the viewer gets all the information. Be sure that your close comes from the facts already in the story. A summary or recapitulation of the three or four main points of the story will ensure the viewer understands what has been presented.

Above all, remember that reporters are reporters and not editorial writers. Just as you would not insert conclusions that are not supported by fact, neither should you insert your own personal opinions, judgments or characterizations. Good field reporting requires all of the reporter's ability to tell the story in a clear, concise, logical manner. The hard news feature requires careful planning, organization and intense focus on the story's main point. The spot news event by its nature doesn't allow the specific event planning of the feature, but planning in the generic sense should still be there. And, of course, tight organization and intense focus are still a requirement. Because time will not allow you to tell everything there is to know about a story or event, it's up to you to decide the main point of the story and convey it to your audience.

INTERVIEWING

This is where it's extremely difficult to do the whole job by yourself. Interviewing in the field is best done by two. One, the reporter, and two, someone to shoot the video. It can be done by one person, but if at all possible, there should be at least two members in the crew. This lesson is going to address the two parts of an interview; from the standpoint of the reporter, and the shooting of the interview by the camera operator.

Interviewing is the part of ENG that camera operators find the most boring. There are already too many "talking heads" on television news programs, but when they have something interesting and significant to say, they are an important part of the daily news. Use them to tell the story, when they are the authority or when they are closer than you to the story. Just be sure that what they have to say is pertinent or important.

Camera location in relation to the subject is very important and there are several commonly used shots and angles. The most common angle used is over the shoulder of the reporter. (See Fig. 3-1 Interview Camera Angles). From this angle, you can affect three widely acceptable camera shots. With a wide field of view (the long shot), the reporter and subject are shown together.

FIGURE 3-1. INTERVIEW CAMERA ANGLES

This shot shows the viewers that what they are looking at is an interview. A medium shot will still have a portion of the reporter in the picture while allowing the audience to get a closer view of the subject. It will still give the viewer a sense of the closeness of the subject to the reporter. And of course, the tight shot doesn't show the reporter at all and gives the viewer a close up view of the subject.

During an interview, the person being interviewed will usually be tense and nervous. After all, he is for the most part, doing something completely foreign to him. This can be overcome by an experienced reporter, and indeed, it's his job. Let the interviewee know that he is to give his answers directly to you, to look at YOU when he answers YOU. It's important that you look back at him when he is talking to you. This will make it more like a natural conversation to him. Put him at ease. He will be depending on you as a security blanket and confidant.

The over-the-shoulder angle establishes a line of action. Whichever shoulder you shoot over, all shots should be on that side of the reporter and subject (Remember the 180 rule?). And of course, remember all the little tidbits of information you learned about plants growing out of people's heads and so forth. You can make the background fit the interview. You can separate the background with light and darkness. You can lose the background with depth of field.

Another thing you should know when it comes to the interview is the four-point lighting system, even though most portable lighting kits have only 3 instruments (See Fig. 4-2, Four-Point Lighting System).

FIGURE 3-2. FOUR-POINT LIGHTING SYSTEM

In the four-point lighting system, the key light for one subject is behind the other subject and works as a back light when the beam is spread just a bit. With the addition of the fill light on the same side, you then have a combination of the three-point lighting system and the modified three-point lighting system. The key and fill lights for one subject work the same as the two back lights of the modified three-point system for the other subject. And of course the other subject has a key light and a fill light in addition to the two back lights.

EDITING

After all the functions you've performed in announcing, writing, scripting and interviewing, you have still more. It's like all the parts of an automobile. They've been manufactured, but they're still just parts. They must be assembled to make a car. The same holds true for your TV news insert. You now have all the parts, but you must assemble them. That job is called editing, and just as in the assembly of the car, you still have important work yet to do. Depending on local SOP, there will probably be additional elements to add to what you've already shot in the field, such as color bars, countdown leader, start flash, etc. While you edit the PRIMARY and SECONDARY footage you shot in the field to your slave tape, you'll keep a close eye on audio and video levels. Keep the quality level of performance high as you perform these routine and sometimes boring

tasks. Make sure all your edits are clean and avoid jump cuts. (Lesson Four, Subcourse DI0350,)

A few years ago, the Ford Motor Company informed the public in its commercials of how to spot poor automobile assembly, what to look for in the showroom. The gaps at places where parts joined. What a seam between door and fender should look like. Evidently they felt that they did a better job than their competition in putting together equally good parts. Proper assembly is important. It's so important, that this subcourse devotes an entire lesson to it even though there was an introductory lesson to it in Subcourse DI0350. Therefore, we're just going to emphasize the importance of it here, and refer you to Lesson Four. Go forth and learn more about videotape editing.

PREPARE/PERFORM TV NEWS INSERTS

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. TV news inserts make up a very small portion of the electronic journalism business.
- T F 2. The basics of any news story are the who, what, when, where, why and how.
- T F 3. How you word your questions will have a lot to do with how an interviewee will perform.
- T F 4. The news feature is fast breaking and allows no time for planning.
- T F 5. The six C's of broadcast writing are: clear, concise, courteous, complete, current and correct.
- T F 6. Material in parentheses is information not normally meant to be read aloud.
- T F 7. The spot news event and the news feature are the two types of news reports.
- T F 8. Department of Defense spots may only be aired once.
- T F 9. You should include as many facts in the opening of a story as you can.
- T F 10. You should triple space lines at places in the copy where video changes occur.
- T F 11. You should never interrupt an interviewee in the middle of an answer.
- T F 12. The lead of a story should grab the audience's attention.

LESSON FOUR

EDIT VIDEOTAPE

46R Soldier's Manual Task: 214-177-1318

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of editing video-tape.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly edit videotape.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual &
Trainer's Guide, Broadcast Journalist,
MOS 46R Skill Levels 1/2/3/4, August 1988.
Defense Information School Radio and
Television Handbook, May 1982.

EDIT VIDEOTAPE

INTRODUCTION

The most useful or important thing about videotape is the fact that you can edit it. Editing can range from simple cut-only edits to electronic edits that go through switchers and effects banks to create dazzling special effects. The kind of system available to you will determine the degree of complexity and level of accuracy in your editing. All 3/4 inch video cassettes require an inserted red pin to permit editing on them. Whenever your system won't edit, check that first.

MECHANICAL EDITING

In the early days of videotape recording, the only way to edit videotape was to physically cut the tape and splice it back together the way film is edited today. This is extremely difficult because unlike film, which is a physical or chemical process from start to finish, videotape is all electronic. You can't actually see where a picture starts or stops on the tape, and you can't just cut it anywhere like you can audiotape. It has to be spliced between invisible electronic video frames to prevent the picture from tearing and breaking up during playback. There is a special fluid you can apply to the control track to make the electronic pulses visible in order to splice between them, but they are visible only under a microscope. To make matters worse, there is a separation between the video heads and the audio heads making the audio at a different place on the tape than the video. Also, the video is diagonal due to the helical scan process. The complicated process of cutting and splicing videotape is all but a forgotten art, and is now used only in cases of extreme emergency. Today, videotape editing is done electronically.

MANUALLY CONTROLLED ELECTRONIC EDITING

The problems you face with mechanical editing, trying to locate the exact edit point and trying to cut precisely, are no longer problems with electronic editing. Electronic editing is a transfer process where a playback machine transfers the recorded segments of program material to an edit/record machine. In other words, it's simply a dubbing process where the recording machine copies the material from the playback machine. With most videocassette editing systems, there are playback machines, record machines, TV monitors and edit controls (See Fig. 4-1 Videotape Editing System). The edit controls allow you to find accurate beginning and ending --"in and out" --points for your edits. The TV monitors allow you to

view the video being played back and the video being recorded. The editing controls shuttle the tape back and forth, allowing you to do the actual edits.

FIGURE 4-1. VIDEOTAPE EDITING SYSTEM

It is already obvious that videotape editing differs from audiotape editing. So far we have spoken of one manner only. The second way it differs is due to the fact that videotape takes a second or two to get to the proper speed and stabilize. That means that the tape must be traveling the correct speed with all the electronics stable when the edits are made. This can be a little tricky in the manually controlled electronic editing process. It's called "editing on the fly."

The process is usually done in six steps. They are as follows:

1. Determine the "in" point on the record/edit machine. It would be a good idea to play the scene over a few times to be able to hit the exact same point with regularity. This will be the point where you want the next scene to begin.
2. Find the "in" point on the playback machine. That's the point where the new material begins, the material you want to transfer to the tape you're creating.

3. Rewind both machines exactly the same number of seconds and frames. This is called the preroll, and it is used to give both machines enough time to get up to speed and stabilize before the edit is actually made. In manually controlled editing, it should be about ten seconds. Just make sure that both machines are rewound EXACTLY the same amount.

4. Next, start both machines in the play mode at the same instant and watch the record/edit machine monitor. When it gets to the precise point where you want the edit to begin, push the record button. This will change the machine from playback to record while everything is rolling at the proper speed and all the electronic circuitry is stabilized. You are now making the edit.

5. Let the edit (both machines) run past the point where you want the next edit to begin and then stop them. This is called a video pad. The purpose of the pad is to allow you the room to begin the next edit without having to be so precise on the in point.

6. Then, of course, recue the record/edit machine and check your edit. Make sure it's clean, without video break-up. If there are more edits to be made, start over with step 1.

It should be evident now that precision and accuracy are of utmost importance in this editing process. If either tape machine is the slightest bit off, the edit will be too early or too late. Too early means that you have recorded over something you wanted in the previous scene, and too late means you have gone beyond the desired point to begin the edit.

Assemble Edits

All electronic editors permit you to edit in two modes. They are "assemble" and "insert." There are a number of facts about assemble editing that are not true about insert editing. They are:

1. The assemble mode edits everything on the tape to include the control track (See Fig. 4-2, Assemble and Insert Editing).

2. There is no preconditioning of the record/edit tape necessary.

3. Since the control track is laid with each edit, there is the possibility of a variance in the spacing of electronic pulses that will cause a tearing of the picture at that point (See Fig. 4-2 Assemble and Insert Editing).

4. Following each edit, there will be a loss of control track causing a "dirty edit." This makes it absolutely necessary to leave a video pad at the end of the edited segment.

FIGURE 4-2. ASSEMBLE AND INSERT EDITING

Insert Edits

The initial purpose of insert edits was to allow the addition of audio and video to programs that already existed. Everyday you see examples of such additions. The movies have done it since their beginning. For example, you may see someone looking into a box, then see what they see inside the box, then see them again for their reaction. Of course, the shot showing you what is in the box was shot separately from the other, and edited in later. To do this in videotape with the electronic editor, you need to select the in and out points in the insert mode. You must program the out point because otherwise the tape would continue to edit beyond where you want it to stop.

Insert editing uses control track that already exists and allows you to edit the video track, the audio one track, the audio two track or any combination of the three. Since no new electronic pulses are being laid on the tape, there isn't any danger of variance in spacing of the pulses that could cause tearing of the picture. It is a much more stable edit and most experienced editors prefer this method. The disadvantage though, is that you must first lay control track for the length of tape you intend

to use. A one-hour tape, for example, will require you to record an hour of control track. This is called crystal black and you must record it from another tape, studio output or a black burst generator. Of course, to record control track on your tape, you will have to be in the assemble mode. Your editing will then be done normally, but in the insert mode.

* * * * OPERATOR WARNING * * * *

After laying the control track in the assemble mode, be sure to change the edit control unit to insert mode. Once you begin to make your first video or audio edit, if you haven't changed out of the assemble mode, the end of the edit will be dirty and there is no way to correct it without re-laying the control track for the entire length of the tape.

Of course, if you think ahead, you'll have a supply of prerecorded crystal black tapes on hand so that emergency editing jobs or fast-breaking stories can be insert edited on a moment's notice.

PROGRAMMED ELECTRONIC EDITING

There are several edit programmers or edit control devices available for both quadraplex and helical machines. They allow you to predetermine the exact points where you want the edits to begin and end.

Although the edit programmers differ slightly, the basic process works like this:

- o Find the in point on the record/edit machine by just cueing the tape to the exact spot where you want the edit to begin. There will be some sort of "edit in" button for you to set the point into the machine's memory. Do the same for the "edit-out" point.
- o Do the same thing on the playback machine to locate and cue the point where you want the new edit material to begin.
- o Most program edit systems will automatically preroll both machines. You can accomplish this now by setting some "automatic edit" function.

- o At this point, you may preview the proposed edit without actually accomplishing it. The record/edit machine will not actually make the edit on the tape, but will display it on the monitor without altering the edit in and edit out points. If there is something about the edit you wish to change, you can do it at this time. If not, you can simply execute the edit by either pressing the "auto edit" or "recue" and then "auto edit."
- o The "auto edit" may be called different things in different systems. It will most likely be "auto edit" or "edit record" or something that means the same. Whatever it's called in your system, it will start both machines simultaneously, lock them into synchronization, and make the edit precisely at the preprogrammed edit points.
- o Subsequent edits will be accomplished by repeating the process. Of course, you will want to review the entire tape after you have edited it to see if all the edits are clean.

EDIT VIDEOTAPE

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The process of cutting and splicing videotape is the perfected new method of videotape editing.
- T F 2. Videotape takes a few seconds to get up to speed and stabilize.
- T F 3. Assemble edits edit everything on the tape.
- T F 4. Insert edits edit everything on the tape.
- T F 5. Many programmed electronic editing systems allow you to preview an edit before actually making it.
- T F 6. Insert edits always leave a dirty edit following the edit out point.
- T F 7. Preroll for manually controlled electronic editing is usually five seconds.
- T F 8. Electronic editing is merely a dubbing process.

LESSON FIVE

PERFORM AS ENG TEAM CHIEF

46R Soldier's Manual Task: 214-177-2301

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of performing as an ENG team chief.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly perform as an ENG team chief.

CONDITION: You are given the material presented in this lesson.

STANDARDS: Perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual &
Trainer's Guide, Broadcast Journalist,
MOS 46R Skill Levels 1/2/3/4, August 1988.
Defense Information School Radio and
Television Handbook, May 1982.

PERFORM AS ENG TEAM CHIEF

INTRODUCTION

The responsibilities of an ENG team chief can be stated very simply.... everything that has anything at all to do with the gathering of news electronically, is in one way or another, the responsibility of the ENG team chief. In some cases, there will be only one person to accomplish everything. In other cases, the ENG team chief will have little to do other than supervise and be responsible. In all cases, the ENG team chief is responsible for the final product: its technical quality, its thoroughness, its aesthetic quality and its ethics. A good ENG team chief must be prepared to supervise or accomplish all ENG tasks in all situations.

SELECTING EQUIPMENT AND PERSONNEL

For the most part, there is little difference in civilian and military electronic news gathering. One difference that will become most obvious to you in the everyday performance of ENG team chief functions will be in equipment selection. In a civilian station, the news department has a lot to say about the equipment purchased by the station. In the military, however, your equipment has been selected by the proponent, within guidelines-established by the military procurement system. The equipment selection was made with an eye toward your mission and you should already have everything you'll need to do the job. You might say that the equipment has already been selected for you, leaving you only the choice of how much of the equipment you'll need to take to the site.

A big part of your responsibility as team chief will be to be sure that all the equipment is on hand, serviceable, packed and ready to go. Batteries need to be charged and you'll need a sufficient number of tapes with red pins. You must have the proper lighting equipment with electrical cords, stands, barn doors, spare bulbs, insulated gloves, screens and reflectors. The camera, recorder, tripod and connector cables will have to be ready. Don't forget microphones and cables. In short, you'll need to know what equipment will be needed for the project and take the needed steps to get it on location.

The ENG team chief must also select the team members for each production from those persons available. Other duties, leaves, passes, temporary duty assignments, illnesses and personal abilities or limitations are all factors you must consider.

Your most valuable asset will be checklists. Experience will make things routine, but you should never rely strictly on your memory. There is a lot to think about in the business of ENG and your mind will always be occupied with many other things. A checklist for the equipment required for each type of production you'll be called upon to do, will be not only a timesaver, but the insurance that will prevent a disaster sooner or later.

CONDUCTING SITE SURVEYS

A very small portion of what you do will be spot news stories. A large part will be coverage of planned events. That will allow you to conduct site surveys. Before you can produce successfully at a remote location, you must conduct a site survey.

There are many things you'll need to know about the ENG location, and the time to find them out is in the planning stage. Where should the camera be positioned? How much light is available? Where can we park? How far must we carry the equipment from the vehicle? Will there be enough electrical power for the lights and other equipment? Will there be outside noise to worry about? What about problems with mixing of color temperature of light? (More about this in "Determining Lighting Requirements"). You'll need the answers to these and more questions.

Site surveys have three main purposes. They are: to determine the location for the production, to determine where all the production equipment and personnel will be positioned, and to determine if all the production's needs and requirements can be handled at the site. Very often, the first question, "Where is a suitable location?" is answered by the event itself. A change of command ceremony, for example, will take place on the parade field or in the theater in case of inclement weather, and you won't have much to say about the location. On the other hand, something like a training exercise will give you some options as to what particular segment you'll cover and therefore, some option as to location.

If you're covering something outdoors, make your site survey at the same time of day you intend to cover the event. That way, the daylight will probably be the same, if the weather is anywhere near the same. At least, you'll be able to position the camera or cameras with the back to the sun. It would do little good to conduct a site survey at 8 o'clock in the morning with the sun in the east if the event is going to take place at 4 in the afternoon when the sun will be in the west. When you know exactly where the sun will be, you'll see the length and position of shadows, contrast between light and dark areas and anything else time related.

Although it may seem that indoor events would not make any difference as to what time of day you need to conduct the survey, it's not always the case. Traffic patterns might be different and affect your ability to get somewhere in a certain length of time, or the availability of parking might change, or even a change in the pedestrian traffic at the location could give you problems. There could even be a large difference in the drain on electrical power from one time of day to another.

Finally, take nothing for granted. Do the electrical outlets you intend to use actually work? Does that window you want to run a cable through really open? Is that elevator or escalator going to be working when you will need it, or will it be turned off? It's certainly better to oversurvey the site than to miss one important point that will lead to a disaster later.

While every remote production site will differ at least slightly, there are still some common points that must be considered by the ENG team chief.

Local Contacts and Clearances

You should always have a local contact who can provide access, information, and help with various details. It might be someone connected with the site, or someone connected with the event. If it's someone connected with the event, you may have to have another contact who is connected with the site or facility. Get their names and phone numbers, and those of any assistants who might also be helpful. When possible, you may also want to establish contact with electricians, plumbers and maintenance people.

Access. Establish where you'll need access to the site, when you'll arrive, how you'll get your equipment from your vehicle to the working area, and what help, if any, you'll need. If you're going to be arriving at odd hours, make sure someone will be on hand to grant you access.

Permits. If your event is in the civilian world, remember they require permits for everything. You may need a police permit to park vehicles on the street. You may need special permission to block traffic. You may need some help with crowd control so you have an unobstructed view of the event. Of course, you will want to prevent any danger to your equipment from a crowd. Whatever you need in the way of permits should be obtained well in advance of the scheduled event.

Permission. There are many places where you'll need special permission to gain access. There may be security precautions. Maybe you'll be covering something that takes place in a camera restricted area. You'll need, not only an escort, but something in writing to show that you have the permission to enter and videotape in the area. In the military, a memorandum for record will usually suffice. If you're going to be escorted by the public affairs officer or his representative, it might not be a bad idea to be sure they have the permission they need to get you in. Of course, that is something that must be handled tactfully. No one likes to have you hint that he might not know what he's doing. Usually a question like, "Does this building require any special permission to bring a camera in?" will do the trick.

Parking. You'll need to arrange for parking for your vehicle as well as any privately owned cars of your crew. Sometimes you won't have much say in the matter, but try whenever possible to have your production vehicle as close to the shoot site as you can. You never know how many trips you'll have to make back and forth, or how urgent one of them might be. Don't forget that you need to have unrestricted movement back and forth to your vehicle as well.

Cameras

Positioning of the camera(s) is an extremely important decision that you must make during the site survey. Will you be required to move a camera at some point during the event? Be aware of reflecting surfaces and the possibility of the camera capturing its own reflection. If there is more than one camera, keep them out of each other's shots, unless that's the effect you're looking for. Don't forget screen direction and the 180 rule.

Try to anticipate things that could happen during the event to affect your camera shots, such as an audience rising to its feet and blocking the camera's view. Think about people moving around and make sure tripod legs are not going to get kicked or tripped over.

Audio

Even in the studio, under very controlled conditions, the production of high-quality audio is difficult. When you throw in all the acoustical problems and unplanned noise you experience at a remote location, the problems magnify.

Some of the basic things you'll need to know at site survey time are:

- o What sound sources (including people) must have microphone?
- o Will the microphones appear in camera shots? Is that acceptable?
- o What potential audio problems are there? (external noises like air conditioners running, etc.)
- o Are there any special arrangements to be made such as pool audio or tying into a public address system?

With the answers to these questions, you'll be able to decide what microphones you'll use to get the high-quality audio you want and need. All your decisions will be made while considering the equipment available. You'll consider the pickup patterns available. Sometimes you may even have to compromise somewhat because of limited availability of equipment. Experience will help you avoid, or at least minimize such compromises, but site surveying will help you keep the quality of the audio within acceptable standards.

Talent. Announcers, play-by-play sportscasters and commentators can usually get by with lavalier or hand-held microphones. If you have a headset microphone, it will allow hands-free operation and maintain a constant announcer-to-microphone distance. You must consider any movement flexibility required. Maybe, you'll want to use a wireless microphone. Will there be any external interference? Of course, if you use normal cables, they should be run around any high-traffic areas and away from power lines.

Natural sound. The natural sounds are necessary to make any event real and believable. You'll rely heavily on the camera microphone, but sometimes you may even have to place a microphone for optimum reception of natural sounds. Consider the pick-up patterns you'll need. Crowds, for example, will best be captured with an omnidirectional pattern. Your camera microphone is a shotgun or supercardioid pick-up pattern.

Power

Calculate the production's total power requirements, and be sure the power you need is available. Besides noting the voltage and amperage, make sure the wiring configuration is compatible with your equipment.

You have batteries for your equipment and usually that's the simplest way to go, but remember, batteries limit the amount of operating time. Also, after you have used up your batteries, you can't use them again until after recharging.

What if some fast breaking news story requires you on the way back to the station? If you just used all your batteries, you can do nothing about it. Always use available AC power at the site when you can. Save your batteries for the emergency that will always pop up when you least expect it.

Check all outlets in advance. Never assume that they work. Know where the breaker box is located. Try to spread your power requirements out as much as possible to avoid blowing a fuse or throwing a breaker in the first place.

Cables. Plan the power cable runs to cameras, recorders, lighting instruments and any other production equipment. Don't use extension cords intended for home use. They are too thin a gauge wire for your requirements. Make sure your cables are the heavy-duty, insulated electrical cable for professional use that provide the durability, safety and power load for a remote situation. Plan not only on the number you'll need, but the length as well. When planning the power cable runs, remember that they should not be run where they can interfere with audio cable signals. Don't forget to keep them out of the camera shots.

Communications

There are two types of communications you must consider when surveying the site. Are there telephones available to call back to the station if necessary? What kind of communicating are you going to have to do during the event between crew members? Will you need PLs? Can you do what communicating you need by sign language? Never leave yourself unable to communicate or restricted in your ability to communicate with your crew or your on-site contacts, if you can possibly avoid it.

Security

Will you require any special security arrangements? How about for your equipment? Be sure your equipment is secured against both theft and damage. People have no concept of the cost of television equipment. They can't imagine a camera costing more than an automobile and their treatment of them reflects it.

The remote location site may have security that will require you to have credentials and passes. During the site survey is a perfect time to arrange for them. You'll have to specify how many people you'll need passes for, to include staff, technical crew and talent.

Food and Lodging

Your local contact will be a great help in providing food and lodging for your crew, but it's up to you to make sure that it's taken care of. Your job, no matter what rank, is that of a first sergeant, taking care of the troops. It's a good idea to keep everyone together for meals that are during the production, such as breaking for lunch. Then you won't have to wonder if everyone is going to make it back for the afternoon session. When covering something like a field exercise, you'll probably eat with the troops anyway and your crew will then be in close contact with you for the entire break.

Even if you don't have to provide a full meal, some sort of coffee and doughnuts (in cold weather) or cold drink and a snack (in hot weather) will be greatly appreciated. The lift in morale will be well worth the effort on your part. Of course, if you need to be on location overnight, it's up to you to arrange billeting for the crew.

Transportation

You are responsible for transportation, not only to the site, but to and from the lodging for the duration of the production. That can be something very simple, or a major logistical operation.

Construction

Will there be any special construction required? Scaffolds to serve as camera platforms, or lighting or announcer platforms? If so, find out during the site survey and have everything done prior to the event.

Graphics

If the production is going to require any graphics or character generation, you should plan it at this time. Knowing ahead of time will allow you to make available to yourself the graphical equipment you'll need. After the on-site production, you may not have time to get the graphics together and shot in time to meet your deadline. At the time of the site survey, you will probably be able to anticipate all of your graphic needs.

PRODUCTION MEETING

Once the site survey has been conducted, the final preparation point is to have a production meeting. Even if there are only two people who are going to accomplish all the tasks, it is necessary for those two to meet

and discuss all facets of the production. Be sure that everyone knows what his job is and that all jobs are covered by someone.

You have tried to think of everything that needs to be addressed. You've asked yourself questions about everything that is likely to happen. Now ask questions concerning some things that are even unlikely. Make some contingency plans. Just like defensive driving, expect the unexpected. If you have already asked yourself what you would do if a certain thing were to occur, and answered the question, you will be well prepared to handle the situation if it does occur. Of course, if on the other hand, you haven't even thought about that same possibility, the chances are pretty good that it will cause you a lot of problems.

DETERMINING LIGHTING REQUIREMENTS

Outdoors

During the daytime, there will usually be enough light outdoors to satisfy the technical requirements of the camera. That doesn't mean that you will have nothing to do about the lighting. There are a lot of different circumstances that can require additional lighting outdoors. It's your concern, as ENG team chief, to ensure, not only sufficient lighting, but proper lighting for the production. Just because you're going to be shooting outdoors, don't neglect to carry with you and plan the use of lighting instruments, sun guns, reflectors, stands, cables, screens, scrims, barn doors, spare bulbs, fuses and any other piece of equipment necessary. Remember color temperature when augmenting lighting outdoors.

Indoors

All of the equipment you MIGHT need outdoors to help ensure proper lighting, you WILL need indoors. The event you're covering will most likely be lighted for human eyes and not for television. As you know, the camera requires a certain amount of light to operate, and it's your job to supply that light. This can be a serious problem in a lot of situations. The person in charge of the event may have reservations about television lights and the chance that they could interfere with the event itself. You have to know how the lighting could cause heat, glare and distractions to persons involved in the event, and reassure those responsible.

Consider having a properly lighted area for interviews off to the side somewhere. Think about lighting a portion of the event if you can't light everything that's taking place. In lighting an event indoors, also

consider your ability or inability to control all the light on the scene. If there is light of another color temperature that you can't eliminate, you must white balance for the mixture that you'll be shooting. If you eliminate some other light, be sure to repeat that step when the event actually occurs.

Much of the time, you will have to have a lot of tricks up your sleeve in cases where the event is taking place in a large area indoors. More and more, portable television cameras are requiring less light to operate. Know what your camera needs and be sure you operate within your system's limits, and be sure that both the technical and the aesthetic requirements of lighting are satisfied.

PRETESTING EQUIPMENT

Just because everything was working at the last event, doesn't mean that it's still going to perform up to standards for you. Of course, if you weren't the last one to have the equipment out, you will want to know that everything is still working before you depend on it. It has been transported since its last use and that in itself could be enough to cause something to malfunction.

There is no substitute for proper care of equipment and in spite of the best care, things still go wrong. The time to find out if something isn't working properly is before you need it. As you are undoubtedly becoming aware, every piece of your equipment plays a vital role in the accomplishment of your mission. One piece not working properly can ruin your whole production. Be aware of Murphy's Law (anything that can go wrong will go wrong), and take away as many possibilities of failure as you can.

COORDINATING TRANSPORTATION

During your site survey, you found out exactly what transportation would be required. Knowing about it doesn't get it done. You have to follow up and be sure that you can get everyone and everything to the site. Don't depend on someone at a motor pool somewhere understanding the importance of your mission. They have worries of their own and somehow your getting the event covered doesn't rank too highly on their list of priorities. Have emergency back-up plans to cover the possibility of someone not keeping their promise.

ASSIGNING AND BRIEFING PERSONNEL

Most of what you do as ENG team chief will touch on the responsibility of assigning and briefing personnel. Unless you are going to be doing absolutely everything yourself, and chances are, you're not, you will need to be certain that each member of the crew understands his responsibilities. To correctly assign personnel, you must know them. Know their strengths and weaknesses. Then it's a matter of using your resources properly. Assign personnel to the jobs they can best fill and keep them away from those tasks they're not qualified to perform. Above all, you must be sure they understand what is expected of them and what they need to do in order to accomplish it.

SUPERVISING ON-SITE SETUP

Unlike studio productions, where certain necessary elements are in place and set up all the time, every remote situation must be set up from scratch. As soon as you arrive on the scene, you'll begin to work on getting things in the order of the plan you made during the site survey. Cameras will be unpacked and placed at planned locations and set up on tripods. You'll already have built any necessary platforms, stands or barriers. Once you've accomplished this, the operators will power up the cameras and recorders and go through their checklists.

Those responsible for audio will unpack equipment, run cables and place microphones (hand, lavalier, boom, shotgun, etc.) at the proper locations. Depending on how many microphones and the likelihood of confusion, you may want them labeled with the name of the person who will use them. At each audio position, you'll want to run an audio check, then make certain the instrument is secured in a manner to make sure it won't be mishandled or damaged before the production.

All necessary lighting instruments should be set up, tested, positioned and focused. Since this takes a little time and everything else depends on lights, you may want the lighting setup to begin a little earlier than other things so that everyone won't have to wait for lights. For elaborate situations, you may even want the people responsible for lighting to arrive before everyone else.

Once everything is in position and set up, you'll want to check it to be sure that it all works properly. The transporting is over for now and what still works, will probably continue to work. Within reason, try to keep spare parts such as extra light bulbs and so forth, close to where it might be used. If a bulb were to burn out, you wouldn't want to hold everything up while someone had to run out to the truck to get a spare, or

miss covering that much of the event. Of course, you can't keep two complete systems on hand in immediate reserve either.

A final briefing before the action begins is always a good idea. Everyone should have one last chance to ask questions and clarify his role. That way, the team will know what each member needs to do, and be sure all bases are covered.

SUPERVISING REHEARSALS AND SHOOTS

If you have the opportunity, rehearse. The more you do anything, the better you'll be able to do it, and rehearsing the production will enable you to work out any difficulties as well as point out to you where they may pop up unexpectedly. An uncontrolled event such as fast-breaking spot news will certainly not allow for rehearsal, but if your crew has worked together in the past and rehearsed at every opportunity, they will be able to function as a tightly knit team in all situations. Even if an event seems routine to you, the entire team can benefit from rehearsal.

SUPERVISING ASSEMBLY OF THE FINAL PRODUCT

As stated in chapter three, after all the functions you've performed in announcing, writing, scripting and interviewing, there is still more to do. As ENG team chief, the same holds true. After all the functions that have been performed in surveying, coordinating, setting up, shooting and everything else, there is still more.

There are still to be made. What TREATMENT WILL YOU GIVE THE COVERAGE IN FINAL EDITING? Will you use music? Will you try to make the coverage hard hitting or just matter-of-fact? These are decisions that you, the ENG team chief, must make. You can seek and rely on advice from your crew, but in the final analysis, you are responsible. When credit is given for a job well done, it should be shared among everyone who contributed, for they all had a hand in keeping the standards up and making the product excellent. When the standards are not up and the product is not excellent, there is only one person to blame. The person in charge.

PRACTICE EXERCISE

LESSON 5

SUBCOURSE NO. DI0351

PERFORM AS ENG TEAM CHIEF

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- | | | |
|---|---|--|
| T | F | 1. Since the military trains personnel in all facets of ENG, it doesn't matter which person is assigned to which position in the crew. |
| T | F | 2. The camera microphone is the only acceptable way to capture natural or background sound. |
| T | F | 3. A production meeting after a site survey is a good time to be certain that everyone understands what is expected of him. |
| T | F | 4. Site surveys are to determine where all the production equipment and personnel will be positioned. |
| T | F | 5. After all the functions have been performed in surveying, coordinating, setting up, and shooting, the ENG team chief has fulfilled all his duties. |
| T | F | 6. If your equipment was working properly at the last production, and still functioning at the station, there is no reason to suspect it won't work well at the new location. |
| T | F | 7. It is the responsibility of the ENG team chief to decide what equipment should be purchased for remote productions. |
| T | F | 8. You should rehearse coverage of routine events. |
| T | F | 9. The ENG team chief is responsible for getting the entire crew to and from the site of an event. |
| T | F | 10. Camera positioning should not be determined until just before an event begins since plans often change and you want to avoid unnecessary extra movement of delicate equipment. |

Subcourse DI0370

October, 1987

Army Public Affairs Center
Fort George G. Meade, Maryland

Ten Credit Hours

GENERAL

The Basic Television Lighting, Audio, and Scenery part of the Broadcast Journalist 71R Skill Level 1 and 2 Subcourse, is designed to introduce Army broadcasters to an entry level understanding of three point lighting techniques, microphones used in various productions and related audio equipment and television scenery/backgrounds. This subcourse is presented in three lessons.

ADMINISTRATIVE INSTRUCTIONS

SUBCOURSE CONTENT

This subcourse contains three lessons, each related to the fundamental tasks of television lighting, audio and scenery for the Army Broadcaster. These lessons will provide a basic knowledge and understanding of the different phases of basic television lighting, audio and scenery.

Supplementary Requirements:

This lesson may be taken without any prerequisites.

Material Needed: You will need paper and T No. 2 pencil to complete this subcourse. No other materials are needed.

Reference. No supplementary references are needed for this subcourse.

GRADING AND
CERTIFICATION INSTRUCTIONS

Ten credit hours will be awarded for successful completion of this subcourse..

Task: In these lessons, you will first become familiar with basic lighting techniques and the requirements used for setup of simple television sets. Secondly, you will learn the two-categories and five types of microphones, their characteristics and usage. The functions of the two types of audio boards and related equipment. And finally, the role scenery, properties and set dressings play in the television environment.

Conditions: Given the material presented in this subcourse.

Standards: Demonstrate a basic knowledge and understanding of the fundamental techniques of lighting, lighting equipment, and the three-point-lighting method. Know the types of microphones, their characteristics and how they are used. And, the important role television scenery plays in the visual portion of a TV program.

BASIC TELEVISION LIGHTING

INTRODUCTION TO LIGHTING

Lighting for television is not only an art, it's also a science. The art of television lighting is creating certain moods and effects with lighting techniques. The science is the application of specific technical rules.

The broadcast journalist needs to be aware of these differences because they will affect the quality of the work in both studio and field production.

Television cameras will not reproduce a quality picture without proper lighting. Your eyes need much less light to see than does a television camera. Outside, the sun, moon and even stars provide illumination. Inside, table lamps, overhead lights, recessed lights and other lighting fixtures provide illumination. However, when you start to control illumination for the purpose of creating special moods or for technical reasons, you are involved in lighting for television.

TECHNICAL OBJECTIVES

The first thing you need to consider when learning the basic concepts of television lighting are the technical requirements of the television system itself. There are two basic objectives you must be concerned with: Quantity and Quality of light.

Quantity

In order for the television camera to see the subject, there must be enough illumination/light. A TV camera requires considerably more light than the human eye. If the overall light level is too low, you get what is called a "noisy or snowy picture, or none at all. When the picture is noisy, it looks grainy -- Similar to a photograph that has been enlarged a great deal.

Another aspect of the quantity of light is the intensity of the shadows in the scene. A television system can accommodate a contrast range, of NOT more than twenty times darker than the brightest element of the scene.

LESSON 1/Learning Event 1

If shadows are darker than 20: 1 there will be reproduction problems for the camera. For example put yourself in a dark room and have a flashlight available. You will be able to find any object in the room. But a television camera in the same room, under the same conditions, would not be able to identify a thing. That's because your eyes have a contrast ratio of 160 to 1, but a camera only has a ratio of 20 to 1.

With too much light, subjects have an appearance of glowing or "blooming". This, when seen on television, shows a washed out appearance. Obviously both situations are unacceptable.

Light Meter. The most common method of finding out if a scene or subject has enough light to reproduce a good quality television image, is by measuring the amount of light falling on or reflected by the scene or subject. This is done with the aid of a light meter. The meter measures light by allowing light to strike a light sensitive strip or cell which produces a small electric current. The amount of current produced is directly proportional to the amount of light entering the meter. A lot of light produces more current and a little light less current. The current in turn moves a needle over a printed scale. (Fig. 1-1)

Figure 1-1
Light Meter

LESSON 1/Learning Event 1

The scale is calibrated to indicate how much light is entering the meter. The scale is normally calibrated in footcandles but may also be marked in lumens (which are equal to footcandles). The footcandle scale is normally used in television.

Quality

Let's take a look at the second technical consideration. The quality of light refers to the color temperature of the light source. Color temperature is properly termed "Kelvin Temperature." This refers to the amount of red, yellow and blue-white quality in the light, and is expressed in "degrees Kelvin". Do not confuse color temperature with footcandles. Footcandles measure the intensity of the light, not its color temperature.

Color cameras may be balanced to any color temperature. But, the television industry has set 3,200 degrees Kelvin as the standard for studio lighting. The outside color temperature from the sun on a bright day is rated at 5,600 degrees Kelvin. This standard may not always be consistent, because clouds filter the sun's light and create a different color temperature. Different color temperatures will cause unpredictable color distortions. Such distortions might produce purple faces. Mixing lights of different color temperatures will produce other technical problems. Most quartz halogen bulbs used in television produce 3,200 degrees of color temperature. DO NOT try to use stage lights from a theater. Stage lights use a different color temperature, and will throw the color TV cameras off balance. Using lights other than those designed for 3,200 degrees Kelvin will cause engineers many problems.

There are many different makes and models of light meters with multiple options and functions. When you start to work with a light meter, take the time to read the operating instructions and become familiar with the meter. A little practice in reading the meter and you will have the technique in no time.

LESSON 1/Learning Event 1

Measuring Light. There are two methods of measuring the light in your studio.

a. Incident

b. Reflected

1. Incident light reading. Measuring the actual light falling on the subject is called "incident" light measurement. To take an incident light reading, a light meter is held near the subject, but the top of the light meter pivots, and should be facing the light source. The meter measures the amount of light falling on the subject. The incident light meter reading is the most commonly used method in television (Fig. 1-2).

Figure 1-2
Incident light measurement

2. Reflected light reading. The second method of measuring light is called a "reflected" light reading. A reflected light meter reading measures the amount of light reflected from the subject.

Figure 1-3
Reflected light measurement

The reflected meter reading is used in television primarily when the overall scene is composed of dark colors. (Fig. 1-3)

AESTHETICS

The needs of a lighting technician do not end once the technical requirements of lighting the set have been met. Certain aesthetic or non-technical objectives are mood, form or dimension, and directing attention.

Mood

Using shadows and different light levels discreetly will set the mood of a program or scene, and even the time of day, when necessary. Every scene has some sort of mood to convey. Usually, the set and lighting should work hand in hand to accomplish this effect.

Dimension or Form

Television is currently a two-dimensional medium. In the future, there may be 3-dimensional hologram TV. Right now the TV screen has only height and width, but there are ways to create the illusion of the third dimension "depth," with effective lighting. While we need to be careful of creating harsh shadows, we need some shadows to create form. By using backlight on a subject we separate objects in the foreground from subjects in the background. This technique gives the illusion of depth and dimension.

Directing Attention

Directing the viewer's attention can be done in a number of ways. The most obvious way is to use a "follow spot." A follow spot is a spotlight that keys in on a particular subject and follows that subject, directing the viewer's attention. Normally though, we will want to be a little more subtle. Using key and fill lights properly to direct attention will do the same thing without being so obvious.

Important Note: Each situation for lighting a set or scene is different. Separate illumination should be used for the background, foreground and subject at all times. Attention to each step of the lighting setup is needed to accomplish specific requirements. Take time when attempting these tasks. As a broadcast journalist, be aware of the objectives and how they apply to each project. The difference between excellent lighting and adequate lighting is the dedication, not the time spent.

LIGHTING INSTRUMENTS

There are two primary types of lights used in the three-point lighting method spotlight and the floodlight.

Spotlight

A lens spotlight provides a variable focus or beam spread of light (Fig 1-4). The light field is smooth, even, and

Figure 1-4
Spotlight

the outer edge of the spotlight beam is less intense than the center. They are very directional, have a highly polished reflector and a relatively thin, lightweight clear lens. They may be used in many situations such as key light, backlight and other spotlight applications.

Floodlights

The floodlight is a wide-angled "scoop" used to provide fill and base light with a very wide, diffused beam (Fig. 1-5). The bulbs are exposed inside a brush-finished reflector with no lens. Fiberglass scrim or metal mesh may be placed across the front in a special holder to dim the light.

Figure 1-5
Floodlight (Scoop)

THREE-POINT LIGHTING

With all the information presented here, it may seem very difficult to provide light for television. However, following proven photographic lighting techniques makes the task manageable.

The methods for lighting all non-visual mediums such as motion picture photography and television originated from still photography. The basic three-point lighting format (Fig. 1-6) is still the basic photography layout.

Figure 1-6
Three-point lighting

LESSON 1/Learning Event 4

Key Light. The key light is the primary source of illumination when setting three-point lighting, and should be set up first. Generally, the key light is placed at a 45-degree angle to the left or right of the camera and above. When lighting is natural, the light comes from above. So the key light should also be elevated above the level of the camera in relation to the subject. The main function of the key light is to bring out the basic shape of the main subject. The subject will have a very dark shadow. A key light or spotlight allows a great deal of directional control over the light source.

Backlight. The secondary light source is the backlight. The backlight is used to separate the subject from the background and provides the illusion of a third dimension -- depth. A spotlight or key light that has been shaded to prevent "flare" is always used for the backlight. Flare is the excess light that enters the camera lens when the backlight is not positioned properly. "Barn doors" must be used to prevent direct light from entering the camera lens. Barn doors are used to direct light coming from a lighting instrument. The doors shade the light itself on the top and bottom.

Once the key light and backlight have been set, the definition or dimension of the object should show quite well. But the fall-off area from the light to dark area is very fast. So we need to fill these areas in, and this is accomplished by using a fill light.

Fill Light. The fill light is the third light source and has a more diffused characteristic compared to the key light and backlight. In three-point lighting, a fill light or scoop is used to fill in the dark areas created by the key and backlight. The main function of a fill light is to reduce shadows. Don't eliminate all the shadows, because we need some shadows to create depth. The fill light should be placed opposite the key light at a 45-degree angle above the camera.

The ratio or contrast range of key light to fill light is best when kept to about 2:1. This means that the key light is twice as bright as the fill light. This reduces the contrast range or shadow density but still leaves enough shadow area to create, rather than eliminate, the three-dimensional effect.

CONTROLLING LIGHT

The lighting instruments themselves will hang from the ceiling on a series of pipes or battens called a "grid." These lights plug into a series of electrical outlets which are numbered and are attached to, or mounted in a strategic location, along the lighting grid.

The lights are fastened to the grid by a "C" clamp that is attached to an accordion-like device or telescoping pole, called a "pantograph." The C-clamp is a clamp that looks like a "C" -- with a locking bolt that is threaded through the open ends of the C clamp. Pantographs allow vertical (up and down) movement to vary the height of the light.

The electrical outlets in the grid connect to a central electrical "lighting patch panel" either in the same studio or another room. The patch panel is used to assign each individual light to a specific control or dimmer switch.

These in turn are connected to a dimmer bank of switches that are used to control a group of lights. This allows the technician to group lights together. Therefore, all fill lights are put on one bank, key lights on another, etc.

Lighting instruments have many physical sizes but they all produce two basic types of light:

- o Directional
- o Non-directional or diffused light

Remember that the object is not simply to turn all the lights on and point them toward the subject. The controls that are used to blend and shape lights to meet our technical and aesthetic objectives must now be put into practice. We will look at how we can control the intensity, direction and color of our light.

Intensity

There are several ways to control the brightness or intensity of the light falling on the subject. The most convenient way is by using dimmer circuits. These circuits work by reducing the amount of electrical current to the bulb. While dimmers are very convenient and easy to use, they have one major drawback. As the amount of electricity

LESSON 1/Learning Event 5

decreases, the filament of the bulb dims and color temperature changes, giving an increasingly reddish light. Most experts agree that we may dim a light to about 85 percent of its rated voltage. This decreases the color temperature about 200 degrees Kelvin without a noticeable change in color.

Beware of using dimmers, especially for light that falls on a subject's face or skin. Flesh tones are the only true way of adjusting color levels on a viewers set. If we alter that color in any way, our reference will be lost. And all the color levels, on all the television sets receiving the video picture, will end up out of adjustment.

Another way to reduce the light intensity is by increasing the distance between the subject and the light. Remember, as the distance increases, the angle, distribution and light intensity changes in direct proportion to the subject. Putting "screens" and "scrims" in front of your light also reduces the intensity of your light. Screens are used mostly on directional lights because they do not alter the hard directional light beam or affect color temperature. A scrim is made of translucent gauze or glass fiber material. The fiber diffuses the light beam and decreases light intensity.

Barn doors. Barn doors are adjustable metal shutters, resembling doors, that allow the operator to control the edge of the beam of light. The barn doors slip into a slot on the front of the lighting instrument (normally fresnels). Barn doors are used to shape the light. The doors come in two-and four-door varieties.

Some spotlights have a built in "lens" control that does the same thing as a set of barn doors but with more accuracy.

The lens control allows a very accurate amount of light to be targeted to a specific area.

Scrims and screens. Scrims and Screens are placed in front of a light source to soften and diffuse the light. One layer of scrim material will normally reduce light output by 50 percent. Thus, the scrim reduces light output and softens and diffuses the light. The scrim does not affect the color temperature of the light. If there is still difficulty in getting the right intensity, the wattage, not the voltage, of the bulb in the fixture is changed.

Direction

The directional control for lighting comes from the grids, clamps, and pantographs or other hanging devices in the studio. Lights may be hung and pointed in any direction.

Effects lighting. Lights coming through windows and doors may be used to highlight a specific area or object dictated by the script or setting. An "eye light" can add sparkle to a performer's eyes and teeth or small objects in dark corners. The effects lights are the last lights added to the set. These are added to correct deficiencies of the key, back and fill lights. Poor lighting should be corrected by adjusting or relocating the key or fill light already in place.

Color gels. Gels are available in a wide selection of colors. They are placed in front of the light in the same way scrims and screens are positioned. Color lighting is used sparingly in television because flesh tones are used as a color reference. Do not splash color on the subject unless there is a special reason, and then, only when the engineers have been informed. Color gels are used primarily to place color on cycloramas and/or sets.

Light for color television. A major consideration in lighting for color television is the color temperature of the lighting. Color cameras are normally balanced electronically for lighting that has a color temperature of 3,200 degrees Kelvin. Most tungsten-halogen or quartz-iodine bulbs are manufactured with this specific color temperature.

We are most interested in lights that affect skin tones of a subject. For this reason we will seldom, if ever, use color lights on a television subject. When the lights are on a dimmer, always try to maintain the color temperature of 3,200 degrees Kelvin (plus or minus 200 degrees).

Final check. The final check for determining adequate light levels may be made by viewing the results on the control room TV monitors. The engineers will indicate which level is the most technically accurate.

***** SAFETY WARNING *****

All television lights become extremely hot when they are used. You may receive serious burns if you are not careful. Be careful when you are adjusting barn doors, scrims, etc., after the lights have been on. After use lights remain extremely hot for about 5 to 10 minutes.

PRACTICAL EXERCISE

LESSON #1

BASIC STUDIO LIGHTING FOR
TELEVISION

SUBCOURSE No. DI0370

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling "T or F" next to each question. Compare your answers with the answer key on the next page. Ensure that you understand the lesson material and answers before proceeding to the next lesson.

- T F 1. There are two basic lighting objectives.
- T F 2. You can control the intensity, direction and the color of light in a studio.
- T F 3. The color temperature that is the industry standard is 3,100 degrees Kelvin.
- T F 4. Backlight, properly used, is the main contributing factor used to create the illusion of a third dimension.
- T F 5. The best lighting ratio for key light to backlight is 1:1.

INTRODUCTION TO BASIC AUDIO

SOUND THEORY

In this lesson, we will describe the fundamentals of sound and how it is transmitted. Let's begin with the theory of sound. Everything that takes the form of matter --solid, liquid or gas --is made up of micro bits of material called molecules. We can't see the molecules because of their size. These molecules stay approximately in the same location until they are disturbed. When this happens they collide.

During the collision, the molecules transfer energy to each other through whatever material they are made of --solid, liquid or gas. In sound theory, molecules continue to collide with each other until they make contact with the ear. The ear picks up the vibrations or pressure waves (energy) and channels the vibrations into the eardrum where they are converted into electrical signals. The brain then process the signals. The conversion from pressure wave to electrical information in the brain produces what we know as sound.

MICROPHONES

A microphone, like the ear, is a transducer that converts acoustical sound energy into electrical energy. The energy is then amplified and transmitted to a speaker. All microphones are basically the same. They all have their own housing, diaphragm, magnetic field and moving parts within that field. Until a sound wave is changed from the wave in the air to an electrical form, it can't be used electronically. This is the function of the microphone.

Microphones are classified by the way they change the sound waves into electrical energy. There are two components microphones must have to change sound energy into electrical energy:

1. a diaphragm, which vibrates in response to sound pressure
2. a generating element, which changes the physical vibrations of the diaphragm into usable electrical energy.

According to their principles of operation, microphones are separated into two categories. They are:

1. pressure-operated microphones
2. velocity microphones

Pressure-Operated Microphones

There are several types of pressure-operated microphones: carbon, crystal or ceramic, and condenser or capacitor. When someone speaks into a pressure-operated microphone, the diaphragm vibrates in response to the air pressure from the sound (See Figure 2-1). These vibrations cause the voice coil to move back and forth within a magnetic field. The coil produces a fluctuating electric current which, when amplified and transmitted to a speaker, reproduces the exact sound the microphone picked up initially and makes the sound audible to the listener.

Figure 2-1
Pressure-operated microphone

Velocity Microphones

The velocity or ribbon microphone employs the moving conductor principle, in which a thin, flat piece of metal is suspended, so that it vibrates freely in a magnetic field. In this case, the ribbon element is the diaphragm. Again, a generating element changes the vibrations of the diaphragm into electrical energy (Fig. 2-2). The ribbon is not encased in a closed housing; it's exposed to the air on all sides. This type of microphone is very fragile. Any sharp, loud blast of air close to the microphone, may damage or even destroy it.

Figure 2-2
Velocity-operated microphone

ELECTRONIC CHARACTERISTICS

All audio broadcasting and/or recording begins with the use of a microphone. "Mike's" as they are commonly referred to, may be grouped into three classifications according to their directional pickup properties.

1. unidirectional (one direction)
2. bidirectional (two directions)
3. omnidirectional (all directions).

LESSON 2/Learning Event 3

Some mikes belong to only one class while others can be changed or adjusted to either of the other two. Microphones do not pick up sound equally from all directions. The pickup pattern of a mike will tell you how to best place the microphone or subject for optimum sound reception.

Unidirectional Microphones

The pickup pattern of the unidirectional microphone is, roughly, the shape of a heart or cardioid pattern. These microphones accept sound best at the 0 degree point with minimal response at the 180 degree point (Fig. 2-3).

Figure 2-3
Unidirectional

Figure 2-4
Bidirectional

An example of the value of a unidirectional or cardioid microphone would be a singer performing with an orchestra. Let's say the singer uses a unidirectional mike. Its dead side may be turned toward an orchestra so the orchestra will not overpower the singer. Another example would be a speaker addressing a group. The unidirectional mike will only pick up the speaker talking. The side noise will not be heard, or if it is, it will be very faint. The unidirectional microphone must be pointed in the direction of the sound source for best results.

Bidirectional Microphones

This particular microphone has a figure eight type pickup pattern. The dead side of the microphone is on either side. This configuration accepts sound best at the 0 degree and 270 degree axis points or sides (Fig. 2-4). In radio, with two or more performers, the bidirectional microphone is usually preferred. When two or more people perform at a bidirectional mike, they not only feel less crowded. They have the advantage of playing to each other, thus giving them a feeling of natural, human interaction.

Omnidirectional

Omnidirectional mikes accept sound equally well from all directions without any loss. There are no variations in this pattern (Fig. 2-5). This microphone allows the performer to talk from any direction. The omnidirectional mike is particularly valuable for round table discussions and for voices in a group.

Figure 2-5
Omnidirectional

CATEGORIES OF MICROPHONES

There are two types of microphones: the dynamic and the velocity.

Dynamic

The most popular microphone in broadcasting is the dynamic microphone. The dynamic mike is the most ruggedly constructed of all the microphones. The dynamic microphone is used in all types of environments, both in studio and on remote assignments. This is because the dynamic mike has a low wind-noise characteristic. This trait and its dependability make the dynamic mike the most trusted of all microphones. The dynamic mike tends to favor high-frequency over low-frequency sounds. Because of its inherent high-frequency cutoff, the dynamic mike tends to accentuate sibilance in a person's voice. Sibilance is a hissing sound made when the letter "s" is pronounced. Dynamic mikes are pressure operated microphones.

Velocity

A close relative of the dynamic mike is the velocity microphone. This is the old standby for the broadcast and recording industry. The velocity or ribbon mike has a superb uniform frequency response between 20 to 20 thousand hertz. This may be seen with an audio test generator. The ribbon mike is extremely sensitive and should never be used outdoors. A strong wind may break the ribbon rendering the mike useless. The ribbon element is enclosed by a screen. The velocity microphone has a tendency, because it's so sensitive, to make performers "pop" their p's, b's and t's if they get too close to the mike. The explosive quality of these letters causes a very sharp, momentary increase in the pressure component of the sound wave. This may sound to the listener like a very small firecracker exploded in front of the microphone.

The velocity mike tends to favor low-frequency over high-frequency sounds. Consequently, a velocity mike may be used to deepen the voice. A unique characteristic of this mike is the closer the announcer gets to the microphone the deeper his voice will sound.

Condenser

The condenser or capacitor microphone is the mike that is chosen most by professionals. This microphone has the most exacting reproduction of sound with perfect uniformity and full-range response. The condenser mike is a pressure-operated microphone and operates on the storage of an

electrical charge which requires a battery or power supply. The head of the mike contains two plates. One plate is the diaphragm, the other is a heavy backplate. The backplate is insulated from the diaphragm and spaced parallel to its' rear surface. As sound waves enter the mike, the sound pressure causes a change in the spacing of the two plates. This varies the internal capacitance and the voltage of the battery or power supply to the signal current. The condenser mike, with its battery, has an extremely low electrical output and requires its own power supply. Because of its technical complexity and accuracy, it is one of the most expensive microphones to manufacture.

MICROPHONE PLACEMENT

Microphone placement in a radio studio is simple. The mikes are normally placed on a desk stand ready for use. Radio studio microphones are usually placed on a 45 degree angle, about four to six inches from the announcer's mouth. However, this is only a suggested guideline. As each announcer becomes more accustomed to a particular mike, they may want to move it around to get the best results for themselves.

Microphone placement is more critical for television if and when the mike is to be seen on-camera. The mike should not interfere with viewing the picture or distract the eye of the viewer by being in strange locations.

KINDS OF MICROPHONES

Lavalier Microphone

The most commonly used microphone in television is the lavalier (Fig. 2-6). The "lav" is always omnidirectional. When an announcer uses a lavalier, he talks across the mike rather than directly into it. Because it is omnidirectional

Figure 2-6
Lavalier microphone

the lav has a tendency to pick up studio noise and must be positioned properly to avoid this situation. Have the production personnel place the mike on the subject. The untrained guest who puts on his own microphone probably will position the lav where it looks best rather than for best sound pick up.

A good rule of thumb for positioning a Lavalier microphone is to place the mike in the direction the performer will face. For example, during interviews, the host and guest should face each other at about a 45 degree angle. The microphone should be attached to their lapels on the side where the host and guest face each other.

Figure 2-7
Lavalier placement

Do not place a lavalier microphone under a tie or clothing (Fig 2-7). This may result in muffled audio or extraneous clothing noise when the microphone rubs against the material.

The lavalier microphone is a good tool to use when movement is required on the set. For example, a weather report where movement is required by the weatherman from a sitting location to a standing location in the weather maps area. The lav is attached to his clothing which allows freedom of movement to the weatherman. This enables him freedom to move to the maps and back again to the set with a minimum of problems.

Desk Microphone

The desk microphone is attached to a small stand and placed on a desk or table top. The front of the mike should be pointed in the direction the announcer will normally face during the production (Fig. 2-8). Desk mikes are very sensitive to external noise. Announcers should be reminded not to tap or kick the desk.

Figure 2-8
Desk microphone

Hand Microphone

The hand held microphone (Fig. 2-9) is commonly used by radio and television reporters for interviewing in the field

Figure 2-9
Hand microphone

LESSON 2/Learning Event 6

and by entertainers. The interviewer and performer have complete control over the positioning of the microphone, since they hand hold the mike. Because both news people and entertainers need to move around, this mike is an excellent choice.

Stand Microphone

This is basically a hand held microphone positioned on a tall stand and frequently used by singers or placed near musical instruments (Figure 2-10). The stand microphone is normally preset to the subject's height for ease of use.

Figure 2-10
Stand microphone

Shotgun Microphone

The shotgun microphone is designed to pick up sound and not be in the picture. This is particularly useful when it is not possible to place a microphone on a speaker's lectern. The shotgun mike may be several feet from the speaker and still pick up acceptable audio. Because this mike is highly unidirectional, the shotgun locks in on the main source while eliminating most ambient or side noise. The shotgun

LESSON 2/Learning Event 6 and 7

microphone is specifically designed to gather sound from the front and suppress sound at the sides and rear of the microphone (Fig. 2-11).

Figure 2-11
Shotgun microphone

ACOUSTICS

Most studios are acoustically controlled for recording. However, many recording situations will not be in the controlled environment of a studio. An empty room reflects sound and therefore, records differently than that same room filled with furniture; a small room sounds differently than a large room; inside acoustics are much different than outside.

For example, when covering an open-air speech where a large crowd is present, the main consideration should be recording the speech and keeping the ambient or outside noise from interfering. An omnidirectional microphone will pick up the speaker and the ambient sound. In this situation, a unidirectional microphone should be used, eliminating much of the ambient noise and keying in on the main speaker.

An interview conducted in a room that has a hollow sound presents other problems. Rooms with high ceilings or sparsely furnished and containing many hard surfaces will create this hollow effect by causing the sound waves to bounce off the hard surfaces. A bidirectional mike should be used here because this type of mike picks up sound best directly in front, and in back, with decreasing sensitivity at the sides. (See Fig. 2-4)

When conducting an acoustical analysis, it is important to know the directional characteristics of the microphones that are available. The audio person must take all possible audio situations and problems into consideration. Examine the alternatives and then select the type microphone that will provide the best pickup for the specific situation.

ACCESSORIES

Professional mikes and cables use standard jacks or connector plugs called "Canon XLR" connectors or "Canon Plugs". The canon plug is a three pronged plug with male and female connectors. Generally most audio outputs, such as the microphone end, use the male plug while most inputs in the studio audio connector box use a female receptacle. When connecting these plugs, listen for a click which tells when they are joined. When taking them apart, be sure to release the safety lock or the wires may be pulled out of the connector.

Windscreens/Filters

Most microphones are sensitive to loud, sudden, sounds and wind noise. "Pop filters and screens" are used on mikes to diminish these sounds. Pop filters are built in electronically and are usually used in dynamic microphones. Windscreens are external attachments on any mike that cover the microphone. Pop filters and screens will not eliminate all the unwanted sound but they will help. They are excellent tools to use against unwanted distortion or loud sounds.

LESSON 2/Learning Event 8

These filters slightly reduce the frequency response of a microphone (Fig. 2-12).

Figure 2-12
Windscreens

Connectors

Audio connector boxes are usually located low to the floor along the studio wall. These boxes usually will contain female receptacles. Connecting a microphone is easy. Just line up the pins to the female connector and push them together. To release a mike from a receptacle, push the release button. Use caution when inserting and removing a cable and handle the cable by the metal connector, NOT by the wire. Pulling on the cable may damage the wires inside. A little care will prevent a lot of problems.

Fig. 2-13 shows the different types of connectors that you may run into in a studio or field situation.

Figure 2-13
Connectors

Cables that are not in use should be neatly coiled. Be careful not to wrap them too tight or damage to the wires inside may occur. If cables or connectors are abused, they may not function when you need them. Before leaving for an assignment, always inspect the cables and connectors before you plug them into an input.

Make sure you have enough audio cable. You need to have a sufficient amount to allow for subject or crew movement and to keep it out of the camera view. It is important to have enough audio (mike) cable so it can be taped out of the way of traffic areas. When cables are run across the floor, tape them down so that no one will trip.

CONSOLE FUNCTIONS

All control consoles in the broadcast industry have the same basic similarities. Learn one control console thoroughly and be able to operate it properly and, in most cases, the other audio boards will be less difficult to operate. So take the time now at your earliest opportunity to learn audio operations and procedures.

An audio control console has three primary functions:

1. amplify sound
2. control sound
3. route sound

Amplify Sound

Amplification is accomplished when different levels of sound are received by a microphone, turntable, or tape playback sources. The audio levels are then amplified into a greater or usable sound without distorting the quality of that sound.

Controlling Sound

Sound is controlled through the use of potentiometers (pots) or faders that increase or decrease the level or intensity of the audio elements.

Routing Sound

This channels the sound by activating specific input program selector switches and turning or sliding the faders to a desired level. The sound is sent to a specific area left for Audition, the middle for Off and right for "On Air".

CONTROL CONSOLES

The operator sits in front of the audio board and operates the equipment. The audio console is an indispensable part of any audio system using more than one or two

LESSON 2/Learning Event 10

"input sources". Input sources are items of equipment like mikes, turntables, etc., that are connected to the audio board. The console allows selection from a large number of audio inputs, allowing the operator to blend or mix those selected sources into a signal output. There are two basic types:

1. Traditional monaural/stereo console.
2. Modular mono/stereo console.

Figure 2-14
Traditional monaural/stereo console

Traditional Mono/Stereo Board

The front panel has a fixed placement of knobs, pots, switches, volume speaker controls, and one or two VU meters (Fig. 2-14). These are the older boards.

Modular Mono/Stereo Console

These are the most current audio boards. These have operating panels designed for specific applications. They have volume speaker controls, faders, mixer keys and VU (volume unit) meters (Fig. 2-15). However, "vertical linear faders" are used instead of the standard circular pots for mixing. A vertical pot is also called a linear fader.

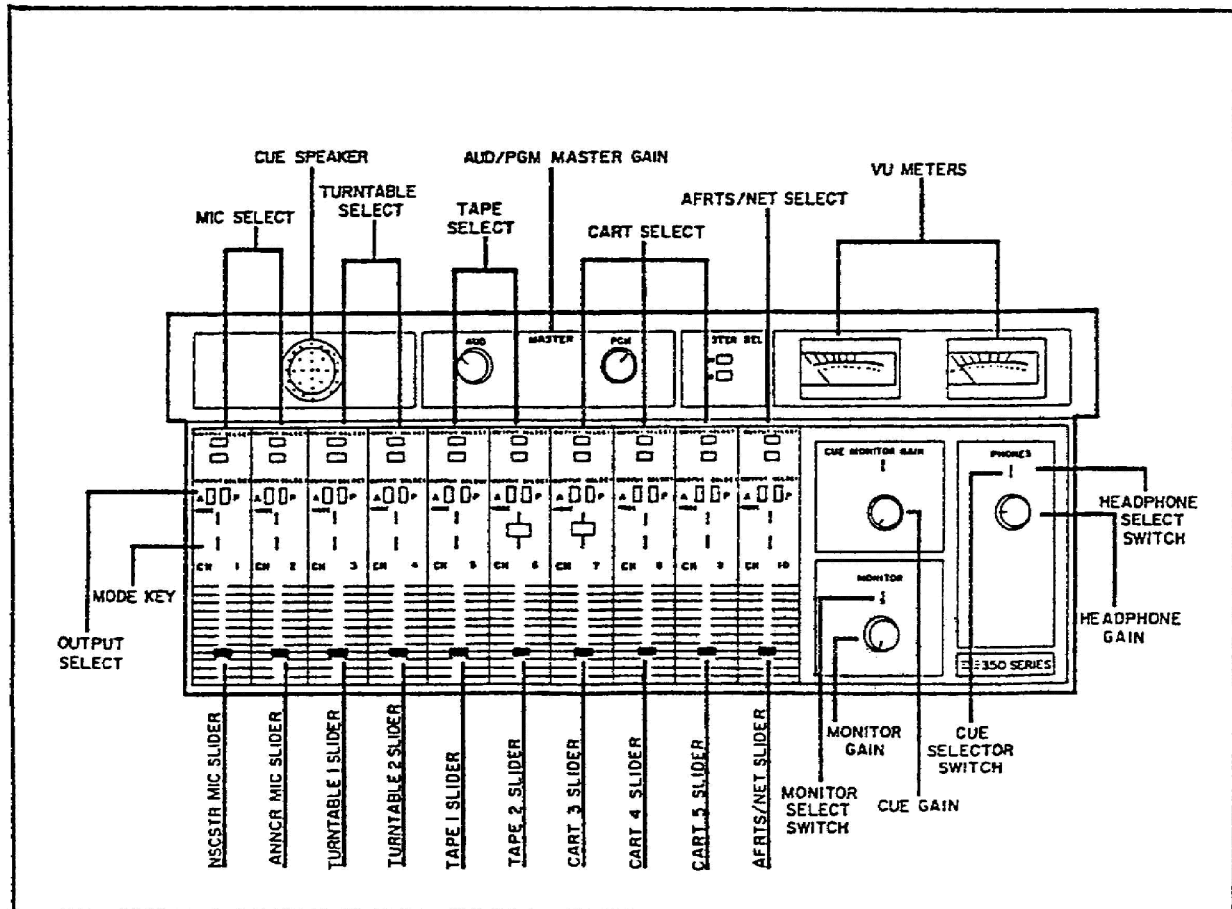

Figure 2-15
Modular mono/stereo

LESSON 2/Learning Event 10

The vertical faders appear on the console face as sliding knobs that are moved up and down to control the sound level or intensity. "Output channels" direct the sound to a specific location, i.e. PROGRAM, OFF or AUDITION.

VU Meter

Above the individual faders/pots or controls, right in front of the operator, is a large meter(s) called the "volume unit" or VU meter. The volume meter is an essential tool in dealing with audio levels or signals. It is impossible to determine how loud a sound is, or how loud we think the sound is without a VU meter to tell us. VU meters are expensive and delicate. All audio levels are set with the VU meter. Look at the VU meter (Figure 2-16). Notice there are two scales. The upper scale is read in volume units, from -20 to 0 and then +3. The zero mark is a representation of "decibels or db" with zero db equal to 100 percent modulation or audio without distortion. The newer VU meters have 0 to 100 on the top scale and the decibels on the bottom scale. Beyond zero, the scale is marked in red. Sound level readings in this area, should only be permitted momentarily because these readings indicate volume unit (VU) distortion in the audio signal.

Figure 2-16
VU meter

The lower scale has a range from 0 to 100 and is a reflection of that percent of modulation. When the audio signal exceeds 100 percent modulation the scale indicates red. This is called "in the red" and is not a desirable place to be. When the needle is all the way to the right, we say "the needle is pegged". Pegging the needle may damage the needle mechanism by bending the needle. This will cause inaccurate readings. When the needle reading is down around the minus 20 mark, at the left, we say we're "riding in the mud". Riding in the mud means that the audio level is too low and should be brought up. The term "Riding Gain" refers to the amount of sound level or volume that the needle is measuring. Riding or monitoring gain with the VU meter then consists of watching the moving needle while adjusting the pot that controls the sound. The normal acceptable level for riding audio is between 80-100 per cent VU modulation and should read this at all times.

RELATED EQUIPMENT

Additional control room equipment includes turntables, cartridge and/or cassette tape recorders, speakers, clocks, remote controls and filters.

Turntables

A turntable is a high-quality record player that play records at speeds of 78, 45 and 33-1/3 revolutions per minute (rpm). The 78 rpm speed is seldom used today. The most common speeds are 45 and 33-1/3 rpm.

Tape Recorder

Audio tape recorders have three operating formats: reel-to-reel, cartridge and cassette. Entire programs, special events, and on-the-spot news items are recorded on tape, in these three formats for later insertion. Talks by inexperienced speakers may be taped and later "edited" to remove those embarrassing long pauses. The ease of editing, plus the ability to "erase" the tape and reuse it makes the tape recorder a requirement of good broadcast operations.

Reel-to-Reel. Tape recorders for broadcast use are operated at 3-3/4, 7-1/2 and 15 inches per second (ips). The

playback and recording heads on a tape recorder are the heart of the recorder. The three electromagnets are called heads. The tape heads are arranged in a line near the tape transfer mechanism. They are aligned from left to right: erase head, recording head and playback head. The tape recorder consists of:

1. A tape transfer mechanism which moves the tape from a feed reel, past the tape heads, to a take up reel at a constant speed. The constant speed is maintained by a capstan motor that pulls the tape through a pair of tangent wheels or rollers.
2. A speed-changing and start switch which allows the operator to change speeds. The speeds are either 3-3/4 to 7-1/2 or 15 ips and/or any combination of the three depending on the designs of the recorder/reproducer. The start switch is positioned to start the record/play back process and/or fast forward and reverse.
3. A recording amplifier to impress the sound onto the tape through the record head.
4. A play back amplifier to feed the sound from a previously recorded tape to the audio control board. The sound on the tape activates the play back head which in turn sends it to the play back amplifier.
5. An erase head or oscillator to clean unwanted, previously recorded sound from the tape. The erase oscillator operates the erase head which then erases the tape. This oscillator operates at a frequency above human hearing at about 25 kilohertz.

Cartridge Recorders/Reproducers. Cartridge machines use a plastic case containing a cartridge that has an endless tape loop. The tape rewinds itself as it is played back. An inaudible tone is placed on a tape by the operator for cueing purposes. This tone will rescue or stop the tape at any specific location on the tape the operator wants, automatically. In recent years, cartridge tapes have been used in place of turntables for playback of recorded transcriptions or records. This saves the records from repeated use when they first appear on music charts. News and sports announcers use cartridge tapes for recording on-the-spot events. Cartridges are also widely used in radio

and television for recording station identifications (ID's), program themes, sound effects, announcements and public service announcements (PSA's).

The cartridge tape recorder is designed to use a standard tape cartridge holding tape lengths of from 20 seconds to 31 minutes play time, at 7-1/2 ips. Cartridge tape uses the half-track format with program material recorded on one track and cue pulses recorded on the other. The cue portion of the tape has a pulse at the beginning of the program material to cue the tape. After the audio program material has played, the tape continues to roll silently through the cart until another cue tone is reached. The tape will then automatically stop. The cart may then be removed and played at a later time.

Cartridge tape may be bulk erased and re-used just like reel-to-reel tape. Cart machines are manufactured as either recorder/reproducers or as reproducers only. Storage racks are available for wall mounting or as mobile rotating stands that hold from 20 to 200 carts for studio use.

Cassette Recorder/Reproducer. The cassette recorder was originally designed for use in home entertainment. However, in recent years, they have been put to use in broadcasting by reporters for on-the-scene coverage, conducting interviews and as an audio cassette broadcast system.

Speaker

The control room speaker is an important guide to both operator and director. During a broadcast, the speaker reproduces what is on-the-air. During rehearsals, what is heard over the speaker is the basis for audio corrections and for the director's suggestions to the announcer or performers. The control room speaker may be turned up or down to a comfortable level in the control room. This does not affect what 's going over the air for broadcast or recording. There are normally two sets of speakers. The broadcast monitor speakers and the cue channel speaker.

Clocks

In radio and television, everything runs by the clock. For this reason, all clocks should be set properly. This

indicates a well run station to the listeners. Adequate consideration should be given to what clocks are used for and what types are available.

Round-face clocks are the most commonly used time instruments. They should be large enough to be read easily from anywhere in the studio. Large plain numerals and hands are a must. A 12-hour face is more desirable than a 24-hour face with small markings. A second hand is essential.

The second hand should move in one-second increments, rather than one smooth circular motion found on most household clocks. All clocks should be synchronized either by a master timer or by resetting once or twice a day as needed. It is not unusual for a majority of the non-essential clocks on a military installation to be set from times given over the radio or television. Don't confuse the listeners.

Clocks with a digital read-out have become extremely popular in recent years. The electronic read-out is preferable and generally more accurate. Some of these units may be used as clocks, standard counters, countdown timers, and stop clocks. However, some individuals can't visualize the remaining time in a program, the elapsed time or cue time, as readily as they can with the more familiar circular face clocks.

Timers

Timers are essential tools for good production work in broadcasting. They may range from a simple stop watch or photographer's timer, to an elaborate electronic timer capable of starting and stopping equipment. In broadcasting, it's generally preferred that the timer have at least start and stop capability without having to be reset to zero.

Remote Controls

Remote controls are switches that operate equipment located some distance from the audio control board. These controls allow the operator to function from a central location without having to physically touch the equipment. These remote controls are available from the equipment manufacturer.

TERMS

The following is a list of terms that will help the student better understand broadcast terminology.

Pots. Pots are the round knobs or linear (vertical) faders used to increase or decrease sound levels on an audio control board.

Inputs. Audio "inputs" to the console are normally "hardpatched," that is, permanently wired into the console. For example, mike number one and two will probably always be fed to their individual pot. The operator uses the selector key to determine if microphone number one or two will be in the audition or in the program mode and fed into the pots. Newer boards use a linear fader. This type of fader is a vertical attenuator or pot. The linear fader slides up and down a graduated scale. The strength of the signal increases in a linear or straight line output. The scale graduation has a closer tolerance.

Outputs. The next step is to determine where the signal is going. We normally have three choices: cue, audition or program. The cue system amplifier will let the operator hear the input signal. This signal does not reflect on the VU meter nor does it go out over the air. The cue system is solely for the operator to hear what is going to air. The cue system has its own lower quality speaker, and distinct sound. The speaker quality allows the operator to tell the difference between the on-air audio and the next source audio in cue.

Channel selector switch. Immediately above each pot is a three positioned switch. This switch directs the sound to the different audio channels. In the left position, the signal or audio is fed to the audition monitor/speaker channel. The middle position is off and in the far right position the channel is sent to the program or on-air output.

Terms continued

Audition/Program. The audition channel is primarily used to set up the next sound source. On many audio boards, the audition system will have the same quality as the program channel. In order for the operator to see the VU level reading in audition the operator must turn the audition/program monitor switch to the position that indicates audition VU monitor. Likewise, for the operator to monitor or hear the program information, this switch must be in the program channel.

Master Program Switch. The master program selector switch normally has only two positions; Off and Program. If the program is to be heard by the listener, the audio must be sent to the transmitter and this switch must be in the program position.

The master program level is predetermined and set. The engineer calibrates the signal to determine what the best audio output level of the console is to the transmitter. NEVER change this preset level unless directed to do so by an engineer or your supervisor.

Operating Techniques. Operating techniques refer to the operators ability to mix, blend and control sound sources. Let's make sure we are talking the same audio language for basic audio technique. "FADING" is opening and closing the pot. "CROSSFADE" is to reduce the level of an existing sound source while increasing the level of a second sound. "SEGUE" (pronounced seg-way) is an audio transition whereby the preceding sound is faded out and the following sound faded in immediately. "DOWN and UNDER" is the fading down of music to a low level for the entrance of a voice and then holding the music source at a low level. "UP and UNDER" is the gradual increase of music to a low level while an announcement is being made, usually being followed by "UP and FULL" when the announcement is concluded. "DOWN and OUT" is fading down the music to a low level for the entrance of a voice and then taking the music completely out. Remember, avoid crossfading with music vocals where the voice will be cut in either direction. Only use down and under, and up and under, etc., when vocals are needed for emphasis.

Terms continued

Patch Panel. In a control room that has a patch panel, patch bay, or patch board, the major pieces of equipment in the studio may be connected to the preceding unit through patching. A patch panel lets the operator or engineer connect or by-pass the output of one piece of equipment to the input of another through a system of standard jacks that are attached to short lengths of shielded cable with male plugs on both ends. The process is called "patching". The by-passing is always done from the "output" of the last good piece of equipment, around the bad piece of equipment, in line to the "input" of the replacement piece of equipment. This process will allow the broadcast process to continue. These interconnecting cables are called external patch cords.

Patch cords should always be in one of two places; hung up on a storage hook; or with both plugs inserted into the patch panel. Do not leave one end of a patch cord dangling. The cord may become damaged or become the source of unwanted static or noise in the audio system. Give frayed or damaged cords to maintenance personnel for repair. Keep only well maintained cords in the studio.

BASIC AUDIO

SUBCOURSE No. DI0370

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answers on the next page. Ensure that you understand the lesson material and answers before proceeding to the next lesson.

- T F 1. In a pressure-operated microphone, the diaphragm vibrates with the pressure from the sound and makes the voice coil move back and forth in a magnetic field.
- T F 2. The omnidirectional mike accepts sound quality from only one direction.
- T F 3. The most commonly used microphone in television is the lavalier.
- T F 4. Windscreens are externally mounted on the microphones and can help eliminate loud distortion.
- T F 5. All audio control consoles are similar.
- T F 6. When patching, patch from the input to the output.
- T F 7. When the channel selector switch is in the program position, the signal will be sent to the transmitter.

BASIC SCENERY

SCENERY

Television scenery plays a major role in the quality of the visual portion of a TV program. Guidelines applicable to other visual elements also apply to scenery, especially the concepts of contrast and detail.

Today, the emphasis is on simplicity when designing scenery. Scenery created for television should be symbolic rather than too realistic. Size, texture, color and location of sets are specifically adapted to what the television camera can see. The scenic environment, though important, remains secondary. However, broadcasters should know something about the design and construction of scenery and properties.

Scenery is divided into two categories. Simply put, all scenery either stands or hangs.

Standing Scenery

The most commonly used standing scenery units are known as "flats". Flats consist of a frame and muslin or canvas covering, plus tacks, glue, nails, screws and hinges as required. Standing flats should be high enough to prevent overshooting by the camera during wide-angle long shots. The height is usually 8 to 10 feet and the width may vary from 3 to 5 feet depending upon studio requirements. Scenery constructed today is much lighter than it was several years ago. Remember to make the scenery light enough to be assembled or disassembled with a minimum of time by one person. Paper-covered sheets, and plywood, or other construction materials serve this purpose very nicely.

Flats may be single, twofold, or threefold, with different horizontal dimensions and fold for storage. Flats may contain openings for doors or windows into which these units may be fastened. Sets may require miscellaneous standing units such as pylons (which look like three-sided pillars), step blocks, pedestal, platforms, plastic bushes and a variety of folding screens. All of these special set pieces are considered as standing scenery.

Hanging Scenery

Hanging scenery is either suspended from an arrangement of pipes, battens, grids, or from some other piece of standing scenery. The most versatile hanging background unit is the cyclorama.

A cyclorama is a large curtain that hangs down from the grids in sections. They usually come in three colors white, black and chroma key blue. Usually they cover three sides of a studio.

Other hanging scenery may include painted canvas drops, curtains which may be slid or traversed horizontally, drapes, murals and sometimes photomurals. The chroma key drop is a wide roll of blue canvas that is for "keying" Keying is electronically inserted information to the side or behind the announcer. The electronic insert adds support information for the announcer. Normally, this technique is used in newscasts for slides and videotapes.

PROPERTY

Studio sets are normally built from a number of separate, prefabricated scenic units, positioned and fastened together. Subsequently, they are dressed with appropriate furnishings, properties, drapes, etc., to create the total scenic effect. There are three types of properties:

1. stage properties, or props,
2. hand props
3. set dressings.

Stage Props

There are many types of stage properties, but the term generally refers to furniture: news desks, tables, lectern, chairs, etc.

Hand Props

Hand props consist of all items that are actually handled by people during a show. They include such items as ashtrays, telephones, typewriters, dishes, silverware, glasses, bottles and food.

Set Dressings

Set dressings are furnishings that normally give an apartment or set its distinguishing characteristics of locale, mood, etc. Set dressings also include pictures, draperies, bookcases, fireplace, lamps and chandeliers, indoor plants, and miscellaneous decorative items, etc.

STUDIO BACKGROUNDS

In preparing studio backgrounds, the main problem of contrast and layout are important to consider in the overall program. Before preparing the background or scenery for a program, broadcasters need to identify camera movement, whether or not the background will be seen in a close up, and what type of action will take place in front of the background. The background, as a general rule, should be darker than the foreground. A darker area tends to recede from the viewer while a lighter area tends to stand out. This gives greater separation or depth between background and subject. Separation is a feature which is always desirable for television transmission. If the background is not to be shown in a close up, the lines and designs may be coarse. But, if one area is to be seen close up, then more detail should be added to that particular area.

Contrast

Television lighting contrast is important. Backgrounds may be adjusted by varying color, material texture, or light intensity. The most important characteristics of any particular light are direction, intensity and quality.

All three characteristics will influence the reflective value of the backdrop but in no case should the contrast range exceed the limits of the television system of 20 to 1. The brightness of color is usually measured by how much light objects reflect.

Highly reflective objects should never be included on TV as property or as part of a costume. If it is necessary to use a highly reflective surface, dull it with a special dulling spray. If dulling spray is not readily available, use soap or a solution of Epsom salts and stale beer (1 tablespoon of salt to 1 cup of stale beer). Spraying or brushing a shiny surface with this mixture will appreciably dull reflecting properties. Brasso will also dull very shiny objects. Just dab it on and let it dry.

Storage

Small station operations will be primarily concerned with non-dramatic local presentations. For this reason, the station wardrobe or costumes will be somewhere between nonexistent and very small. What there is, if anything, will probably be miscellaneous items occasionally necessary to correct clothing contrast problems.

We defined scenery at the beginning of this lesson using the terms "standing" and "hanging". In any case, if there is a lot of scenery, storage may be a problem. From the standpoint of availability, storage in the studio is best because some scenery is quite heavy. However, some scenery may require too much studio space when not in use. If so, operations personnel may have to move it into hallways or adjacent rooms or to a props and sceneries storage area. Wherever scenery is stored, it's best to have scene docks for the flats. A scene dock has slots into which the top and bottom edges of the flats slide for vertical storage like books in a bookcases. If there is no room for scene docks, scenery may have to be leaned against walls or stacked in layers. If necessary, it is best to reserve an area for each type of flat which will at least segregate singles, two folds, and three folds. Pile flats in flat horizontal layers, back to back to avoid damage. Space around the walls should be assigned specific types of flats. Drapes will be less apt to wrinkle or develop horizontal folds if they are hung on high racks. Costumes and set dressings should be stored in a prop room adjacent to the studio.

Flameproofing

Fire regulations require materials that are to be used for scenery to be flameproofed. This may be done by spraying or painting the scenery (either before or after it has been made or painted) with special FLAMEPROOFING chemicals. These chemicals are available from companies that deal in stage or scenery equipment or may be mixed at the studio from ingredients found in almost any grocery store. One formula commonly used is:

- a. 1 pound borax (sodium tetraborate)
- b. 1 pound sal ammoniac (ammonium chloride)
- c. 3 quarts water

WARNING

Although the scenery material may have been flameproofed, this does not mean that the scenery will not burn. Flameproofing only retards or slows the ignition process.

Issue Control

As with all station equipment and supplies subject to intermittent use, it is best that issue slips be completed by personnel requiring scenery or other material from storage. The issue slip should identify the material; show the length of time the material will be needed; and give the probable date of return. A suspense filing system is advisable so that the scenery and/or property custodian has information immediately available on the location and future availability of items. The custodian should establish controls for such supplies as paint, fabrics, and hardware. The reason for supply controls, other than avoiding waste, is to insure adequate inventory and sufficient lead time for planning, requesting, and purchasing.

GENERAL

The Television Graphics subcourse, part of the Broadcast Journalist 71R Skill Level I and 2 Subcourse, is designed to introduce the Army broadcaster to an entry-level understanding of Television Graphics. This subcourse is presented in one lesson.

ADMINISTRATIVE INSTRUCTIONS

SUBCOURSE CONTENT

This subcourse contains one lesson, related to the basic tasks of the entry-level broadcaster. This lesson will provide a general knowledge and understanding of television graphics.

Supplemental Requirements:

This lesson may be taken without any prerequisites.

Material Needed:

You will need paper and a pencil to complete this subcourse. No other materials are needed.

Reference Material:

No supplementary references are needed for this subcourse.

TELEVISION GRAPHICS for BROADCAST JOURNALISTS

INTRODUCTION

The television broadcaster must be able to think visually in order to make the most of the television medium. Visuals can, in some cases, tell the entire story by themselves and should be an integral part of a production instead of an afterthought. You may have heard the cliché "one picture is worth a thousand words." Well it's true, and effective visuals will help you tell the story clearer. A viewer's imagination can actually provide the "soundtrack," sometimes enhanced by narration (used sparingly) and television dialogue.

The term "visuals" may be categorized into three separate areas:

1. Graphics (maps, charts, diagrams, illustrations, printed IDs, outlines and summaries, plus character-generator information).
2. Photographic techniques (films, slides, filmstrips, and still photos).
3. Television backdrops, props, scenery and subject/talent visual information not included in the first two categories.

TECHNICAL REQUIREMENTS

Before you even plan or use any type of television graphic, you must be aware of the technical limitations and guidelines involved. Even if you do, or do not actually design or prepare the graphics, you'll need to be able to guide your artist and understand the limitations of the medium.

Therefore, it's important to understand how visuals must be tailored for television before producing or selecting them. The novice broadcaster, who doesn't understand these basic principles, may see a random visual he likes and try to use. The veteran will not rely on first impressions, but base his decision on more scientific guidelines and experience.

Any producer of television programs learns quickly that he needs a "working knowledge" of many contributory fields.

One of these is graphic art. All television shows use graphic materials--title cards, photographs, illustrations, charts and maps, just to name a few. Graphic materials greatly enhance news and feature productions, spot announcements, and virtually all types of TV programs. Keep in mind that, in television, it is important to present information visually as often as possible. Without visuals, you lose the force of this effective television medium and might as well be on radio. People tend to think visually. Generally, people remember visual information longer than Just the spoken word.

Important Characteristics

Whether written, pictorial, diagrammatic, or sheer design, graphics have a place in almost every television production. In preparing graphics for TV, you should pay close attention to the aspect ratio, size, area limitations, type of graphics, preparation techniques, methods of presentation, storing and cataloging of the visuals.

Aspect Ratio

The aspect ratio of any television screen, regardless of physical size, is 3 x 4. This means that the TV screen is divided into three units high and four units wide. The visual elements themselves should be kept in a format size that will complement either 6 x 8 or 9 x 12. These aspect ratios will help you keep the materials and objects within the 3 x 4 aspect ratio format (Figure 1-1). All graphics should be prepared within this aspect ratio. This allows all of the information to be seen on the TV screen, not just a portion of the information. For example: A vertical picture without the proper aspect ratio will lose a major portion of its information from either the top, bottom or both and/or its sides and look poor on a TV screen.

Figure 1-1
TV aspect ratio

The total area that the camera "sees" is called the "scanning area." This entire image is fully transmitted, but the outer edges and the corners usually don't appear on the home television set due to the shape of the picture tube. A properly aligned TV receiver will display all scanned information at the top and bottom center of the picture, but will crop corners due to the non-square corners of the picture tubes. Older picture tubes cropped even more at the corners and on the sides. A common mistake made by many new broadcasters is to allow too much headroom at the top of the picture. Remember, the home receiver sees everything at the top center, so don't overcompensate the same way you do for edge and corner cropping.

Essential Area

The part of the picture that reaches the viewer must include all of the important information and this is known as the "essential picture area." All visuals have a scanning area and an essential area. The scanning area is the entire picture from top to bottom and from side to side. The essential area is the main information within that picture area, the meat of that picture (Fig. 1-2).

Figure 1-2
Scanning and Essential Area

In the case of program titles or credits, for example, the essential area includes all of the title or other lettering. Every visual has a scanning area and an essential area. However, there is another area which can be as important --the "Border Area."

Border Area

Graphic artwork should have a "border" around the scanning area for several reasons:

1. It helps keep the picture from being damaged if dropped.
2. It helps protect artwork from fingerprints and smudges.
3. The border area may prevent your audience from seeing past the card to some behind-the-scenes activity if the cameraman did not have time to frame the shot properly.
4. It serves as a "bleed-off" area for overscanned sets. The excess border contains no essential information.

Size

There is no specific size of studio title cards for all television artwork or graphics. However, a generally accepted standard size for most cards is 11 x 14 inches. It's best to make all graphics the same size for storage purposes. The 11 x 14-inch size fits well in a standard file cabinet. The cards should be numbered with a piece of marking tape on the edge. Stagger these tabs for easy access. This 11 x 14-inch size has several advantages:

1. It allows an ample 2-inch handling border on which fingerprints and smudges will not damage the primary information.
2. It leaves a 9 x 12-inch working area for both the cameraman and artist.
3. It also agrees with the aspect ratio requirements of 3 x 4, but in addition this physical size incorporates a safety measure.

It's also wise to mark off an additional 10 or 15 percent inside this 9 x 12-inch area. This allows for the area that is lost due to cropping on the home television receiver (transmission loss). Thus you will wind up with a copy area of about 7 1/2 x 10-inches. This protects against

information loss at the edges of the picture (Figure 1-3).

Figure 1-3
Transmission Loss

Figure 1-4 shows the application of the same principles for a 2 x 2-inch photo slide. A small television camera (located in the film chain room) focuses on the scanned area, which measures $27/32 \times 11/18$ -inches. Approximately $1/16$ -inch on each side of the picture is lost due to transmission over the airwaves. The essential area is reduced to about $5/8 \times 7/8$ -inch. These 2 x 2-inch slides may be made with any 35mm camera, but it is best to use a single-lens reflex camera (SLR) in order to more accurately place essential material in the center of the frame.

Figures 1-4
2 x 2-inch slide

Remember to use the scanning area, because on some television sets the total scanning area is visible, while on others there is a 10-percent loss. Therefore, keep all pertinent information within the essential, or "safe", area. This is especially critical for words.

TYPES OF GRAPHICS

The types and uses of graphics are limited only by your imagination. Graphics come in various forms, each having a name that makes it easily identifiable to production and artwork personnel. The major types of television graphics include:

1. Studio card
2. Plain title card
3. Combination title card
4. Super or key card
5. Chroma key card
6. Slide
7. Maps and charts
8. Character generator
9. Computer Graphics

Studio Card

The studio card shows illustration or pictorial-type information,. The picture may be a mounted photo or an illustration. The studio card sits on an easel and may be a plain card (words only) or may have an illustration or picture with words. Combining words and illustrations requires the coordination of two video sources during a production, i.e. character generation and art.

Wallpaper "samples" are an excellent background source for studio cards. Color slides and other transparencies are usually made from studio cards. This allows for easier storage.

Plain Title Card

The plain title card has printed lettering (such as the title of the show, the name of performers, producer, etc.), with no pictorial background. Rich, deep color backgrounds with light Lettering make reading easy.

The combination title card has lettering against pictorial information for the background. The picture may be either artwork or photography. The lettering may be either on the card itself or on an overlay.

Super or Key Card

Normally you should avoid white lettering on a black background, because the contrast is too great between the two. But when making a super or key card, the lettering must be white and the background black.

During the showing of a super, or key, the card lettering is superimposed (electronically placed) over another background (or over another picture) from either another camera or from a film chain camera. This technique is an accepted form for placing the name of the subject on the air while the subject is talking. Use simple, bold letters only, and try to restrict the amount of information on the super/key card. Be careful in planning the card, you must consider how two camera shots will look in one picture. Lettering should be placed in the lower third and centered on the picture so as not to obstruct the background and/or the main action. The super is the only time you should ever use two divergent shades, i.e. off-white and/or off-black.

Chroma Key Card

The chrome key card is similar to the super card, except that the background for the lettering is usually blue instead of black, and the letters are imprinted on the card. The background of the card may be any color. However most TV production houses/TV stations use a chroma-blue background color because it makes skin tones appear natural and suppresses picture distortion.

Through electronic means, the chroma-blue background becomes totally transparent during the matting process, only showing the lettering (usually white or yellow). The camera picture from the second camera shows through without interfering with the foreground image. The chrome key matting process appears to the viewer as a rear screen projection, i.e. the picture is keyed (shown) behind an announcer or is a boxed support graphic inserted alongside the announcer. The video source may be a film chain, VTR or a live TV camera shooting a studio card.

Slides

Slides are televised from a remotely controlled projector directly into a small television camera connected to the projector. The slide is then inserted on to the screen and becomes part of the set with an announcer speaking over the slide, or it's used as still photo. Slides are most often used and preferred over studio cards since they do not tie up a studio camera and may be easily changed.

When using slides, it's important to keep all pertinent information within the essential area. The projected picture area of the slide must conform to the standard 3 x 4 television format. In other words, use only horizontal slides, not vertical slides. Ideally, all TV cards should be made into slides. This cuts down on storage space and keeps cards from becoming dog-eared through handling. However, detailed and complete artwork such as maps, logos, insignias or graphics covering common subjects should be saved for future use.

Maps/Charts

Maps and charts are also important visual aids for television programs, especially newscasts. Using simplified drawings, details should be limited to the essential areas. For example, to emphasize a whole area, such as the state of Colorado on a map of the United States, retrace the borders and then darken the state area with green or blue tints. Charts should have as little written copy as possible. Maximum clarity with minimum essentials must be your chief objective.

Character Generator

When you have a lot of printed information to get across such as names of individuals, sports scores or closing credits, the best and easiest way to do it is with a "character generator." The character generator is an electronic "graphic" system that has been used extensively in closed circuit and broadcast television for several years. The special-effects device creates letters and numbers in a variety of sizes and "fonts," or letter styles. The layout of the solid-state keyboard is similar to a typewriter or computer with the addition of several functions and operating controls. Information may be entered into the character generator from a keyboard and stored on a floppy disk or tape. Since the letters may be placed anywhere on the screen. A "cursor" (electronic location indicator) allows you to move the information anywhere on the screen (Figure 1-5).

Figure 1-5
Character generator

Some of the more advanced character generators feature 14 to 16 lines of 32 characters within the full-screen scan area, line-by-line memory recall, automatic centering, word flash, word or line underline, stand alone titling, titling over video, and two-speed roll, or crawl, through all or part of the memory. Through a colorizer, the letters may be programmed in various color arrangements. Optional features permit mass storage on floppy disk of character displays, for easiest recall at any time for a key or matte key insert. You may find the character generator to be a lifesaver as a quick means to display information, i.e., sports scores, title credits, departure times, weather information. However, it should not rule out the use of other graphic support materials available.

Computer Graphics

Computer graphics are the newest part of the technology that's available today for the television industry. Basically, the system works like this: An electronic picture is recorded on tape from a television camera, slide projector, videotape, magazine, still photo, or a studio camera. The artwork is then converted and stored in a digital code format. The computer system then converts them into electronic pictures. The computer can recall any graphic stored on the disk within seconds by random access. The graphic artist then paints/draws a picture, using an electronic pen (brush) and palette, and may add material, delete information or change the colors of the picture or letters at will and while "on-the-air". The more advanced computer graphic systems have more colors and can produce more animation.

Before this, and as stated earlier, the artwork had to be transferred into photographic slides that were filed for possible future use. Valuable time is lost changing the artwork on these slides and Just trying to locate them may be a big problem in a large television station that uses many graphics (Figure 1-6).

Figure 1-8
Computer graphics

PREPARATION TECHNIQUES

Regardless of the format or purpose of your graphic, there are a few musts, or fundamental aesthetic considerations to be made while planning. Simplicity, contrast, balance and composition are the keys to a good graphic layout.

Simplicity

The old adage "KISS" or "Keep It Short and Simple," is best when making or creating graphics. Your graphic should be easily recognizable and uncomplicated. Don't make the viewer work too hard to understand what he's seeing. People normally will ignore a visual with too much lettering. Use bold lines and lettering, and keep colors to a minimum, preferably white or yellow.

All copy or lettering must be readable. Fancy lettering may look good on paper, but might not permit the viewer to understand what you are trying to convey. After all, we don't use lettering unless it is necessary, and if it is necessary, the audience should be able to read the information. Example: Don't use Gothic fonts when reporting about Miami. However, Gothic lettering may be appropriate for a story on old Europe.

Sizing of the subject in the picture also is important. Keep the primary subject somewhat large within the picture that you are framing. Don't make the viewer have to strain to read or see the subject. A good type size may be about a half-inch in height on a 19-inch monitor.

Contrast

High definition, or contrast quality, is important for reproduction over a television system. Contrast in visuals should be sharp but not excessive. Avoid large areas of white, because such high intensity light will cause the pickup tube(s) in the camera to transmit glitter and flair, especially during camera movement, and may introduce audio noise into the video picture.

The human eye can identify about 100 different shades of gray. The TV camera clearly identifies only about ten shades. Since the brightest area can be no more than 20 times as bright as the darkest area, you'll have to be careful about using pictures and graphics that have high contrast. It should be noted that "TV white" is not really white at all. Pure white will reflect 100% of the light shone on it. TV white has a reflectance value of only about 60%. TV black is actually dark gray, reflecting about 3% of the light.

You also need to consider how color will appear on a black and white (monochrome) TV set. Color material will appear as shades of gray on a monochrome TV set, and must be used according to its gray scale value. The best way to test colors is to check them with a color TV camera and color television (monitor) that is correctly set up. You'll find that brown, purple, dark blue and black appear black on a monochrome TV; red, medium blue, and medium green appear dark gray; light blue, chartreuse, gold and orange appear light gray; pastels, bright yellow, light gray and tan appear almost white.

Even a color television system acts as a filter--it only sees a portion of the hue (color itself) and saturation (color strength) that the human eye can see. Most color cameras have trouble with the colors red and orange. Saturated colors cause excessive video noise or color stretching over the whole screen. Stripes or color banding may also show up as color vibrations, disrupting the picture. Stay with basic, solid colors, primarily blues and greens, and avoid supersaturated reds and oranges.

Studies have noted that color may influence our judgments of size, weight and temperature, and even affect our psychological state of mind. Colors are viewed as "high energy" or "low energy." Cool colors are considered low

energy; warm colors are termed "high energy". Make sure that you avoid using two colors that have the same value on the gray scale.

Balance and Composition

When designing, balance and composition are also important points to remember. For full screen graphics, make sure the design is balanced and aesthetically pleasing to the viewer. Note that certain lines and shapes have different effects on the mind. Visualize the final, on-air picture. Will it be well composed and balanced (Figure 1-7) ?

Figure 1-7
Balance and Composition

When designing chroma or mono (black and white) key graphics, be aware of the technical requirements of color, intensity and final composition. Is the position correct for the over-the-shoulder key? Seldom if ever would you use an over-the shoulder-key. Will the name or information be superimposed over the announcer's or guest's face? When using maps or charts for weather reports or special programs, keep the detail to a minimum. The viewer doesn't need to see the small towns or roads to get the message. (By the same token, some productions overdo and overuse graphics...going from one map to the next before the viewer can comprehend the information.)

Lettering

When letters are made too small or too thin, they will not be seen. A general rule of thumb is not to offer letters smaller than 15 to 20-percent of the essential area. If the visual is too "busy," or includes too much material, it will probably be distracting to the viewers. Five or six lines

of 15 to 20 characters is considered to be the most a viewer can handle at one time. This permits the use of a lettering size that is easily legible. Boldness of type also is important. Large letters are especially important for color television since the limited resolution (seeing) power of a color distribution system will not reproduce detailed artwork or small print work well. Thin lines may not appear clearly on the television screen. Irregularity of lines in a drawing are intensified when the camera shows a close-up. This also points up the need for simple fonts.

Do not use glossy inks or prints except for special effects. A glossy black, while appearing black to the eye, may pick up light reflection and transmit through the television system as a white, or near white. The television camera is sensitive to light reflections, and a smooth hard surface will reflect more light than a rough, dull surface. Another point to remember is to use only matte photographs whenever possible. The glossy prints, while appealing to the eye, usually cause problems for the camera.

There are many shortcuts for television lettering, such as the Leroy lettering pen, acetate templates, spaghetti (menu board), or paper and plastic letters that the artist may lay out and rub, or glue, onto the artwork. Transfer letters are available in hundreds of typefaces, many of which are used effectively on television. Some typewriters have oversized type, called bulletin board type, used for small visuals. Flat artwork and hand lettering may be done with opaque paint or, in some cases, with professional felt-tip pens. Almost any form of lettering device can produce a good television visual if proper contrast and layout are observed. Large colored areas generally are illustrated with colored paper or overlays. Make sure that you use a matt surface to prevent glare.

Background materials for slides may be selected from pictures in books, magazines, calendars, postcards, greeting cards, and wallpaper samples (but, be careful of copyrighted material). By printing your information on acetate (clear plastic, such as document protectors), you can then place the plastic overlay on top of the background material, and photograph both together.

When you prepare artwork for supers, or key effect, use black letters on a white card. The photographic process reverses the polarity of the artwork and allows you to use the film negative with the black background and the white letters for-your "super" slides.

Handmade letters may be made from a lettering book by making a paper copy (enlarged if necessary) and tracing the letters on the back of bright colored paper, and then cutting them out and placing them on a background. This allows more variety in color and letter styles.

METHODS OF PRESENTATION

There are many ways to present visual information in television productions, several of which we have already discussed. Other methods include:

Still Pictures

The flat or still picture was extensively used in early TV productions. They were any size according to production needs. Maps on walls or large "poster type" drawings are considered to be stills, the same as the smaller 11 x 14-inch cards. Stills were shot "live" in the studio with a TV camera using the 3 x 4 aspect ratio. Today, most stills are stored on slides, videotape or in a computer graphic system.

There are several instant cameras that use 3 1/4 x 4-inch in size, using color or black and white instant film, print and negative combinations, and transparencies. This method in the past was a popular means of acquiring fast visuals for television. Some of the instant cameras offer plastic frames for mounting transparencies. These work well on rear screen projectors, light boxes, and on flip cards that may be used during productions. Pictures may be taken of an event and shown immediately in lieu of videotape or as a support graphic, although best overall reliability is still the 35mm slide, videotape, or artwork. In addition, rear screen projection enables a variety of background settings in other types of productions.

The 8 x 10-inch transparency may be useful in small studio facilities that do not have videotape available. The 8 x 10-inch transparency can be made through a photo lab or graphic aid shop. The transparencies are shown in a device called a "light box," which needs only a low-wattage bulb and a good piece of frosted plastic or glass to diffuse the light. This same kind of transparency may be used on an overhead projector for either a frontal or rear projection screen. Either way will work for television. However, with the advent of more advanced graphic systems, these formats (rear screen projection and light box) are not used that much in television anymore, and are only mentioned here to let you know that they exist and may be used.

Drop cards

You'll find that the character generator, in large facilities, is predominantly used to support a substantial amount of lettered or numbered information. However, drop cards or flip cards are often

used as a main means of graphic support. The principle is the same as that of loose-leaf binders, except that the ring binders are mounted horizontally on a board or easel. The ring perforations are made through the bottom edge of each drop-out card, and at the top of each drop-in card. Drop-in cards seem to fall "into" the camera shot and appears on the screen. Drop-out cards appear to fall "out" of camera range, and they seem to disappear from the screen (Figure 1-8).

Figure 1-8
Drop cards

When you place cards on the stand or easel, make sure they are parallel to the camera. Otherwise, the information will look as if it is running uphill or downhill on the screen. Shooting off-axis produces "keystone" distortions, e.g. when the viewpoint is too high or shot from the side. If the lettering runs uphill (high on the right), rotate the easel clockwise.

If the lettering runs downhill (high on the left), rotate the easel counterclockwise (Figure 1-9).

Figure 1-9
Shooting graphics

Storing or cataloging visuals

It is important to be able to prepare graphic material; but equally important, you must be able to find it promptly and keep it in usable condition. You need to provide adequate storage and care for them, and you should know where they are at all times. As stated earlier, standard-size studio cards and the slightly smaller 8 x 10-inch transparencies fit well in legal-sized file folders/cabinets. Larger items will require special shelves and bins to allow them to stand upright. If the dividers of the bins are only about 6-inches square, the chance that the cards will get that "bent" look is reduced.

Regardless of your duty location, all production aids that you receive--station identification (ID) slides, weekly news service slides provided by a commercial vendor, and 8 x 10-inch prints, just to mention a few--are not accountable items. They should be retained however and filed for as long as they are serviceable. Color slides should be stored in special trays and cabinets designed for them.

No matter where your graphics are stored, keep an up-to-date index of the items. A type of cross-indexing is suggested. Slides should be filed by subject numerically, and caption index cards (also cross-referenced) should be filed alphabetically.

Graphic supports

There are several types of graphic supports. They are (Figure 1-10):

1. The caption stand (tiltable shelf, adjustable height) suitable for title cards.
2. The card pulls (tabs) are attached to edges of cards to make removal easier.
3. The title card box is used when you want to reveal the next title by pulling a card out of the box.
4. The strapeasel is used for larger graphics. Weighted webbing straps adjust to all sizes.
5. Flat displays use various graphics of different sizes.

Figure 1-10
Graphic supports

Types of graphs

A graphical presentation enables information to be assimilated and compared rapidly. Several formats are available, having greater visual interest than a routine line-graph (Figure 1-11):

1. Multisurface or strata graph
2. Column graph
3. Combined column graph
4. Bar graph
5. Sector, pie or circle chart
6. Volume chart, height chart, area chart

7. Pictogram pictorial chart
8. Pictorial symbols
9. Flow chart

Figure 1-11
Graph charts

Animated graphic-flips: (Figure 1-12)

1. Title cards in ring binders, flip into shot (drop-in); or bottom hinged flip-out (drop-out). Margin finger-grip tabs aid operation.
2. Flip-over--double-faced title-card horizontally pivoted.
3. Flip-round.
4. Rotating flip.

Figure 1-12
Flip-cards

Pull-outs (reveals): (Figure 1-13)

1. Top card is slid aside to reveal the next.
2. Black slide-out section in black card, reveals titling underneath.
3. As each black card is pulled, titling on the clear sheet beneath is revealed.
4. Slide provides push-over wipe effect.
5. Shutter slide aside to reveal new information below.
6. Breakaway, where the top graphic splits (slides apart or hinges) to reveal another.

BROADCAST JOURNALISTS**

SUBCOURSE No. DI0390

INSTRUCTIONS:

Review the material in this lesson. Answer all the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. Visuals or graphics for television are categorized into two specific areas.
- T F 2. The standard size for studio cards is 11 x 14-inch.
- T F 3. The character generator is a type of graphic system.
- T F 4. Studio cards are preferred over slides.
- T F 5. In lettering, "looking good" is the most important consideration.
- T F 6. The television camera sees less than the eye.
- T F 7. Gloss inks and prints are acceptable for special effects.
- T F 8. Drop-in cards seem to disappear from the television screen.
- T F 9. Caption index cards should be filled numerically.
- T F 10. Slides should be filled alpha-numerically.

SUBCOURSE OVERVIEW

This subcourse, containing three lessons, introduces broadcasters to an advanced level of understanding when producing radio features, conducting audience surveys and determining radio music formats.

You must have a basic knowledge of military broadcasting prior to taking this subcourse. There are no other prerequisites to this subcourse; however, it is suggested that broadcasters with limited experience complete the basic broadcaster course before taking this subcourse.

This subcourse reflects the doctrine and technology current at the time it was prepared. In your own work situation, always refer to the latest publications.

Unless otherwise stated, the masculine gender of singular pronouns is used to refer to both men and women.

TERMINAL LEARNING OBJECTIVE

ACTION:	In this subcourse you will learn how to produce radio features, conduct audience surveys and determine a radio music format.
CONDITIONS:	You are given the material presented in this lesson.
STANDARD:	To demonstrate competency of this task, you must achieve a minimum of 75 percent on the subcourse examination.

LESSON ONE

PRODUCE A RADIO FEATURE

46R Soldier's Manual Task: 214-177-2003

OVERVIEW

LESSON DESCRIPTION:

This lesson provides an overview of radio feature production.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly produce a radio feature.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's Guide, Broadcast Journalist, MOS 46R Skill Levels 1/2/3/4, August 1988.

Defense Information School Radio and Television Handbook, May 1982.

PRODUCE A RADIO FEATURE

INTRODUCTION

A feature is a program, or segment that explores, explains or demonstrates a noteworthy subject in an imaginative and colorful manner. The feature should be factual, avoiding editorial points of view. It may be similar to a documentary but is shorter and not quite as detailed. Feature programs are useful for presenting interesting but generally little-known information.

In radio you are primarily responsible for all stages of feature production. In commercial radio, particularly in smaller markets, the station's disc jockeys are also responsible for producing features. The same thing usually applies in the military. Once you are assigned a production, the whole process, from researching the subject to putting it on tape, belongs to you.

ELEMENTS OF RADIO

There are three main elements of radio you will use in the production of radio features: music, sound and voice. You must understand what they are and what purpose each of them has.

Music

Music is used to set a production's mood. It can create a feeling of excitement, tranquility, suspense or sadness.

There are basically four types of music that can be used in audio production. They are theme, background, bridge and fill.

Theme. Theme music is intended to make people associate the music with something in particular such as a character, a theme, or an idea. "Thanks for the Memories," brings Bob Hope to everyone's mind. It's his theme song. It's a good example of what theme music is intended to do. It also illustrates why you don't want to use music that has already established itself with something else. It will put the audience's mind on the other thing, and thus distract from your message.

Background. Background music is used to help set the mood of the feature and increase audience appeal. A voice-only production can be very boring, especially if it's just one voice. For example, a few strains of dramatic fanfare might heighten listener anticipation of a story climax. On the

other hand, light, melodic music could be used to support a comical subject. There is instrumental music to fit almost any mood. It's just a matter of listening to the selection, perceiving the emotion or mental image it creates and matching the appropriate mood to your subject.

When selecting music for background, instrumentals are preferred over music with vocals. Vocal songs tend to distract the listener from the message of the production. Vocal music may be used only if it contributes to the message. If vocals are used, level balance becomes critical so that the music does not override the message. Background music should be unrecognizable and match the subject. By adding the right background music, you add to the aesthetic appeal of the feature.

Bridge. The purpose of this kind of production music is to connect or "bridge" two ideas or thoughts together. Bridge music, also called "transitional music," was used in radio theater to change the scene. A short instrumental fanfare can signal a change in topics. Or, a new scene can be introduced with a short musical theme that suggests a particular location.

Fill. This type of music is often called "pad" and is usually an unrecognizable instrumental song. If your feature production is required to be a certain length, fill music can be used to eat up time at the end. This also allows the person airing the production an opportunity to gracefully transition to the next program element with less chance of lapsing into dead air.

Sound

The use of sound and sound effects works much the same way as music. Its purpose is to enhance the spoken word. Creative use of sound can help develop a vivid picture in the mind of the listener. The success of an audio production often depends on the mental picture conjured up by different sound effects.

A good example is the spot campaign produced for the Radio Ad Bureau promoting radio advertising. By using sound effects, the producer created a visual picture in the listener's mind that showed radio's versatility by doing such things as draining Lake Michigan and filling it with chocolate and then topping it off with a 750-foot mountain of whipped cream and a 10-ton maraschino cherry. This versatility is unique to radio production and is limited only by your imagination and ability to locate or create sound effects.

There are three types of sound in audio production: real, simulated and prerecorded.

Real. Real sound effects are produced in the studio using the actual source, papers shuffling, scissors, etc. The limitation is in the availability of the particular item to make the desired sound.

Simulated. Simulated sound effects are those that don't recreate reality, but merely suggest it. Crinkling cellophane can suggest a camp fire, and running your thumb across the teeth of a comb can suggest casting a fishing line.

Prerecorded. Prerecorded sound effects are those that are available on tape, record or compact disc. There are two types of prerecorded sound effects: those that create a sound picture, such as a city street or factory; and those that create individual sounds, such as footsteps, a door opening and so forth.

When using prerecorded sound effects, a broadcaster is limited to those recordings available in his station's record library. One thing most prerecorded sound effects have in common when found in record libraries is that they sound like old, much used, scratchy records. That's something the advent of the CD has taken care of. If you have prerecorded sound effects on vinyl discs, and they are old and have the scratchy sound, it will severely limit the quality of your productions. Faced with this problem, it may be to your benefit to try to record your own sounds and sound effects.

Voice

Voice is the essence of most radio productions. It's the voice that conveys the message. Each announcer interprets copy according to his style of delivery, and the type of delivery needed to effectively communicate the message. Voice characterizations may be used if it is appropriate to the production, but be very careful that the characterization is realistic and well done.

PREPRODUCTION

The preliminary steps of a feature production are usually called "preproduction" steps. As the name indicates, they are those steps taken before you actually get into the production phase of the feature.

Gather and Audition Supportive Elements

Gather all supportive elements called for in the script and audition specific music and sound effect cuts to make sure they are appropriate to the production. Of course, you'll want to be sure nothing violates the rules of SAPP (Security, Accuracy, Propriety, Policy). If music is used, it should convey a mood that enhances the production's objective. If sound effects are desired, they should support the theme of the production. If vocals occur in background music, make sure they are necessary to convey the production's objective and not distracting to the listener. Audition sound effect and production music cuts for technical merit to make sure they meet local broadcast technical standards.

Gather Supportive Actualities

Whenever possible, use actualities. You use the voices of the news makers to add credibility and interest to your news products. Why not adapt actualities for use in almost all styles of features, most notably, the news or personality feature? Remember, we as military broadcasters are more tuned toward getting the story told by those involved. The message is more important than the messenger.

Determine Length

You must determine the length and format requirements of the finished program. These will, of course, depend on the subject, and where the finished production is slotted to air. Much of the time, these will be determined for you, but you must make note of them anyway.

Schedule Rehearsal Time

Whenever you have the opportunity, rehearse. An uncontrolled event such as a fast-breaking spot news story will certainly not allow the time for rehearsal, but usually a news feature will, and you should take full advantage of it. The more you do anything, the better you'll be able to do it, and rehearsing any production will enable you to work out any difficulties as well as point out where they may pop up unexpectedly. More rehearsals in as many productions as possible add to the experience level of each crew member.

Schedule Production Time

You must be prepared for each and every step of all productions, and the time to prepare is, of course, before the fact. One place where it's easy to fall short due to lack of planning, is in production time. Always be sure that you'll have use of needed equipment, such as an edit suite, when the time comes for you to use it. Be sure that someone else doesn't have it already scheduled.

Rehearse the Script

As previously mentioned, you must take full advantage of time to rehearse. Rehearse the script. Do it aloud. Besides confirming that it meets time requirements, that is the time to find out if there are any tongue-twisters, or difficult pronunciations. If another voice is called for, make arrangements for someone to be in the production and have copies of the script prepared for that person. Make sure the announcing style is appropriate for the subject.

PRODUCTION

Assemble Required Materials

The first step in the production phase is to assemble all the required materials. Once you begin to put things together, the most distracting thing you can experience is to have to stop to get something you forgot. It interrupts your train of thought. It requires additional time that may interfere with your schedule to the point that you won't be able to complete your production on time.

Check Equipment

Make sure all the required equipment is in good working order. Although this is best done in the preproduction phase, you must repeat it as an early step in the production phase as well. Just because it worked yesterday doesn't mean that it will be fine when you need it. Like assembly of materials, you must be sure you have assembled the necessary equipment in good working order.

Prepare Tapes

In order to prevent accidental airing of unwanted material, and to make cueing easier, bulk erase any production tapes you intend to

use. And in order to keep the production operation organized, label tapes according to local procedure.

Follow the Script

Unless you wrote the script, don't make substantial changes without the approval of the author. Besides being common courtesy, there exists a chance that you'll edit something out that was necessary to the content of the script. Follow it as it was approved.

Choose Production Mixing Technique

The mixing technique you choose will depend on two things: your preference and the equipment you have available. There are several acceptable methods available to you, and you are not limited to any particular one. Although you can use any one of them, or even a combination, keep it simple.

Beginning-to-end method. This method is not recommended for beginners. It takes many rehearsals and requires much skill and experience. It is simply recording all the supportive elements of the production onto tape as required by the script, non-stop. Thus the name, beginning-to-end.

Prerecorded-voice method. As the name indicates, this calls for prerecording the voice element. As the voice element is being played back for the master recording, other supportive elements are mixed in without stopping. This production method lacks flexibility for the narrator since it is nearly impossible to match script interpretation with any music or sound effects. Of the various methods available, this is probably the least used and definitely the least recommended.

Prerecorded-music and sound-effects method. A prerecorded-music and sound-effects method simply means the music and sound-effects are prerecorded and mixed to the master recording as the announcer reads the script. In this fashion, vocal mood can be adapted to the mood created by the other elements. This seems to be the preferred method.

Segmented method. This method involves dividing up the production into smaller, more manageable segments that can be produced independently and then edited together. This would be the most recommended method for the beginning broadcaster, since you can pay more attention to each little segment and then put together the more skillfully produced parts.

No matter which method you choose, you must constantly monitor audio levels. You must be sure they are appropriately balanced. Supportive audio (background music or sound) should not override primary audio (voice). Your recording level peaks should be between 80 and 100 on the VU meter.

POST-PRODUCTION

Once you have the finished feature on tape, you should check the final product for a number of things. They are:

- o time limits
- o audio levels
- o SAPP violations
- o air quality
- o free of errors
- o dirty edits

If necessary, re-edit any portion of the production that is incorrect or unsatisfactory.

Once you have satisfactorily completed the feature and it meets all requirements, you have one final step to take. You must deliver it to the appropriate approving authority. It might not hurt to retain a master copy until you're sure the need for the feature has passed and it has accomplished its task. With bulk erasers around your station there always exists the possibility of an accidental loss, and keeping that master copy on hand could prevent a disaster.

PRODUCE A RADIO FEATURE

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. There are three types of sound used in audio production.
- T F 2. There are two basic types of music used in audio production.
- T F 3. The assembly of required materials is a preproduction step.
- T F 4. Background music is used to help set the mood of a feature.
- T F 5. The production mixing technique will depend on personal preference and equipment available.
- T F 6. The beginning-to-end method is most recommended for beginners.
- T F 7. Actualities add no credibility to a feature.
- T F 8. There are four main elements of radio.
- T F 9. A feature is a program about personalities only.

7. False (Page 5)
8. False (Page 2)
9. False (Page 2)

LESSON TWO

CONDUCT AN AUDIENCE SURVEY

46R Soldier's Manual Task: 214-177-3402

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of the conducting of an audience survey.

TERMINAL LEARNING OBJECTIVE:

ACTION: Describe procedures necessary to properly conduct an audience survey.

CONDITION: You are given the material presented in this lesson.

STANDARD: Perform all the duties described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R14-SM-TG Soldier's Manual & Trainer's Guide, Broadcast Journalist MOS 46R Skill Levels 1/2/3/4, August 1988.
Defense Information School Radio and Television Handbook, May 1982.

CONDUCT AN AUDIENCE SURVEY

INTRODUCTION

When your mission is to provide information and entertainment programming to a given audience, you must know their likes and dislikes when it comes to radio and television programming. There is only one way to accomplish that task. That is through an audience survey. Although there's no rule requiring an audience survey with any predetermined regularity, any station that wants to be responsive to its audience's wants and needs will conduct a survey to find what those wants and needs are.

This lesson examines the basic elements of a survey and the different types of surveys. It constructs a survey questionnaire and discusses how questions are developed. And it explains techniques for managing a mail survey and analyzing survey results.

SURVEY EXPECTATIONS

As a rule, audience surveys are a mystery to the uninitiated and a headache to broadcast journalists who have to conduct and analyze them. But if surveys are conducted properly, everyone associated with the station will know how well they are serving their total audience.

What can you expect from an audience survey? Suppose the station commander would like to know how many people watch the six o'clock news. Would you conduct a survey to find that out? That in itself is not enough reason to conduct a survey, but the commander should try to obtain as much information about the station's viewing or listening audience as he can.

An audience survey can provide valuable information in five main areas. They are:

- o determine the approximate size of the "potential" or "available" audience.
- o define the viewing or listening habits of the audience.
- o identify program or personnel changes that might improve your programming.
- o identify the demographics of your "typical" viewer or listener.
- o demonstrate the station's public image as a provider of information and entertainment.

ELEMENTS OF A SURVEY

There are two main elements of a survey: the problem and the population.

The problem is the big question or questions that you need answers for, and the population is the group from which you select people to give you those answers.

Let's go back to the original supposition that the commander wants to know how many people watch the six o'clock news. When putting this problem before the audience, the commander could indicate the purpose for the survey as "obtaining information concerning the listening or viewing habits and program preferences of our audience." The audience can then respond to a variety of questions. At the same time, the survey provides needed information for the station commander by also responding to specific questions concerning the six o'clock news.

SURVEY STEPS

Once you know the big question and have some ideas for other questions, you must follow a guideline to put your ideas into survey form. There are 10 basic steps in conducting an audience survey.

- o HYPOTHESIS: State the problem or state what you want to measure. Keep the wording to a minimum.
- o PLAN: Decide on procedures, type of survey, material and personnel.
- o SUPPORT: Get command approval to survey assigned personnel.
- o CONSTRUCT: Draft the questions and design the questionnaire format.
- o PRETEST: Administer the questionnaire in draft form to a small group to see if it yields useful responses. This step allows the surveyor to deal with problems of question wording, answer choices and interviewer procedures.
- o SAMPLE: Choose which people to survey.
- o PRINT: Incorporate any changes to the questionnaire which may have resulted from your pretest efforts. Duplicate the questionnaire in desired quantity.
- o COLLECT: Distribute the questionnaires/conduct interviews and gather the data.

- o TABULATE: Score the completed questionnaires then analyze and interpret the data.
- o REPORT: Report the survey results.

SURVEY TYPES

Whenever the word "survey" is mentioned, many people think of someone going door-to-door with a clipboard, asking questions. Although that is one way to conduct a survey, it is usually not very practical. In the military, the audience is normally spread out over a fairly large geographical area. We must keep that in mind when discussing the three types of surveys: telephone, personal or face-to-face, and mail.

Telephone

A telephone survey is often the first choice. There are several reasons why that method would appear to be attractive. A telephone survey:

- o is more economical than other types of surveys unless your survey would require many long distance calls.
- o simplifies the selection of the survey participants and there is less chance of bias.
- o is relatively easy and can be conducted from an office or home.
- o is the fastest way to administer the questions and obtain the necessary feedback.

There are also disadvantages to the telephone survey. It:

- o has to be short, and that might limit the amount of needed information you can obtain.
- o makes it necessary to train the people you will use to conduct the interviews, which requires extra time, and you can't always monitor the conduct of the interviewer.
- o limits the types of questions that can be asked and there is greater suspicion of questions involving personal matters.
- o makes it impossible to use exhibits such as lists of alternative answers which afford the survey participant a better chance to express his knowledge or opinion about the subject.

- o excludes anyone without a telephone. Surveying soldiers whose day-to-day activities place them in a field environment would surely be difficult to reach.

Personal

In the personal or face-to-face interview survey approach, the interviewer visits with the respondents at their homes or places of work. Some of these surveys are conducted on the street or in some public place such as a PX mall or commissary. As previously mentioned, these are usually impractical in the military, but they do have several advantages. Personal or face-to-face interviews:

- o offer the greatest flexibility in questioning methods and visuals can be used for aided recall or multiple-choice questions.
- o can be in-depth, thus providing a great deal of information from a single respondent.
- o allow better selection of participants so that it is truly representative of the entire survey population.
- o permits selection of participants to be more focused in its coverage when the need is to survey a specific area or specific segment of the population.

In addition to the previously mentioned difficulty with a population that is spread out over a large geographical area, as is often the case in the military, there are other disadvantages to the personal or face-to-face interview survey. Personal or face-to-face interviews:

- o may cost more than other survey methods, and you must weigh the cost against the amount of information obtained.
- o require more expertise in interviewing, more effort and persistence canvassing the population needed.
- o make selection of participants more exacting and time consuming.
- o are difficult to arrange because of duty requirements of the interviewer and the interviewee.

Mail

The most often used survey method in the military is the mail survey. This type of survey has some unique advantages. Mail surveys:

- o are easy to handle because they require no interviewer training or monitoring.
- o are without interviewer bias when the questions are properly written and evaluated.
- o generally cost less although cost can be deceptive because low response rates of return may require many questionnaires to be mailed.
- o make selection of participants easy since prepared mailing lists can be used.
- o allow for wide geographic coverage which makes the mail survey very attractive to station commanders.
- o offer the opportunity for more candid replies to questions which may be embarrassing to answer in a telephonic or personal interview.

Mail surveys also have some disadvantages, in that they:

- o limit selection of participants to the available mailing lists (letters can be addressed to "occupant" or "resident," but these usually leave a negative impression with the respondent).
- o usually have a low response rate, which may skew the results (those who don't respond could be much different than those who do, and when the non-respondents make up 50 to 70 percent of the audience, distortion can be serious).
- o require questionnaire length to be held to a minimum, usually no more than two pages.
- o use relatively simple questions, thus eliminating the opportunity to probe for meaningful replies. There is no way to prevent replies from being influenced by subsequent questions, since the respondent can read ahead before replying.
- o prevent knowing if the selected participant was actually the person who completed the questionnaire.
- o takes longer to conduct.

There are no hard and fast rules to tell you which survey method should be used. You must weigh the circumstances which are peculiar to your station and situation before deciding. In the military, you will most often use the mail survey.

Focus Group Interviews

An alternative to conducting a mail survey is the focus group interview. Focus group interviews are structured group discussions in which representative members of the audience are brought together to discuss one or more command information products or issues.

The respondents (usually 15-20 people) are selected randomly in the same manner as in a longer formal sampling. Basically, the procedure involves five steps.

Selection. As usual, local military personnel offices are used to identify respondents on a random basis. In order to make sure there is an adequate breakdown by rank and age, 20 to 30 names should be drawn. The end result would be a panel consisting of no more than 20 people.

Format. The key to effective group interviews is planning. Focus group leaders must determine the special objectives of the session (i.e., what is to be surveyed, what specific questions will be asked). Respondents should be told in advance the purpose of the group survey.

During the interview, the panel is led through the different subject matter categories. Three hours should be enough time to conduct the interview. At least three additional people should be present to record the responses.

Content. Content is the interviewer's primary responsibility. Subject matter should be allowed to drift somewhat with the normal flow of the group's interaction. However, there should be some boundaries established. When these limits are reached, the interviewer should redirect the discussion by simply providing transitions from one subject area to another.

Recording/coding responses. In addition to the written observations of the three recorders, it may be useful to tape the entire interview.

In making notes on the reactions of various respondents to particular issues, interviewers must pay close attention to non-verbal cues as well as looking for depth of feeling. These areas do not come across as well on a tape recording. However, after the interview, the interviewers (recorders) go through each point covered during the interview and try to reach a consensus on what was expressed by the group. If there is difficulty, the audio tape is used or other people may be consulted.

Using the data. Often, it will be necessary to hold more than one focus group session to obtain information needed to evaluate a

particular command information program or product. In view of this, it would be unwise to jump to any conclusions based on the results of one interview.

If a point comes across strongly and suggests that a change is called for, more questioning should be carried out before decisions are made. Before a decision is made to change some existing policy or format, it should be tested on a certain audience or a representative segment of that audience. After gradual implementation, negative response can be picked up immediately.

The value of information gained by using this method increases as the process is repeated. If a finding holds up throughout a series of these interviews, and throughout the audience, it could be looked at as being statistically valid.

CONSTRUCTING A QUESTIONNAIRE

Putting together a questionnaire can be a lot like putting together a puzzle. Once you get started in the right direction, the rest of the pieces fall into place.

There are basically two types of questionnaires, sometimes called survey schedules:

- o self-administered
- o interview-administered

Just as the names indicate, the respondent fills out his own on the self-administered one and on the interview-administered one, someone else does it. The main difference in the two is that with the self-administered one there must be directions for the respondent to follow.

MAKE IT EASY

If there is one specific rule common to all surveys, it's to make it easy for everyone involved. Thinking ahead, you should ask yourself questions like: Who will answer these questions? How will the responses be recorded? What do we really want to find out? Use this information to construct your questionnaire and to formulate the questions.

Most questionnaires are printed on standard sized paper or on 5" x 7" answer choice cards. It's always good to print about one-third more questionnaires than you'll need. The overage can be used for training interviewers, providing sample copies, spoilage and lost copies.

MAIN PARTS TO A QUESTIONNAIRE

Generally there are three main parts to a questionnaire, each designed to acquire a specific type of information: identifying information at the beginning, questions about the survey's subject in the middle and questions which ask for demographic information about the respondent at the end.

The identifying information usually includes the name or title of the survey. It allows the respondent to quickly identify what the survey is about. This is usually followed by a statement of the general purpose of the survey and the confidential nature of the responses.

You may also find the address of the sponsoring agency, the date completed and the questionnaire number in this first part or on a cover letter, if there is one. The address of the sponsoring agency allows the respondent a chance to refer to the station for results. The date is necessary to determine if there were any significant events that might have occurred which may have influenced responses. The survey number is useful in sorting questionnaires, sequencing the collected data and distinguishing data from different areas.

TYPES OF QUESTIONS

The most difficult and important part of the survey is developing the questions. Extracting factual information is much easier than getting a true measure of opinions. You have several choices as to the kinds of questions for finding out how much someone knows about a subject. Each has certain advantages and disadvantages.

Open-End

Open-end questions allow the respondent to answer questions in his own words. While giving the respondent a maximum opportunity to express his viewpoint, you are confronted by the problem of trying to categorize the responses from many people. This takes more time and increases the chance for error when recording the answer. Sometimes people don't remember or know how to correctly express certain facts.

Checklist or Multiple Choice

These questions give the respondent a selection of possible answers. All he needs to do is select one or more, depending upon the question. The biggest advantage here is that the respondent can be reminded of possible answers he might have otherwise overlooked. In most cases it is wise to have an "other" category where the respondent can indicate a choice not given in the list. This is particularly helpful in pretesting possible answer choices

to determine if any have been left out. A large percentage of "other" responses would indicate this.

Dichotomous (divided into two parts)

Dichotomous questions are questions of the "yes/no" or the "true/false" types. With these, you should also use "not sure" or "don't know" so the respondent is not forced into a decision if he is uncertain. Often this type of question is used as a qualifier. If the person answers "correctly," he is then asked to answer other questions about that particular subject. For example, you wouldn't expect answers about the presentation of the news if the respondent indicated that he didn't watch or listen to it.

Rank-Ordered Questions

Sometimes it is useful to have people indicate some kind of preference or perceived importance for the items. The respondent is given a list of items and asked to assign a rank (1, 2, 3, etc.) to them. This would be useful in ranking audience preference for different types of radio music shows or TV programs.

Agree-Disagree

Measuring opinions can be accomplished by using different types of questions or statements. The agree-disagree approach asks the respondent to indicate whether he agrees, disagrees or has no opinion with regard to the statement. Here, too, you need a "don't know" category.

Opinion Scales

These are usually three, five, or seven point scales that can be used to measure the intensity of feeling about a subject. For example, you might ask the respondent to indicate how important he feels various sources of news are to him. Each source could be rated as follows:

DI0430 20

- o very important
- o somewhat important
- o so-so
- o somewhat unimportant
- o not important

The scale would be listed at the beginning of the section, followed by questions asking the relative importance of each listed source of news. Sometimes you may wish to condense such questions into a three-point scale such as, important, so-so, and unimportant.

Most of the time you will find it necessary to use several different types of questions to obtain the needed information. However, there are some basic things to remember about the wording of all questions.

WRITING THE QUESTIONS

Questions should always be as concise as possible...the shorter, the better. Simple words that are familiar to the respondent will help you achieve this. Any technical wording or jargon should be avoided, replaced or explained. The questions should generate exactly the information desired and in terms that would assist tabulation and statistical analysis. A common error often made is that of overlapping categories. A prime example of this is when a person is asked to check his age category and is confronted with choices like: 18-20, 20-22, 22-24. Which age group would you choose if you were 22 years old? Also, how would we know how many in the 20-22 age group actually belonged in the 22-24 group?

Another problem area is that of multiple-meaning questions that are confusing to the respondent and deny the surveyor a chance to clearly interpret the responses. An example of this would be: "Which medium is best for news and entertainment?" The question should limit itself to news or entertainment, not both.

Leading questions are those that are worded in such a manner as to suggest an answer. "Would you say that you are in favor of more radio news?" is leading. "How would you evaluate the amount of radio news now offered by XYZ radio?" is not leading. Don't ask leading questions.

Catchwords or words with emotional connotations should be avoided. Words such as "conservative," "liberal," "feminist," etc. elicit strong feelings that influence how a person will respond.

When feasible it is sometimes good to use check questions. These are two questions worded differently, placed in different parts of the survey that bring out the same fact or opinion. They are used to bring out the internal consistency of the responses. "What is your favorite FM show?" and "Do you listen to FM radio broadcasts?" would serve that purpose.

QUESTION ORDER

The order of the questions is very important. They should be arranged in a logical manner that will avoid confusion and misunderstanding. Things to remember when arranging your questions:

- o Keep the knowledge and opinion questions separate.
- o Keep questions dealing with similar subjects together.
- o Specific questions should come before any general questions if both types are used.
- o Opening questions should be easily answered. They should be interesting and make the respondent want to cooperate.
- o Questions that might embarrass the individual should be at the middle or end of the questionnaire. Sensitive questions should be grouped with less-probing ones.
- o Demographic questions are placed at the end of the questionnaire. The demographic section asks the respondent to describe himself. Naturally, most respondents consider these questions .very personal. The respondent is more likely to answer demographic questions after he is asked for his knowledge about the subject. Responses to these questions are useful when cross-tabulated with questions describing the different kinds of people that either know something or hold a particular point of view. Most military surveys include age, sex, education, military area, rank, years of service and component in this section.
- o Leave a space at the end of the questionnaire for the respondent to give his personal feelings about the survey subject or survey itself. This is another way of letting the respondent know that his information and opinions are important to those who are conducting the survey. And, of course, it is always good policy to thank the respondent after cooperating.

PRETESTING QUESTIONS

Questionnaires should always be pretested on a small group of the intended population. Pretesting is nothing more than a trial run. Pretesting allows you a chance to deal with problems concerning question wording, answer choices and interview procedures.

Talking with the pretest group will also point up additional possible questions and problem areas.

Finally, one should always consider the possibility of repeating the survey. Questions that have been thoroughly pretested and have worked in the actual survey can be used to measure the same thing with another group, or at a different time. Comparison of audience data collected at different times is often useful in determining changes in perception and/or presentation. If a large segment of the audience indicated they enjoyed the news in one survey and then in a subsequent survey indicated they no longer watch the news, a change in presentation of news might be in order.

SAMPLING

Earlier, we discussed the 10 basic steps in conducting an audience survey. One of those steps, sample, requires closer scrutiny. As defined, sample means "to choose which people to survey." Let's say that our total viewing audience numbers 4,000.

This number includes assigned military and civilian personnel and their family members. This is the population we wish to sample.

SAMPLE METHOD

There are five sampling methods available to the surveyor.

- o simple random
- o stratified random
- o cluster
- o systematic
- o quota

Simple Random

Simple random sampling means that everyone in the population has an equal chance of being included in the sample. This can be done by assigning a number to each person in your audience. Their numbers are written on separate pieces of paper and placed in a box. The slips are drawn until enough people have been selected to make the survey valid (see Sample Size later in the lesson for how many numbers should be drawn). To ensure everyone has an equal chance, each slip is placed back in the box after being drawn. If any of the same slips are drawn again, they are ignored and placed back in the box.

Stratified Random

Stratified random sampling means that before a random sample is drawn, the population is first divided into different groupings (strata) of a single category such as age, sex, rank or education. For an audience survey in which the primary concern is how much of the total population listens to the six o'clock news, this type of sampling would be impractical. But, if we wanted to know how many privates, corporals, sergeants, first lieutenants, etc. were catching the six o'clock news, we would have to use this method.

Cluster

Cluster sampling means that you pick your 350 people in groups. For example, we might select 35 people by the simple random method from each of 10 housing areas also randomly selected from all of the housing areas.

Systematic

Systematic sampling, sometimes called "patterned sampling," proves to be a very convenient method for sampling military personnel. Here, we follow a definite pattern in choosing sample subjects from some population list of names.

For example, we have determined that we need a minimum of 400 people to serve as our sample. One way to make this selection is to draw a random number out of a hat. From a given list or roster we would then select the first 400 individuals with that number in the last four digits of their social security numbers.

Quota

This is the fastest and cheapest method of sampling, but the least reliable. To obtain our sample, we might tell 10 interviewers to get responses from 35 people in our listening or viewing audience. Who gets selected for the sample is then left up to the interviewers.

SAMPLE SIZE

In determining sample size we are concerned with two things: accuracy (reliability) and confidence (risk). Other factors such as method of collecting data, interviewer bias, and question structure can also influence the reliability of our results.

When we take a random sample, we are taking a carefully selected part to show the characteristics of the whole population. There will always be some error such as the difference between the estimate provided by the sample and the percent of the whole population. However, random sampling allows us to specify ahead of time the amount of this error and the confidence we have that the amount will not be exceeded. In conducting a survey of the military audience, simple random sampling is recommended.

The sample size can be determined from the following table which is indexed by the size of the total population (audience) and the desired confidence level. A confidence level of 95 means that if the survey was conducted 100 times using the listed population sizes, the results would be the same in at least 95 surveys. The most common interval of accuracy is plus or minus 5 percent. That means any survey results projected for the whole population may actually be either 5 percent higher or lower than what the sample indicated during the survey.

SAMPLE SIZES NEEDED FOR DIFFERENT LEVELS OF RELIABILITY (95% Confidence Limits)				
Population Size	$\pm 2\%$	$\pm 3\%$	$\pm 4\%$	$\pm 5\%$
100	96	92	86	80
250	226	203	177	151
500	414	341	273	217
1000	706	516	375	278
2000	1110	696	462	322
3000	1334	787	500	341
4000	1500	842	522	350
5000	1622	879	536	357

Table 1

For a listening or viewing audience of 4,000 and an error or accuracy tolerance of plus or minus 5 percent with 95 percent confidence limits, we need to randomly select 350 people to complete the questionnaire.

Let's say we decide to use a mail survey to determine how many in our audience watch the six o'clock news. From the table we know that we need to completed questionnaires from 350 people. Does this mean that we need to only send out 350 questionnaires? No, but we need to ensure that we receive at least that number of questionnaires back.

The typical response rate to mail surveys ranges from 30 to 35 percent. Plan for follow-up mailing, perhaps post cards. We will need to send out a questionnaire to at least three times as many questionnaire as we need to get back.

A cover letter from the Commander, Chief of Staff or some other authority will help boost return rates.

Using all of the data that we have discussed so far, let's say that we mailed out our 1,050 questionnaires. We now have back 350 completed questionnaires.

ANALYZING THE RESULTS

The last, and perhaps the most involved step to completing an audience readership survey, is analyzing the results.

Completed questionnaires must be analyzed to provide, at the least, percentages to survey question responses.

Audience survey results can supply a great deal of useful information besides percentages and audience demographics. If they are properly analyzed and interpreted, your completed results can also reveal problem areas with:

- o distribution effectiveness
- o audience awareness and acceptance
- o audience opinion about the value and effectiveness of the station

To go one step further, your findings could ultimately be used as a learning tool. Survey results can provide a sound basis from which to make decisions on such matters as how to reach specific audience segments with specific messages, or determining which areas of coverage concentration could be reduced without losing segments of that audience.

WHERE TO GO

A major problem most public affairs offices face is they normally don't have the resources to generate this kind of information --in terms of both cost and manpower.

With knowledge of statistics, certain tests can be performed quickly to yield descriptive data. Others can do even more, but they are so complicated that it can be very time consuming.

Computers can perform all of these tasks and more in seconds. In most cases computer support is available through local Directorate of Information Management offices (DOIM). Computer support can also be obtained from:

- o the area comptroller
- o nearby universities
- o personal computer user groups

If a check with these sources fails to locate the appropriate facilities, data analysis can still be done, as a last resort, "by hand." Survey analysis done in this manner won't, however, provide detailed statistical data. But this method will, at a minimum, give some insight of your audience's readership trends.

INTERPRETING THE FEEDBACK

When using computer support, the first obstacle to overcome is the language barrier. You should know at least what to ask for before bringing your data to the computer. It must also be presented in a format the computer will understand.

As a minimum, the interpretation should show frequency and crosstab tables.

FREQUENCIES

The staff of our post station, WDIS, recently completed an audience survey. A 24-item questionnaire was used to query a sample selection of 465 respondents.

Initially a frequencies analysis was performed to obtain overall results on each questionnaire item. These are some examples of the kinds of information this procedure provided:

Sample	Absolute Frequency (actual number)	Relative Frequency (percent of total)
Active Army	406	87.3%
Others	59	12.7%
Total	465	100.0%

Table 2

Table 2 gives the overall total of Active Army personnel (406) and others (59), and the percentage which they comprise in the total sample (87.3 and 12.7 respectively).

	Absolute Frequency	Relative Frequency	Cumulative Frequency
E1-E4	148	31.8%	31.8%
E5-E7	150	32.3%	64.1%
E8-E9	26	5.6%	69.7%
W1-W2	10	2.2%	71.9%
W3-W4	7	1.5%	73.4%
01-03	45	9.7%	83.1%
04-06	18	3.9%	87.0%
07-	2	0.4%	87.4%
GS1-GS5	13	2.8%	90.2%
GS6-GS11	17	3.7%	93.9%
Other	29	6.1%	100.0%

Table 3

Table 3 illustrates the by-rank breakdown of the sample used. Ideally, these figures will be roughly proportional to the normal rank breakdown found in the post population. The cumulative frequency provides a running percentage total.

CROSSTABS

Frequencies alone do not provide enough specific information to make abrupt changes in coverage. More data is needed before decisions can be made on how or whether to implement any changes. The second statistical procedure used on the sample survey was a crosstabs analysis. This test provides specific information about how each sub-group feels about each question. Table 4 illustrate crosstab findings:

How much do you believe of what you hear on WDIS (Absolute frequency/relative frequency by row)						
	All	Most	About Half	Less than Half	None	
E1-E4	14/10.1	76/ 54.7	32/23.0	13/ 9.4	4/2.9	
E5-E7	18/12.4	91/ 62.8	25/17.2	9/ 6.2	2/1.4	
E8-E9	3/12.4	18/ 72.0	2/ 8.0	2/ 8.0	0/0.0	
W1-W2	0/ 0.0	5/ 50.0	3/30.0	1/10.0	1/10	
W3-W4	0/ 0.0	4/ 57.1	2/28.6	1/14.3	0/0.0	
01-03	3/ 6.7	33/ 73.3	7/15.6	2/ 4.4	0/0.0	
04-06	1/ 5.9	13/ 76.5	3/17.6	0/ 0.0	0/0.0	
07-	0/ 0.0	2/100.0	0/ 0.0	0/ 0.0	0/0.0	
GS1-GS5	5/41.7	4/ 33.3	2/16.7	1/ 8.3	0/0.0	
GS6-GS11	1/ 6.3	12/ 75.0	3/18.8	0/ 0.0	0/0.0	
Other	0/ 0.0	3/100.0	0/ 0.0	0/ 0.0	0/0.0	

Note: Not all respondents answered the question.

Table 4

To maximize its usefulness, data should be subjected to three stages of analysis:

- o preliminary analysis --data is broken into basic groups and "raw data" tables.
- o aggregate analysis --responses are broken down into percentage and specific groups for study (by sex, age, etc.).
- o comparative analysis (the heart of the survey) --all data is matched against other statistics and conclusions are drawn based upon the results.

CONDUCT AN AUDIENCE SURVEY

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. An audience survey is an annual requirement as prescribed in AR 600-35.
- T F 2. The three types of surveys generally considered in the military are census, annual and mail.
- T F 3. The sampling methods available to the surveyor are simple random, stratified random, cluster, systematic and quota.
- T F 4. Simple random sampling means that everyone in the population has an equal chance of being selected.
- T F 5. The two main elements of an audience survey are sampling and percentages.
- T F 6. The most commonly used error or accuracy tolerance is plus or minus 5 percent.
- T F 7. If your station decides to use a mail survey, you would expect a response rate of 30 to 35 percent.
- T F 8. In determining sample size, the two factors you're concerned with are access and confidence.

LESSON THREE

DETERMINE A RADIO MUSIC FORMAT

46R Soldier's Manual Task: 214-177-3406

OVERVIEW

LESSON DESCRIPTION:

This lesson will provide you an overview of how to determine a radio music format.

TERMINAL LEARNING OBJECTIVE:

ACTION:	Describe procedures necessary to properly determine a radio music format.
CONDITION:	You are given the material presented in this lesson.
STANDARD:	Perform all the duties described in this lesson.
REFERENCES:	The material contained in this lesson was derived from the following publications: STP 46-46R14-SM-TG Soldier's Manual & Trainer's Guide, Broadcast Journalist MOS 46R Skill Levels 1/2/3/4, August 1988. Defense Information School Radio and Television Handbook, May 1982.

DETERMINE A RADIO MUSIC FORMAT

INTRODUCTION

Of all the responsibilities of a broadcast manager, there is perhaps none that will impact upon the accomplishment of his primary mission as much as establishing the radio music format. Let's face it, your audience won't tune in for the routine command information spots you air unless you offer music to fit their tastes. There have been times when people liked a commercial so much that they would intentionally listen to it, but such cases are rare at best. After all, it's the seller who wants the listener to hear his message, not the other way around.

It's your job as broadcast manager to attract your audience's attention in order that you can deliver the command information. The mission is to inform and entertain. Never forget that "inform" comes first. The "entertain" is more to enable you to inform than any other reason. Of course, entertainment promotes good morale, but it's necessary for the broadcast manager to understand the priorities.

DETERMINE THE OBJECTIVE

Although the normal objective of a music program format is to deliver the maximum command information with the minimum annoyance to the music-listening audience, there are special circumstances where the objective could be somewhat different. In any case, understanding the objective is step one.

CONSULT AUDIENCE SURVEYS

Once you've determined the objective you can plan your steps. One part of the equation is always the audience. In order to inform and entertain an audience, you must know its likes and dislikes. That is the function of an audience survey.

As you learned in lesson two of this subcourse, audience surveys go to great lengths to ascertain the things you'll need to know about your audience. Once you know them it's a matter of appealing to their tastes. There are a number of things you must do in order to accomplish that.

DETERMINE MUSIC

Appealing to an audience's tastes may not be a simple thing. If the audience was one person, or many people of exactly the same taste, it would be easy, but that is never the case. The military is a miniature of the entire country as far as population and its tastes, although sometimes concentrations do exist. How do you appeal to everyone? You don't! The best you can hope to do is appeal to the largest segment of your audience most of the time and have something for everyone in proportion. Simply put, that means if 80 percent of your audience likes rock "n" roll, 10 percent likes country and 10 percent likes soul, you would play 80 percent rock "n" roll, 10 percent country and 10 percent soul. That may be an extremely simple example, but the basic theory is valid. Many things must be considered in determining what music you play, how often you play it and at what time of the day. There are also a few things you should take care to avoid in the selection of music.

They will be discussed later in this section.

Prevent DJ preference

There will be many facets to address in analyzing audiences. Once you've waded through all the different points to consider and come upon the correct makeup of your audience, manager and broadcaster alike must pay special attention to being objective and maintaining a professional approach to the construction of a play list. After that play list has been decided upon, you'll still need to provide guidance to the DJ. Most stations prepare a music wheel or hot clock, representing an hour of local show time, as a guide for local disc jockeys (see Figure 1, Radio Hot Clock). A circle corresponding with the face of a clock is used to show the DJ required, or suggested, show element to air and the approximate time to air it according to local SOP. It can refer to music selections, spots and jingles/propellants.

FIGURE 1. RADIO HOT CLOCK

You'll probably leave selection of specific songs to the show announcer, but within some rather strict guidelines. Music types can be administratively divided into classifications for simple management of the format. Usual classifications are "hot" chart songs, "low" chart songs and oldies. Songs can be further classified by tempo or gender of artist, as desired.

Prevent Overplaying Of Chart Music

If ever there could be too much of a good thing, it could be in popular music. There is a fine line between too little and too much, with **just enough**, balanced on it. In deciding how much to play any given piece of music, you must also consider any canned shows that are aired over your station. Example: If you air The Charlie Tuna Show, you must count the times he plays a certain song as well as the times you play it.

You'll want to have some system for keeping track of how often a selection is aired. File cards can be prepared for the top chart songs that can be rotated when one of the songs is played. It is also necessary to mix up the times of airing as well. Table 5 is an example that could serve to keep track of both how often and at what time of day the songs on your play list come up.

The following table is for a three-hour show, with each initial representing a half-hour segment of the show. A is the first half hour, B the second half hour, etc. If you have both morning and afternoon shows, you'll want to keep one for each show. Keep one for each playlist of songs if you divide your songs up by separate lists, such as A for hot 100, C for recurrents, B for oldies, etc.

POS.	TITLE	MON	TUE	WED	THR	FRI
1.	Number 1 song	A	D	F	E	C
2.	Number 2 song	F	A	E	C	D
3.	Number 3 song	A	F	D	C	E
4.	Number 4 song	B	C	A	D	F
5.	Number 5 song	C	B	E	F	A
6.	Number 6 song	E	D	B	A	C
7.	Number 7 song	D	E	C	B	A

Table 5

Ensure Proper Balance

Music types can be administratively divided into classifications for simple management of the format. As previously mentioned, the classifications would be "hot" chart songs, "low" chart songs and "oldies." Songs can be further classified by tempo or gender of artist, as desired.

Songs should be listed by classification on the music wheel in the position determined to best fit the format objective.

You may determine a need to vary the female-male-group balance of your announcers' playlists. Requiring a loose mix of three will prevent an "all male" or "all female" sound from dominating your local shows.

In order to keep the listener's interest, another thing you must balance is tempo. A widely recognized and effective way to do this is with the "wave" effect. That means to program an up-tempo song to start, slow the tempo through the middle of the first half-hour, start the second half-hour up-tempo again, slow through the middle of the second half-hour again, and end with an up-tempo song.

DETERMINE SPOT-TO-MUSIC RATIO

Every year billions of dollars are spent in the advertising business in an effort to get the sponsor's message to an audience. Probably the single most prominent goal is to get the audience to listen to the commercial instead of heading for the kitchen during the commercial break. That should lead us to understand that the audience is there for the entertainment portion of the program. They will put up with some commercial announcements (which is, after all, what spots really are), but when the commercial/spot to entertainment ratio gets too out of balance, the audience will go away. It is therefore extremely important to maintain the correct spot-to-music ratio. If you have no audience, it doesn't matter how good the spots are or how many of them you air, or how much command information you put out.

There is no hard and fast formula for proper balance. Your best tool in determining how good a job your station does in this regard will be in audience surveys. Your local survey will provide feedback that indicates how well balanced your format is. In the event you don't already have a format balance established, a good place to start is six minutes of music to each minute of spots. Of course, you adjust from there according to the feedback received in audience surveys.

SPOT CLUSTERS

Most stations will cluster spots together rather than sandwich them between songs. This method will give a "more music" sound. A spot cluster or spot set of two or three spots every 10 to 12 minutes on the music wheel is not uncommon.

The spot cluster can be made up of a combination of produced (carted) spots and reader (live) announcements, depending on the command information emphasis. Your Command Information Section Traffic and Continuity can assist you in this.

SUPPORTIVE MATERIALS

Your music program format should also indicate how often and when supportive material is aired. Supportive materials include jingles/propellants, news or sports features, comedy segments, weather and things of that nature.

It's necessary to provide guidance to the program announcer as to how often and when to use produced jingles and music propellants so that they don't become a crutch. Here again, there is no set rule that tells you what is too much. It's up to you to decide and see to it that they are not overused. The key is to balance the program aid with other show elements.

You should also establish guidelines concerning announcer self-identification, whether the ID is formal or informal. Again, balance is the key consideration.

It's important that your audience understand when it can expect certain show elements. Different time periods will have different emphasis because the nature of the audience changes with the daypart. For example, information such as news, time hacks, weather, temperature, road conditions, and school closings are more important to most "morning drive time" audiences, while features may appeal more to the midmorning local audience. Afternoon drive time audiences might prefer information segments during the local music show such as sports, weather, time, etc. To be more specific and exact, you'll need the information provided by your audience surveys.

If you're an affiliate station, you must also consider your network's music program format. How far you can deviate from the network's sound will most likely be dictated by the network, in accordance with your local audience needs and wants. In any case, your audience will expect a certain amount of continuity.

Remember that your audience has a lot of input to your radio music format, but you also have a command information mission. The radio music format you determine will impact heavily upon that mission. You will need to submit your format to your supervisor for approval unless local SOP gives you approval authority.

Finally, remember that audiences change, both in make-up and tastes. Especially in the military where people are constantly on the move, your audience is subject to turn over completely in three years.

DETERMINE A RADIO MUSIC FORMAT

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The "wave" effect is a form of tempo balance.
- T F 2. Since jingles can become a crutch for a DJ, their frequency of use should be indicated in the program format.
- T F 3. Manager and broadcaster alike must pay special attention to being objective and maintaining a professional approach to the construction of a play list.
- T F 4. Pleasing the audience comes above all other considerations in determining a radio music format.
- T F 5. The popularity indicated by a song being in the top 10 on the charts also indicates that it's impossible to play it too much.
- T F 6. Information is a secondary consideration of a radio music format.
- T F 7. Songs can be classified by tempo or gender of artist in addition to type of music.
- T F 8. In order to help your audience know what to expect at any given time of day, it's a good idea to play the same songs at the same time each day.
- T F 9. A good way to balance the spot-to-music ratio is to put one spot between every two songs played.
- T F 10. The station radio music format would establish guidelines for announcer self-identification.

Edition Date: March 1989

SUBCOURSE OVERVIEW

This subcourse contains two lessons, giving the senior broadcaster the tools necessary to perform as chief radio announcer. These lessons will provide a general knowledge and understanding of radio formats, critiques, announcing broadcast copy, locally produced spot announcements and features, preproduction process, managing traffic and continuity, the record library, the audience survey, radio remotes, managing an AFRTS radio program package, maintenance, supplies and establishing and maintaining a broadcast SOP.

There are no prerequisites for this subcourse, however, if you do not have a basic knowledge of military broadcasting, it is strongly suggested you complete subcourses: DI0340 Radio, DI0300 Introduction to Broadcasting and DI0320 Basic Announcing Skills.

This subcourse reflects the doctrine current at the time the subcourse was prepared. In your own work situation, always refer to the latest publications.

The words "he," "him," "his," and "men," when used in this publication, represent both the masculine and feminine genders unless otherwise stated.

TERMINAL LEARNING OBJECTIVE

Task: In this subcourse you will learn the duties and responsibilities of the chief radio announcer and the proper method of establishing and maintaining a broadcast SOP.

Conditions: You are given the material presented in this lesson.

Standards: You will demonstrate a basic understanding of the duties of the chief radio announcer and establish and maintain a broadcast SOP.

LESSON ONE

PERFORM AS CHIEF RADIO ANNOUNCER

46R Soldier's Manual Task: 214-177-2001

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn the chief radio announcer's duties and areas of responsibilities.

LEARNING OBJECTIVE:

ACTIONS: Describe the areas of responsibility and duties of the chief radio announcer.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: Define or identify the chief radio announcer's areas of responsibilities and be able to perform all the duties described in this lesson.

REFERENCES: The Material contained in this lesson was derived from the following publications:

DoD 5120.20 R
AR 360-7
STP 46-46R14-SM-TG 1/2/3/4/Broadcast Journalist

DINFOS Radio and Television Handbook
DINFOS Public Affairs Handbook

PERFORM AS CHIEF RADIO ANNOUNCER

INTRODUCTION

The chief radio announcer is very important to military radio operations. Once you have reached this level in your military broadcasting career, you find that responsibility suddenly becomes more than just a word. As chief radio announcer, you will be responsible for implementing the station policies and ensuring they are carried out by your subordinates. The chief radio announcer must be the expert at his radio outlet. This lesson will provide a step-by-step look at the duties and responsibilities of the chief radio announcer.

BE KNOWLEDGEABLE

The chief radio announcer must have a thorough knowledge of all aspects of radio operations. It is hard to supervise personnel when you do not understand the tasks they perform. As the chief announcer, you must know each performance measure it takes to perform a task that your announcers must complete. You must know how to:

- o perform a music program,
- o operate radio control room equipment,
- o announce broadcast copy,
- o perform a broadcast interview,
- o produce radio spots and features,
- o write broadcast copy, and
- o do performance counseling.

This is by no means the entire list. The list could go on and on. The bottom line is simple: KNOW YOUR RADIO OPERATION.

The station's program director is normally responsible to the station manager for establishing program formats for all local shows. The chief radio announcer, in most cases, will have input when formats are devised. Although input into the creative process is important, you are responsible for ensuring that local program formats are followed by staff announcers. To do this, you must know all the formats.

Understand that the objective of the local music program format is to deliver the maximum command information with the minimum annoyance to the music-listening audience. Do this by managing the spot-to-music ratio and the placement of those spots within the music program. The format should hold the listener's attention with a music balance. The format will shape the overall sound of the program.

Consult the latest local audience survey to determine listening habits and music preference. The station programmer will have already set the time slot and style of music for the local shows. You must determine the amount and balance of chart music versus oldies, their placement within the show's on-air window, the number of spots to use in the show, and how often to air those announcements. The survey results can show audience preference for chart or oldie songs and can indicate spot announcement saturation.

Most stations prepare a music wheel (hot clock; Figure 1-1), representing an hour of local show time, as a guide for local disc jockeys. A circle corresponding with the face of a clock is used to show the DJ required, or suggested, show element to air and the approximate time to air it, according to local SOP. It can refer to music selections, spots or jingles/propellants.

Music selection and play should not be left entirely to the show announcer. Music types can be administratively divided into classifications for simple management of the format. Usual classifications are "hot" chart songs, "low" chart songs and oldies. Songs can be further classified by tempo or gender of artist, as desired. To prevent overplaying songs of a particular classification, a system of rotating the music can be devised. File cards can be prepared for the top chart songs that can be rotated when one of the songs is played.

The desired song type is then listed by classification on the music wheel in the position determined to best fit the format objective.

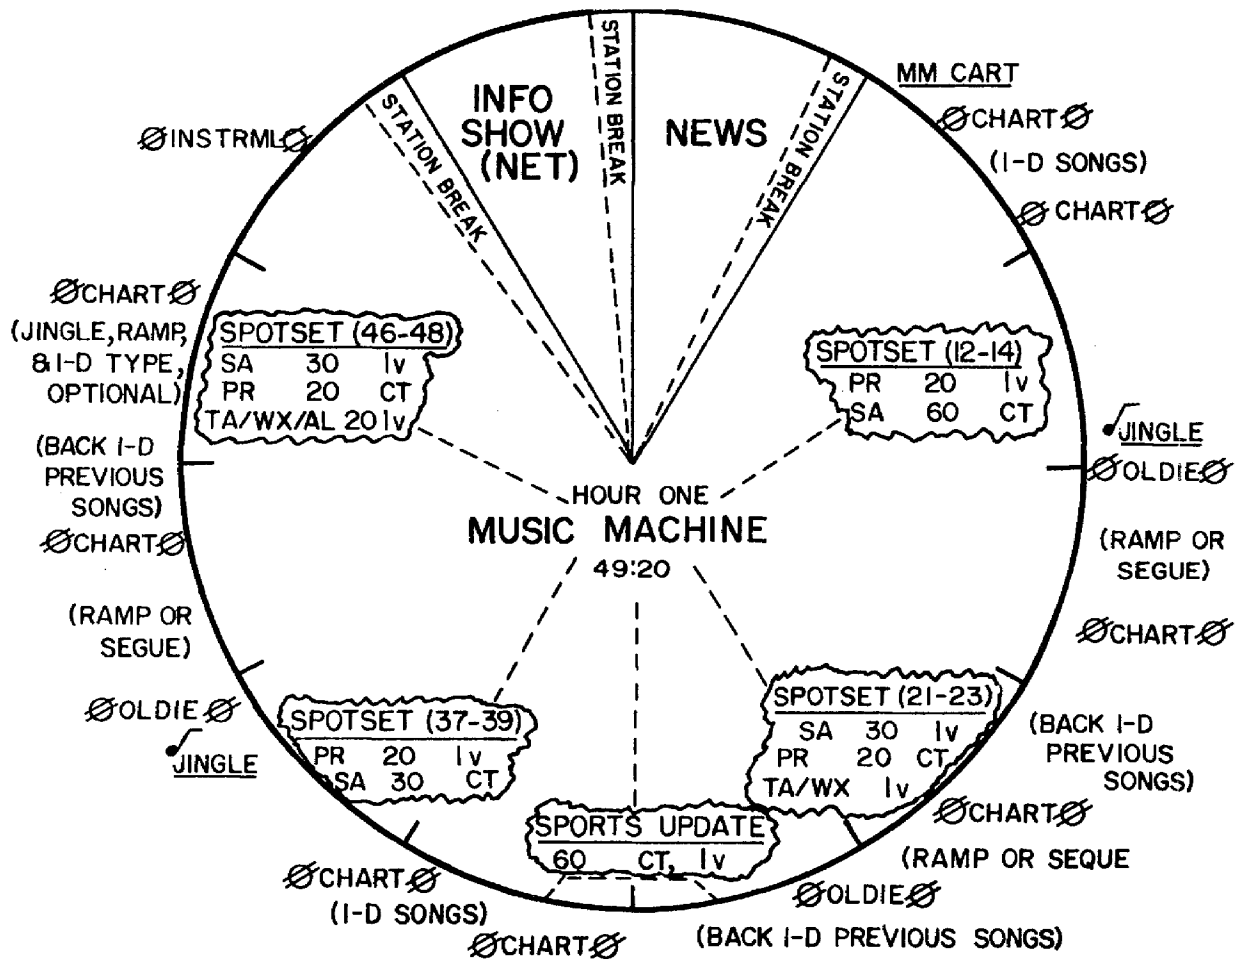

Figure 1-1. Hot Clock

You may determine a need to vary the female-male-group balance of your announcer's playlists. Requiring a loose mix of the three will prevent an "all male" or "all female" sound from dominating your local shows.

The "wave" effect is widely recognized as an effective way to program song tempo to keep the listener's interest. The "wave" means programming an up-tempo song at the start, slowing the tempo down through the middle of the first half-hour, starting the second half-hour with an up-tempo "kicker," slowing the tempo through the middle of the second half, and ending with another up-tempo song.

Determine how many spots to use and how often to air them during the show. This depends on your station's spot-to-music ratio, if it has been established. There is no hard-and-fast formula for this, but the main idea is a balance that is not too heavy on the spot side. The local survey will provide feedback indicating how well balanced your format is. A good start might be a ratio of one minute of spots to six minutes of music. This ratio should be adjusted to fit the local audience needs and desires.

Most stations "cluster" spots together rather than sandwiching them singly between songs. This technique is preferred because it gives the sound of more music being played. Most station music wheels run a spot cluster (spot set) of two or three spots three times an hour.

The spot cluster can be made up of a combination of produced (carted) spots and reader (live) announcements, depending on the command information emphasis. The Traffic and Continuity or Command Information Section can assist you in making this determination.

The music program format should also indicate how often and when supportive material is aired. This includes jingles/propellants, news or sports features, comedy segments, weather, etc.

Give the disc jockey guidance as to how often and when to use produced jingles and music propellants. Without guidance, these program aids can turn into a crutch for the announcer. Jingles should not be overplayed, and it is up to you to decide how much is too much. The key is to balance the program aid with other show elements.

Establish guidelines concerning announcer self-identification, whether that ID be formal or informal. Again, balance is the key consideration.

It is important to your audience that you establish a pattern as to when it can expect certain show elements. And, different time periods will have different emphasis because the nature of the audience changes with the daypart. Information (news, time, weather, temperature, road conditions, school closings) is important to most "morning drive time" audiences. Features may appeal to the midmorning local audience. Afternoon drive time audiences may prefer information segments during the local music show (sports, weather, time, etc.). Consult your latest local audience survey to make this determination.

If you are at an affiliate station, consider the network music program format. If you are given the option to create your station's format, don't differ radically from the network "sound." Your audience expects a certain amount of continuity.

CRITIQUES

The best way to ensure your announcers are in compliance with local formats is to critique their programs. There are a couple of ways to do this.

- o Monitor live broadcasts. Several times a week you should spend time listening to portions of the live broadcast. DO NOT monitor the broadcast by sitting in the studio with your clip board. This will make the announcer nervous and tip him off that now would be a good time to follow the format.
- o Audition air check tapes. Most radio outlets have a 24-hour logger machine, sometimes called the "alibi tape." The 24-hour logger is used every day of the year recording each day's programming. This gives you the luxury of selecting tapes at random to critique. In most cases you should listen to the tape so that you can establish key points you want to bring out in the critique. Note any trends, e.g., too many time hacks, too much or not enough talk, more weather, etc. This will give you a basis for future critiques to note improvement. Be objective and try to help your announcers develop their own style within the boundaries of the station's format.

When listening to your local programming, there are areas you need to pay particular attention to. Is the announcer in compliance with the:

- ☐ music rotation?
- ☐ program log?
- ☐ local broadcast standards established in the standard operating policy or soldier's manual?
- ☐ host-nation sensitivity policy?

Does the announcer:

- ☐ select music that corresponds in tempo and style to the local format?
- ☐ gather and inspect, for air quality, any spots, records, cartridges and other air products needed for the show?
- ☐ rehearse spots, promos and any other material to be read live?
- ☐ update weather forecasts, current temperature and conditions, sports briefs, or other dated material required by the local format?
- ☐ perform music show elements according to the log and local format?
- ☐ overuse jingles, propellants or other production aids?
- ☐ communicate one-on-one with the audience?
- ☐ make comments that are profane, vulgar or offensive to the audience?
- ☐ have dead air during show?
- ☐ "step" on the vocals of a song?
- ☐ use proper announcing techniques?
- ☐ correct mistakes without calling attention to them?
- ☐ avoid an unintentional live microphone?
- ☐ make correct and complete log entries?
- ☐ note deficiencies in equipment or program material for next operator?

When critiquing a staff announcer it is smart to conduct performance counseling. Document the session. You should point out his strong areas as well as his deficiencies. Once you point out a deficiency, always show the announcer the correct way of performing the task. Inform the person what you expect, and reiterate the tasks in your regular training program. Informally review progress daily. Help your announcers by providing constructive criticism in an effort to improve their weak areas. Every 90 days thereafter, conduct performance counseling and review his progress, strengths and weaknesses. Remember that tactful, constructive criticism is more effective and helpful than simply finding fault. If he fails to show improvement, make your superiors aware of the situation. You want them to know that you are aware of and working on correcting the problem. A continued lack of progress on the broadcaster's part may indicate an attitude or learning problem. Appropriate actions should be taken to correct the deficiency.

ANNOUNCE BROADCAST COPY

Your knowledge in announcing broadcast copy has helped you reach the position of chief radio announcer. Always be prepared to share this knowledge with your staff announcers. Introduce them to the tricks of the broadcasting trade. In case you may have forgotten a few of those tricks, here are a few tips on announcing broadcast copy.

- o Before you go on the air, read the copy ALOUD and identify difficult to pronounce words. Check these words in the dictionary, the wire service phonetical guide or station pronunciation guides. As you read, try to determine the meaning and intent of each story. It's impossible to convey the meaning and intent of the story if you don't understand it yourself.
- o Mark the copy for pauses in breathing and also for words that should be emphasized. It is extremely helpful to phonetically rewrite difficult to pronounce words. The phonetic version of the word will also give you confidence in pronouncing it. Check the grammar of the printed copy. Just because it came over a major wire service, doesn't mean it's perfect.
- o Articulate properly by pronouncing all the syllables in each word. For example, when you pronounce the word "breezes" include the "s" sound. Also, don't make sound substitutions such as "dat" instead of "that."

- o Use correct inflection by properly changing the pitch or tone of delivery. Too much or patterned inflection can create a "sing-song" effect, where not enough inflection results in a "monotone" delivery. Inflection should vary the pitch naturally.
- o Phrase the words or groups of words as a unit or group instead of emphasizing each word. Key individual words should still be emphasized. For example, instead of saying, "SECRETARY OF STATE JIM SMITH FLEW TO THE MIDDLE EAST TODAY TO TALK WITH ISRAELI OFFICIALS ABOUT THE NEW PEACE PROPOSALS," in such a way that each word is given equal importance, group the sentence into phrases:

"SECRETARY OF STATE JIM SMITH FLEW TO THE MIDDLE EAST TODAY....TO TALK WITH ISRAELI OFFICIALS....ABOUT THE NEW PEACE PROPOSALS." Speaking in phrases and placing emphasis on key-words within each phrase better communicates the meaning and intent of the story.

- o Use the correct delivery speed/rate. This will usually depend on the subject matter. Generally speaking, sports copy will be delivered at a faster rate than news. An emotional story, such as the death of a child, would be delivered at a much slower rate. A rate of 14 to 16 lines per minute is generally accepted as the average for broadcast copy. A "normal" rate would be one in which the announcer is most comfortable, providing that clarity and voice quality are not sacrificed for speed.
- o A smile or chuckle during the delivery of an emotional or sad story is offensive and unprofessional. The delivery involved with a feature program would probably be more upbeat than other types of radio programs, but it would still depend on the subject matter. A feature on a natural disaster or tragic event in history would certainly not be upbeat.
- o Pause between stories or use transitions. This alerts the listener to the fact that one story has ended and another is about to begin. Also, pausing within a story can emphasize a particular segment.
- o Try your best to avoid stumbling. Even the best announcers stumble on occasion. Stumbling often occurs when the announcer hasn't sufficiently rehearsed his copy. Again, unfamiliar or difficult words should be checked with the dictionary, wire service pronunciation guide or station pronunciation guide.

- o Announce the copy with authority. This comes with proper preparation or rehearsal. If you know the copy and meaning of the story, you can be authoritative in your delivery. You'll better communicate the meaning and intent of the story to your listener.
- o Make sure you complete the broadcast on time. If you are presenting the cast on radio and finish early, you'll probably have some "dead air." If you finish late, there's a good chance that you'll be cut off right at the time you were supposed to end your cast. Be prepared for disaster, such as a cart not playing. Always have alibi copy of a story that's on cart so that you don't leave the listener hanging in case the insert does not air. Bring in enough emergency fill copy to cover your scheduled time on the air.

PREPRODUCTION PROCESS

The chief radio announcer should review the existing SOP in the traffic and continuity department and make sure it is current. The SOP should contain a current list of command-recognized station clients. Station clients are organizations, recognized by the local command, who wish to have their messages delivered to the audience. Such clients would include the Red Cross, Community Services, etc. You must become familiar with any background information concerning each client and establish points of contact to include phone numbers for each organization. You should regularly communicate with each organization.

With client input, yearly emphasis calendars should be created to help schedule, produce and air command information (CI) spots at appropriate times. Brief the personnel responsible for processing traffic and continuity on the audience characteristics and listening/viewing habits, CI emphasis areas, authorized clients and the use of background files.

MANAGING TRAFFIC AND CONTINUITY

There is no specific set of rules governing the amount of spots to be aired. It's your determination. Before making this determination, you need to apply the four basic steps to effective spot programming:

- o Determine Command Information objectives/needs. Once a topic is decided upon, consider its impact on host-country sensitivities. Also consider the degree of application (a single spot or campaign).

- o Research the target audience. Address the demographics of the audience, then choose the method of communication (AM/FM radio, TV).
- o Formulate the spot campaign. Plan ahead for seasonal spots (winter driving, AER campaigns, etc.).
- o Program the spots. Decide whether you need to use "across-the-board" or "random" spot programming. Determine if the spot will be aired during morning drive-time, afternoon drive-time, non-prime time and fringe-time. Vary the spots on the same subject, and avoid using the same spot in the same hour each day. Evaluate the spots to see if they netted the intended results. Certain spots are more effective during certain times of the day.

Ensure the spots are being produced, and perform quality-control checks on completed products. Approve the daily program log in accordance with the local SOP, and remove outdated spot material from the system.

You must ensure that established procedures for labeling, maintaining CI products, and the airing of emergency special announcements are followed. Personnel must be thoroughly briefed. Emergency special announcements usually come through the Red Cross and are verified by the on-duty announcer in accordance with local policy.

REVIEWING PROGRAM MATERIALS

NOTE: One of the most important responsibilities you will have as a broadcast supervisor is to review materials for broadcast release. Once a product airs, it can't be retrieved. Local SOPs should provide basic guidance when it comes to release of material for broadcast. The following information outline pertains to both radio and television unless otherwise specified.

Make sure the product being aired conforms to SECURITY, ACCURACY, POLICY, and PROPRIETY (SAPP).

Security Measures

Security measures for the Army are outlined in AR 380-5. Disclosure of classified information definitely violates this regulation. Always check first when in doubt. Also, comments that are sensitive (but not classified) should not air. An example of this would be a pilot who proudly announces that it "only takes five minutes for he and his fellow chopper pilots to get into the air after the first warning." The comment is not classified but may be helpful to an enemy or potential enemy.

Accuracy

Make sure the information is accurate. Check the spelling of names; make sure the ranks are correct and unit designations are correct (e.g., there are "batteries" not "companies" in field artillery units), etc. Even stories that are generated and released by the PAO should be checked for accuracy.

Policy

Be familiar with public affairs policy outlined in AR 360-5 (Army Public Affairs-Public Information) , AR 360-61 (Community Relations) and AR 360-81 (Command Information Program).

The following regulations also contain policy considerations that reviewing officials need to know. The broadcast supervisor must be familiar with the content of these regulations in case they are needed for quick reference: AR 340-17 (Release of Information from Army Files and Records); AR 340-21 (The Army Privacy Program); AR 3680-80 (Release of Information When More Than One Service is Involved in Accident or Incidents); AR 380-5 (Department of the Army Information Security Program), and DOD Directive 5122.10 (American Forces Information Service). When working at an overseas AFRTS outlet you must be familiar with DoD directive 5120.20 R (Armed Forces Radio And Television Service) and AR 360-7 (Army Broadcast Service).

Propriety

Propriety is doing what is right and proper. Ensure the broadcast material is in good taste and does not violate the sensitivities of the listening audience. There are several things that would prevent broadcast material from being aired: vulgarity, obscenity, gore, perversion, excessive violence, and information that holds the service or its members up to ridicule.

Sensitivities

Most overseas stations maintain a local sensitivities file. Its purpose is to give guidance concerning the broadcast of issues considered controversial by the host-country government. There are also set procedures for reviewing material for host country sensitivities.

When it is necessary to remove host country sensitivities from entertainment material, AFRTS outlets are authorized to reproduce (dub) the original program to facilitate removal

Privacy Act

Because of the Privacy Act, broadcast material should not include certain information without permission of the individual concerned. This includes: street addresses; social security numbers; telephone numbers; information contained in medical and personnel files; and information pertaining to on-going disciplinary actions which would clearly be an unwarranted invasion of personal privacy.

Libel

Libelous information must be deleted from any material intended for broadcast. Basically, you must not say anything about persons, groups, organizations or businesses that expose them to hatred or contempt, lower them in the esteem of others, causes them to be shunned, or injures their business. Examples of some libelous words are: "drunk, radical, dishonest, unethical, a cheat, criminal (unless convicted), a traitor," etc.

News Analysis And Commentary

Locally produced news analysis or commentary is another example of policy violation. They are expressly forbidden. Only those analyses or commentary programs provided by AFRTS-BC may be aired. This material must still be reviewed for broadcast. Certain comments may be fine in Panama but not in Korea because of host-country sensitivities. Again, local SOP should provide guidance in this area, but if a news analysis or commentary program is aired, it must be aired in its entirety. Radio news actualities and correspondents' reports may be excerpted from network newscasts but must be excerpted in their entirety. News sources/networks that authorize their television programming to be excerpted are identified in DoD Regulation 5120.20 R, APPENDIX F.

Technical Considerations

Another technical consideration for radio is to ensure audio quality. You need to assume the role of the listener. You should be able to understand the intended message by listening to the material. Check for consistent audio levels.

Make sure the material is correctly timed. Running time for radio material covers first and last audio. If there is a discrepancy, make sure the person responsible for programming is made aware of it IAW local SOP.

RECORD LIBRARY

Another critical area of responsibility is the station record library. AFRTS record libraries must be maintained in a neat and orderly manner. Card files are updated with each incoming shipment from AFRTS-BC. AFRTS card files provide a cross-reference system that allows announcers to look up records by artist or title. These files are normally the most difficult part of the library to maintain.

You will find out that most announcers dread the mission of having to file library cards from new shipments. The radio chief announcer must closely monitor the filing of cards. Without the cards, it is sometimes impossible to locate a certain selection without physically going through entire sections of the record library.

Radio library materials should be separated by music type or category. Record sleeves, or "shucks," should be labeled in accordance with local policy. Normally the record number is placed on the sleeve itself. This allows the announcer to locate the number in the card file and then find the record, which is in numerical sequence. The record librarian is also responsible for ensuring that record shucks are maintained in good condition and that all deficiencies are brought to the chief radio announcer's attention. Whenever possible, emphasize care when handling the records. Set a policy for cleaning the records, using a professionally accepted method. This will depend upon the availability of cleaning materials.

Record accountability is your responsibility. You should establish a policy on the removal of records from the record library. Use a system of sign-out cards to be inserted in the record's space after removal. When the record is returned, the card can be removed. Set a policy concerning the removal of records from the radio section. Records should never be allowed to be signed out for unofficial

purposes. Except for remote broadcasts, which meet criteria set forth in AR 36-7, records should never leave the station. A semiannual inventory of all radio materials must be conducted.

Most radio outlets require that the top chart songs are recorded onto tape cartridge. This prevents wear and tear on records and provides a format control for the program director. The chief radio announcer must ensure that chart songs are properly recorded. Does the tape cue up properly and was the cartridge properly erased prior to recording? Basically, if the song is cued properly and the recording is clear, the tape cartridge is OK.

It is the responsibility of the chief radio announcer to ensure that music charts are updated. Local station SOP normally spells out how this is done. Outlets most often require that Pop, Soul and Country charts be maintained. Charts should be updated on a weekly basis or whenever the latest chart has arrived. Keep up with the charts so that your audience is kept abreast of the latest in stateside musical entertainment.

AUDIENCE SURVEY

While the chief radio announcer isn't responsible for conducting an audience survey, this doesn't mean you will not be assisting with your station's annual survey. Most often the chief radio announcer is heavily involved in the survey project, working under the guidance of the section NCOIC or program director. Thus it is important for you to be familiar with the survey process.

No one tells us to conduct surveys, but they are conducted because they are a necessity if you wish to determine the needs of the audience. Review the section in the local SOP that deals with audience surveys. If the SOP does not contain such a section, write one. The section should include a statement on the frequency of surveying the local audience, the sampling methods most effective, and distribution and disposition instructions of the survey findings. Normally, you will want to survey your audience yearly.

Survey Purpose

Define the purpose of the survey by:

- o stating the problem (reason for the survey);
- o identifying the population (group from which you select the people to answer the questions);

- o writing a statement of the objective(s) (what can you expect from the survey),

- o and explaining how the survey findings will be used.

Promote the fact that you are going to conduct the survey so you don't surprise your audience. Also, compile a mailing list of the intended population.

Audience Sample

In conducting an audience survey, it is critical to sample a carefully selected part of the TOTAL AUDIENCE in such a way that the SAMPLE has the same characteristics as the total audience. There are five ways of sampling an audience:

- o RANDOM SAMPLE--respondents are identified through a random selection method;
- o STRATIFIED RANDOM--before a sample is chosen the respondents are broken up into categories such as age, sex grade, education, etc.;
- o CLUSTER--pick up the desired number of respondents in groups;
- o SYSTEMATIC--follows a pattern such as selecting every tenth name on a list of potential respondents;
- o QUOTA--used in the personal interview method; each interviewer is given a set number of persons to query The RANDOM SAMPLE is the method most often used and recommended.

Types Of Questionnaires

Construct a questionnaire to record the respondent's answers. There are two types: self-administered and interview-administered. For self-administered, the respondent fills out the form himself. Someone else records the answers on the interview-administered questionnaires. The main difference is that you must include directions for the respondents with the self-administered questionnaire.

In either case, make the questionnaire easy. When constructing the questionnaire, ask yourself: Who will answer the questions? How will the responses be recorded? What do we really want to find out? Print more questionnaires than are needed. These can be used to train interviewers, provide sample copies and to replace spoiled, damaged or lost copies. Questionnaires should begin with identifying information (name or title of the survey), information about the subject, and then demographic information about the respondent

TYPES OF SURVEYS

With few exceptions, an audience is large and spread out over a fairly large area. Keeping this in mind, three types of surveys should be considered: TELEPHONE, PERSONAL (face-to-face), and MAIL. There are advantages and disadvantages to each of the types, but the MAIL survey is most often used.

If you chose a TELEPHONE survey, train the people you will use to conduct the interview. Use a short list of questions, as people tend to not want to stay on the phone for long periods of time. Don't use personal questions. People are generally suspicious about the use of such questions over the phone. Instruct the interviewers not to be biased when asking questions and to record the answers on the questionnaire.

If you choose the PERSONAL (face-to-face) interview, train the people to be more persistent during the interview. Also, instruct them to use follow-up questions and use visuals to aid recall. Instruct the interviewers not to be biased when asking questions and to record the answers on the questionnaire.

If you choose the MAIL survey, use a cover letter with the questionnaire. The cover letter should state the purpose of the survey, the confidential nature of the responses, address of the sponsoring agency (your unit), the date the letter was completed and the survey number.

Types Of Survey Questions

Extracting factual information is much easier than getting a true measure of opinions. You have several choices as to the kinds of questions for finding out how much someone knows about a subject:

- o OPENED-ENDED--Questions that allow the respondent to answer in his own words;

- o CHECKLIST or MULTIPLE CHOICE--Questions that give the respondent a selection of possible answers. You should include an "other" category where the respondent can indicate a choice not given on the list (this is particularly helpful in pretesting);
- o DICHOTOMOUS (divided into two parts) --Questions that are of the "yes or no" or "true or false" types. You should include "not sure" or "don't know" so that the respondent is not forced into a decision if he is really uncertain;
- o RANK ITEMS--The respondent is given a list of items and asked to assign a rank (1,2,3, etc.) to them. This would be useful in ranking audience preference for different types of radio music shows or programs;
- o AGREE-DISAGREE--This approach asks the respondent to indicate whether he agrees, disagrees or has no opinion with regard to the statement;
- o OPINION SCALES--These are usually three-, five-, or seven-point scales that can be used to measure the intensity of feeling about a subject (e.g., How important are Sources of news to you?). Each source would be rated:

— —	1	— —	very important
— —	2	— —	somewhat important
— —	3	— —	so-so
— —	4	— —	somewhat unimportant
— —	5	— —	not important

Questions should be as short as possible and without any professional jargon or technical words. They should generate exactly the information desired and in terms that would assist the tabulation and statistical analysis.

Do not OVERLAP CATEGORIES (choices like 18-20, 20-22, 22-24). Which age group would you choose if you were 20 years old?

Avoid MULTIPLE-MEANING questions. An example of this would be: Which medium is best for news and entertainment? Each question should limit itself to one point.

Do not use LEADING questions such as: Would you say that you are in favor of more radio news? Reword the question to something like: Are you in favor of more radio news? This is not leading. Avoid using CATCHWORDS or words with emotional connotation (draft-dodger, rapist, "commie"). These words elicit strong feelings that influence how a person will respond.

If feasible, use CHECK questions. These are questions that ask for the same information as another question but are worded differently and placed in different parts of the survey. For example: Do you listen to SEN FM? What is your favorite SEN FM show? would bring out the internal consistency of the responses.

Arrange the questions in a logical manner that will avoid confusion and misunderstanding. Opening questions should be easily answered. Questions that might embarrass the respondent should be towards the end. Keep the knowledge and opinion questions separate and questions dealing with the same subject together. Demographic questions should be placed at the end because the respondent is more likely to describe himself after he has been asked for his knowledge about the subject. Leave a space at the end of the survey for the respondent to express his personal feeling about the survey subject or survey itself. And, always thank the respondent for cooperating.

Questionnaires should always be pretested on a group of the intended population. Pretesting allows you a chance to deal with problems concerning question wording, answer choices and interview procedures. Talking with the pretest group will also point up additional possible questions and problem areas.

Determining Sample Size

When determining sample size, we are concerned with two things: ACCURACY (reliability) and CONFIDENCE (risk). The sample size can be determined by the accompanying table (Figure 1-2) which is indexed by the size of the total population (audience) and the desired level of reliability. The most commonly used error or accuracy tolerance is plus or minus 5 percent with 95 percent confidence limits. This means that 95 of 100 random sample surveys will not vary from the true population percentage by more than plus or minus 5 percent.

For example, if 50 percent of the sample said that they watch the 6 o'clock news, this means that the true viewing audience may be as much as 55 or as little as 45 percent of the total audience. Figure 1-2 shows the sample size you need to achieve different levels of accuracy with 95 percent confidence.

**SAMPLE SIZES NEEDED FOR DIFFERENT LEVELS
OF RELIABILITY**
(95% Confidence Limits)

Population Size	LEVEL OF RELIABILITY			
	+2%	+3%	+4%	+5%
50	49	48	46	44
100	96	92	86	80
250	226	203	177	152
500	414	341	273	218
1000	796	516	375	278
2000	1116	696	462	322
3000	1334	787	500	341
4000	1500	842	522	356
5000	1622	879	536	357

Figure 1-2. Sample Sizes.

For an audience of 4,000 and an error or accuracy tolerance of plus or minus 5 percent with 95 percent confidence limits, we need to randomly select 350 people.

Let's say you decide to use a mail survey to determine how many watch the six o'clock news. Should you only send out 350 questionnaires? No, but you need to ensure that you get at least 350 back. There is a formula to give you the needed number of questionnaires that have to be sent.

$$\frac{350}{\text{---}} = \frac{20}{\text{---}}$$

$$X = 100$$

The typical response rate to a mail survey ranges from 20 to 30 percent. So, the figure of 350 becomes 20 percent of the total number of questionnaires that were sent out. In the above formula, "X" is the number of questionnaires needed to make 350 equal 20 percent. Use 20 percent as the MINIMUM rate of return. To work the formula, multiply 350 x 100 which gives you a figure of 35,000. That figure is then divided by 20 which gives you 1,750 which equals X.

$$350 \times 100 = 35,000$$

$$35,00 \text{ divided by } 20 = 1,750$$

$$1,750 = "X"$$

$$\frac{350}{\text{---}} = \frac{20}{\text{---}}$$

$$1,750 = 100$$

To better ensure that you receive at least 350 questionnaires back from your survey, you need to send out, at the MINIMUM, 1,750 questionnaires.

You have sent out 1,750 questionnaires and have received 350 responses. The survey showed that 80 percent of the respondents watches the 6 o'clock news. Can you safely say that 80 percent of the total audience watches the 6 o'clock news? No, you can't. The 80 percent figure falls within a range called the CONFIDENCE LIMITS.

Figure 1-3 shows the percent spread or variability for different percentages obtained from sample sizes given 95 percent confidence.

**VARIABILITY FOR DIFFERENT SAMPLE SIZES
AND OBTAINED PERCENTAGES
(95% Confidence Limits)**

Sample Sizes	Obtained Percentages											
	99 1	98 2	95 5	90 10	85 15	80 20	75 25	70 30	65 35	60 40	55 45	50 50
10	6.3	8.9	13.8	19.6	22.6	25.3	27.4	29.9	30.2	31.0	31.5	31.6
50	2.8	4.0	6.2	8.5	10.1	11.3	12.3	13.0	13.5	13.9	14.1	14.1
100	2.0	2.8	4.4	6.0	7.1	8.0	8.7	9.2	9.5	9.8	10.0	10.0
200	1.4	2.0	3.1	4.2	5.1	5.7	6.1	6.5	6.7	6.9	7.0	7.1
300	1.1	1.6	2.5	3.5	4.1	4.6	5.0	5.3	5.5	5.7	5.7	5.8
350	1.0	1.5	2.4	3.2	3.8	4.2	4.6	4.8	5.0	5.2	5.4	5.4
400	1.0	1.4	2.2	3.0	3.6	4.0	4.3	4.6	4.8	4.9	5.0	5.0
500	0.9	1.3	2.0	2.7	3.2	3.6	3.9	4.1	4.3	4.4	4.4	4.4

Figure 1-3. Sample Sizes.

To determine the spread or variability, you find the intersection of the sample size and the percentage obtained from the survey. The figure, which is the intersection of 350 (sample size) and 80 percent, is 4.2. This is then subtracted from and added to 80 percent to give you the true percentage of the total audience that watches the 6 o'clock news. When reporting the results to your commander, you can be confident in saying that in 95 of 100 such surveys, the true viewing audience of the six o'clock news is between 75.8 and 84.2 percent. Report this and any other desired information to the commander. Then file the results of the survey IAW local SOP.

RADIO REMOTES

The chief radio announcer from time to time will be called upon to set up for a broadcast originating from a remote location. The types of equipment and the rules of broadcasting differ from that of studio operation. Radio remotes can be handled in different ways. This section will present one avenue of approach.

Types Of Remotes

Remote broadcasts cover many types of events. The Armed Forces Radio Service outlet in Athens, Greece, is a prime example. Each year the outlet receives requests for remote broadcasts from the sports office, the education center, officer and NCO wives clubs and other base agencies. Basically, anything that would be of interest to the military population is worth considering. The station in Athens broadcasts from remote locations covering base sporting events (softball, football and basketball), at the post exchange during Education Day (talking to college registrars and prospective students), and sometimes even taking local radio programs to locations such as the recreation center and cafeteria. Remotes not only help draw crowds to help pass out information but are also good public relations for your outlet.

First Things First

What's first on the list of things to do? Let us suppose that you've just received a request from the sports office to cover the base football team. This is backed up by a personal request from the base commander. Do you immediately say yes? Not unless you've already evaluated the event. Never commit yourself until you've researched the request. What to look at before you commit your resources:

- o Will broadcasting this event meet audience needs?
- o Is this a valid request? Does it violate DoD or AFRTS regulations?
- o Do you have personnel who are knowledgeable and capable of doing play-by-play coverage? Are they available for the mission?
- o What type of equipment do you have available? Are there power sources available at the remote location? Talk to the station engineer to find out if the broadcast is feasible.

- o What type of facility will the team broadcast from? Will personnel and equipment be protected from the elements? Football games are not normally called due to inclement weather.
- o Don't forget about transportation? You'll need to transfer equipment and personnel to the remote location.
- o Present the request for coverage and your evaluation to the station manager. Never go into his office without research to back up your decision. A good station manager or program director will always take a critical look at any requests for a remote broadcast. If you want to broadcast the event, then have your facts in order.

Preproduction Meeting

The preproduction meeting is where the whole operation starts coming together. The sections below should be present.

- o Traffic and continuity. These folks are normally responsible for preparing the station program log and assigning spot productions. Promotion spots need to be produced to advertise the game. Never underestimate the need for publicity. The halftime period needs to be blocked out as to what is going to happen when. Interviews, a review of the first half action, news and sports updates all need to be scheduled.
- o Engineering. The engineering section makes it possible to get the remote signal back to the station. Maintenance personnel are responsible for testing and setting up the remote equipment and ensuring the proper power sources are available.
- o Radio Operations. The play-by-play announcer, the color man and the statistician all need to be present for this meeting. Together you and the play-by-play team devise a format for use during the game. Intros and outros need to be written along with standard introduction, spot break and closing cues.
- o Sports office. This provides instant communication with a sports office representative who can fill you in on questions about the remote broadcasting area and game day operations.
- o Public affairs. A representative from the public affairs office will provide you with another medium for getting the word out to the base population.

Have the engineering and traffic and continuity sections provide you with written status reports on their efforts. The chief radio announcer must keep a file on all action generated by the remote broadcast. This provides you with information for future remotes.

What About The Visiting Team?

Chances are the Armed Forces Radio Service (AFRS) has an outlet serving the visiting team. Call the chief radio announcer at the outlet and ask for assistance in gathering information on the team. Normally you'll be able to get names, uniform numbers, biographical information and possibly a rundown on the key players. If technically possible, offer the football broadcast to the outlet. AFRS Athens, with the assistance of personnel at the base switchboard, was able to transmit games all over the Mediterranean. This needs to be planned far in advance to guarantee the availability of phone lines.

The Big Day

The day of the game has arrived, equipment is ready, talent is in place and your fingers are crossed hoping that nothing goes wrong. Remember the broadcaster's friend Mr. Murphy; whatever can go wrong, will go wrong when you least expect it. Anticipate problem areas such as equipment malfunctions or inclement weather. Ensure that a station engineer is present at all times during the game.

The Wrap Up

The game is over, equipment has been returned back to the station and personnel have been released. You're finished, right? Wrong. While the production of the game is still fresh in your mind write your after-action report. Try to be thorough and keep in mind the report will be used for reference in further sports broadcast productions. Point out the things that went well and the areas where you had problems. Your after-action report should then be placed in the game file. This file provides you with a good head start on what to direction to take during your next football broadcast.

MANAGING AN AFRTS RADIO PROGRAM PACKAGE

Assign someone in the radio section the responsibility of maintaining each radio shipment received and sent forward. This job is often the responsibility of the record librarian. You should ensure that missing, damaged or defective items are identified. The chief radio announcer should then notify AFRTS-BC directly. Notification also is required if more than five days elapse after the expected arrival date of a shipment. For circuited materials, the chief radio announcer should notify the preceding outlet as well as those following on the circuit.

Audio materials have to be separated by program type (e.g., RU, FML, RP, etc.). Check to see that RP, RU, 40-C and FMP materials are filed in accordance with the local program schedule and SOP.

Ensure that outgoing material is processed for shipment. The RU materials should be inventoried, packaged, labeled and shipped to the next station on your circuit (if needed). The following procedures apply:

- o inventory all items to be shipped,
- o pack the items in sequentially numbered boxes,
- o annotate the inventory to show the box number in which each item was shipped and the shipping dates,
- o enclose one copy of the inventory in box number one,
- o forward one copy of the inventory, by letter, to the receiving station, and
- o retain one copy of the inventory in the section/department files.

When local destruction of radio materials is authorized, inventory the records and then deface both sides. Turn in the records to a military/DoD property disposal officer and obtain a turn-in certificate. If this is not practical, dispose of the records, prepare a certificate of destruction and have it signed by a representative of the outlet performing the destruction and the OIC or station manager who witnessed the disposal. A copy of the turn-in certificate or the certificate of destruction, along with a copy of the inventory, will be forwarded to AFRTS-BC. Retain copies of these documents at the station for one calendar year. DoD 5120.20 R APPENDIX F governs the destruction of record materials.

When AFRTS authorizes the local destruction of FM stereo tapes, they will be degaussed (erased) and used for other purposes within the station. Otherwise the destruction process is the same as for records. When AFRTS-BC authorizes the local destruction of other types of radio materials, special instructions will be provided. If radio program material is lost, damaged or destroyed due to causes other than normal wear and tear, a report of survey will be prepared. Upon approval, the findings will be reported to AFRTS-BC.

CONUS STATIONS

CONUS stations are not part of the AFRTS system and therefore are authorized to use only news, entertainment and command information programs produced by the U.S. Army Command Information Unit (USACIU). Programs furnished by this agency do not have to be returned. They are to be disposed of locally via property disposal or other controlled procedures. Soldiers Radio And Television (SRTV) programming may be requested. Commercial records and tapes are usually budgeted for and purchased locally.

MAINTENANCE

The chief radio announcer must regularly check the operability of radio control room equipment. Conduct a daily check of the control rooms. Keep a maintenance log for the announcers to annotate when problems occur. Ensure this information is passed along to the section supervisor or studio maintenance technician in accordance with local SOP. Keep your staff announcers informed of equipment status to avoid unexpected problems during their air shift or production time.

SUPPLIES

Broadcast supplies, such as cotton swabs, razor blades, tape cartridges, reel-to-reel tape, special radio operation forms and other items must be kept in stock. It is your responsibility as chief radio announcer to ensure announcers have the tools to do their job.

THE BOTTOM LINE

The bottom line in any successful broadcast operation is to be thoroughly knowledgeable of your radio operation and the personnel who work for you. Know their weaknesses and strong points, and use those to your advantage. Ensure that when you assign an announcer a program, he has all the programming aids necessary to perform the task. Make sure jingles and music propellants are up to date. Check that emergency fill material is available in the studio in accordance with the local SOP. Follow local SOP in posting alert/emergency announcement material in the studio. Study the regulations and SOP. Always provide answers to questions from broadcasters. STAY ON TOP OF EVERYTHING WITHIN THE RADIO DOMAIN.

PRACTICE EXERCISE

LESSON # 1

PERFORM AS A CHIEF RADIO ANNOUNCER

SUBCOURSE NO. DI0450

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The station's program director is normally responsible to the station manager for establishing formats for all local shows.
- T F 2. The objective of the local music program format is to deliver the maximum command information with minimum annoyance.
- T F 3. Local program music selection should be left up to the show announcer.
- T F 4. Most Armed Forces radio stations sandwich spots singly between songs.
- T F 5. One recognized way to critique a staff announcer is by sitting in the studio during his show.
- T F 6. One of the most important responsibilities the chief radio announcer has is reviewing materials for broadcast release.
- T F 7. DoD Regulation 5120.20 R provides for locally produced news analysis and commentary.
- T F 8. Propriety is doing what is right and proper.
- T F 9. Station clients are organizations, recognized by the station manager, who wish to have their messages delivered to the audience.
- T F 10. A semiannual inventory of all AFRTS record materials must be conducted.

- T F 11. AFRTS records should never leave the station.
- T F 12. Before committing yourself to a remote broadcast, you must thoroughly evaluate the request.
- T F 13. Local destruction of FM stereo tapes is accomplished by bending and striping the reels of tape.
- T F 14. Normally, AFRTS outlets survey every two years.
- T F 15. The Chief radio announcer should conduct a weekly check of the station's control rooms.
- T F 16. The systematic approach is the most often used method to sample an audience.
- T F 17. Questionnaires should lead off requesting demographic information about the respondent.
- T F 18. Open-ended questions allow the respondent to answer in his own words.
- T F 19. Questionnaires should always be pretested on a group of the intended population.
- T F 20. When determining population sample size, we are concerned with accuracy and confidence.

LESSON TWO

ESTABLISH AND MAINTAIN A BROADCAST SOP

46R Soldier's Manual Task: 214-177-3454

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn to establish and maintain a broadcast SOP.

LEARNING OBJECTIVE:

ACTIONS:	Describe the information and steps required to establish and maintain a broadcast SOP.
CONDITIONS:	You will be given the material presented in this lesson.
STANDARDS:	Establishing and maintaining a broadcast SOP will be in accordance with 46R Soldier's Manual Task 214-177-3454.
REFERENCES:	The Material contained in this lesson was derived from the following publications: DA PAM 310-1 DA PAM 310-2 DA PAM 310-3 STP 46-46R14-SM-TG 1/2/3/4 Broadcast Journalist Soldier's Manual and Trainer's Guide

ESTABLISH AND MAINTAIN A BROADCAST SOP

INTRODUCTION

To function smoothly and efficiently, each section in a broadcast operation operates under the guidance of standing operating procedure (SOP). The SOP provides information consisting of responsibilities and procedures used to accomplish the mission. Your section SOP should be written as an orientation tool for newcomers and as reference material for current staff members. A newly assigned broadcaster should be able to read the section SOP and understand the mission and the procedures used. Your SOP will help avoid panic situations that arise from a mission requiring a long-unused procedure. A staff member simply looks it up in the SOP and he is on the way to completing the assigned task. A thorough section SOP is a valuable and time-saving document.

STANDING OPERATING PROCEDURE

For the purpose of this lesson we will only be concerned with the process of outlining the steps that pertain to one procedure. The process may then be repeated to include all the procedures in your operation, providing you with a complete SOP.

Your avenue of approach should be to determine which tasks in your section are recurrent. Select one of those procedures to work with. As an example, this lesson will use the record library procedure of inprocessing AFRTS shipments.

Writing The Procedure

There are several steps to assist you in writing the procedure.

- o Observe section personnel performing the procedure and note the steps in the procedure.
- o Make note of any deficiencies.
- o Ensure the procedure meets all requirements of the existing publications and directives.

- o If necessary, modify the procedure to make it efficient and to make it conform to all current policies.

NOTE: One procedure that must be addressed in any broadcast operation is ordering broadcast supplies. The method for this procedure should be structured according to local operating procedures of the station network. Confer with the station's property book officer for the proper forms and their completion. Instructions for ordering broadcast supplies should be part of the broadcast SOP.

Title

To begin your procedure, start with the title, the current date and SOP number. The number can be obtained from the administration office or derived from the section for internal use.

EXAMPLE:

INPROCESSING INCOMING AFRTS RECORD LIBRARY MATERIALS

19 NOV 95
No. 21-5

Purpose

Next on your list is the purpose section. Write a paragraph indicating briefly the system, activity or procedure.

EXAMPLE:

PURPOSE. Explain the steps necessary to unpack, inspect, inventory, catalog, file and account for AFRTS radio programming materials in accordance with DoD Regulation 5120.20 R, APPENDIX F and the network and local SOP's.

Scope

Write a scope section indicating to whom the procedure applies.

EXAMPLE:

SCOPE. The procedure outlined in this section pertains to all assigned personnel.

Definitions Section

Do not overlook the definitions section. Explain the terms and acronyms that pertain to the procedure.

EXAMPLE:

DEFINITIONS.

RL	Radio Library (unit)
BP	Radio Priority (unit)
RU	Radio Unit
RPL	Radio Priority Library (combination of RP and RL)
40-C	American Top 40 and American Country Countdown
FML	FM Library
FMP	FM Priority
TP	Tops in Pop
P	Popular
C	Classical
W	Western
MB	Marching Band
SEL	Sound Effects Library
PML	Production Music Library
MISC	Miscellaneous
AFRTS-BC	Armed Forces Radio and Television Service Broadcast Center
X	Christmas Music
IAW	In accordance with

Responsibilities

Each SOP must have a responsibilities section explaining the major functions of the supervisor and subordinates involved in the procedure.

EXAMPLE:

RESPONSIBILITIES.

All radio section personnel are responsible for knowing the steps involved in unpacking, inspecting, inventorying, cataloging, filing and accounting for AFRTS radio program materials.

The supervisor is responsible for ensuring that all steps in the inprocessing procedure are carried out correctly in accordance with station standing operating procedure and DoD Regulation 5120.20 R, APPENDIX F.

The Procedure Section

The next step in the process is to write a procedures section, detailing step-by-step how the procedure is to be performed. Also, include in this section performance standards and quality control information.

EXAMPLE:

Radio personnel assigned to process incoming AFRTS records must adhere to the following guidance.

1. When incoming radio materials arrive at the station or outlet, you must first unpack the shipment. Then, inspect the material to ensure all items are present and not damaged. You should check the records and tapes against the packing list for accountability. Check for damage or defects. If any of the material is damaged or defective, notify AFRTS-BC directly. The notification should include disposition instructions for the damaged material. AFRTS-BC may direct the material to be returned for inspection or may authorize local destruction.

NOTE: Prompt notification is also required if more than five days have elapsed after the expected arrival date of a shipment. For circuited materials, the outlet should notify the preceding outlet as well as those following on the circuit. A limited number of copies of tapes and discs are normally held at AFRTS-BC as replacements for damaged or lost shipments. This small supply is retained for a short period of time and is then recycled. Therefore, prompt notification is essential. The message and mailing address for AFRTS can be found in DoD Regulation 5120.20 R, APPENDIX F.

2. The audio materials should then be separated according to program type (e.g., RU, FML, RP, etc.). Artist/title cards should also be separated. You should also separate all other programming material, such as music charts, bio sheets, newsletters, FML music listings, etc.
3. The RL materials are then separated by music type or category (e.g., W, C, P, MB, MISC, etc.). RL record covers are then labeled on both sides in both the left and right-hand upper corners with the proper classification and number.

EXAMPLE:

P-24506/7

P-24506/7

To further assist announcers with selecting music, popular music covers will be color coded with a one inch centered mark along both outside edges of the record covers.

COLOR CODES:

- o Red. Albums with various artists.
- o Yellow. Albums featuring various artists with hits from the past.

The FML tapes are then filed chronologically in the program bins located in the record library. The artist/title cards are then filed alphabetically. The FM music listings are attached in chronological order to the clipboard in the library identified for that purpose.

4. Radio specials are sometimes made available by AFRTS-BC. The type and timeliness of the material will determine whether the shipment is provided on disc or tape and which outlet will receive it. Instructions for use and disposition will appear on the packing lists.
5. A supervisor's evaluation guide is provided in Annex A.

Files

If files are involved in the procedure, write a FILES section indicating the location of the files and explaining what files are to be established and maintained.

Example:

FILES.

The AFRTS artist/title card files are located in the record library. The chief radio announcer is responsible for ensuring the files are up to date and in order.

Reference Section

If applicable, write a references section, listing all of the publications that govern, guide or pertain to the procedure.

EXAMPLE:

REFERENCES.

DOD REGULATION 5120.20 R, APPENDIX F STP 46-46R 1/2/3/4
SOLDIER'S MANUAL AND TRAINER'S GUIDE FOR BROADCAST
JOURNALIST, AUGUST 1988.

Annexes

If examples of completed procedures are needed, prepare an annexes section. Include in this section sample forms, records, and formats that illustrate the procedure. Alphabetically label each annex (e.g., Annex A, B, etc.).

EXAMPLE:

ANNEX A

Guide for evaluating the inprocessing procedure of AFRTS radio program shipments.

Checklist:

- 1. Unpacks incoming radio shipment.
- 2. Inspects radio materials against the packing list for accountability and for damage.
- 3. Directly notifies AFRTS-BC if any of the shipment is lost, damaged or contains defects.
- 4. Notifies preceding station and next station on the circuit.
- 5. Separates and labels program materials in accordance with SOP.
- 6. Files RL records IAW SOP.
- 7. Files FML tapes chronologically, IAW SOP.
- 8. Files artist/title cards alphabetically.
- 9. Files FM music listings IAW SOP.

- 10. Places radio materials in the appropriate location prior to airing, IAW SOP.
- 11. Processes outgoing radio materials to the next station on the circuit, if requested.
- 12. Destroys RP materials IAW AFRTS-BC DP-1 and files destruction documents.
- 13. When authorized, locally destroys records and files destruction documents.
- 14. When authorized by AFRTS-BC degausses FM tapes to be used for other purposes within the station. If not authorized, destroys FM tapes and files destruction documents.
- 15. Provides AFRTS-BC a copy of destruction documents for items #12, #13, #14.

Now that all of the steps in the procedure are completed it's time to put together the draft. An example of the procedure starts on the next page.

THE PROCEDURE DRAFT

INPROCESSING INCOMING AFRTS RECORD LIBRARY MATERIALS

19 NOV 95
No. 21-5

PURPOSE. Explain the steps necessary to unpack, inspect, inventory, catalog, file and account for AFRTS radio programming materials.

SCOPE. The procedure outlined in this section pertain to all assigned personnel.

DEFINITIONS.

RL	Radio Library (unit)
BP	Radio Priority (unit)
RU	Radio Unit
RPL	Radio Priority Library (combination of RP and RL)
40-C	American Top 40 and American Country Countdown
FML	FM Library
FMP	FM Priority
TP	Tops in Pop
P	Popular
C	Classical
W	Western
MB	Marching Band
SEL	Sound Effects Library
PML	Production Music Library
MISC	Miscellaneous
AFRTS-BC	Armed Forces Radio and Television Service Broadcast Center
X	Christmas Music
IAW	In accordance with

RESPONSIBILITIES.

All radio section personnel are responsible for knowing the steps involved in unpacking, inspecting, inventorying, cataloging, filing and accounting for AFRTS radio program materials.

The supervisor is responsible for ensuring that all steps in the inprocessing procedure are carried out correctly in accordance with station standing operating procedure and DoD Regulation 5120.20 R, APPENDIX F..

Radio personnel assigned to inprocess incoming AFRTS records must adhere to the following guidance.

1. When incoming radio materials arrive at the station or outlet, you must first unpack the shipment. Then inspect the material to ensure all items are present and not damaged. You should check the records and tapes against the packing list for accountability. Then check for damage or defects. If any of the material is damaged or defective notify AFRTS-BC directly. The notification should include disposition instructions for the damaged material. AFRTS-BC may direct the material to be returned for inspection or may authorized local destruction.

NOTE: Prompt notification is also required if more than five days have elapsed after the expected arrival date of a shipment. For circuited materials, the outlet should notify the preceding outlet as well as those following on the circuit. A limited number of copies of tapes and discs are normally held at AFRTS-BC as replacements for damaged or lost shipments. This small supply is retained for a short period of time and is then recycled. Therefore, prompt notification is essential.

2. Separate audio materials according to program type (e.g., RU, FML, RP, etc.). Artist/title cards should also be separated. You should also separate all other programming material, such as music charts, bio sheets, news letters, FML music listings, etc.
3. Separate RL materials by music type or category (e.g., W, C, P, MB, MISC, etc.). RL record covers are then labeled on both sides in both the left and right hand upper corners with the proper classification and number.

EXAMPLE:

P-24506/7

P-24506/7

To further assist announcers with selecting music, popular music covers will be color coded with a one inch centered mark along both outside edges of the record covers.

COLOR CODES:

- o Red. Albums with various artists.
- o Yellow. Albums featuring various artists with hits from the past.

The FML tapes are then filed chronologically in the program bins located in the record library. The artist/title cards are then filed alphabetically. The FM music listings are attached in chronological order to the clipboard in the library identified for that purpose.

4. Radio specials are sometimes made available by AFRTS-BC. The type and timeliness of the material will determine whether the shipment is provided on disc or tape and which outlet will receive it. Instructions for use and disposition will appear on the packing lists.
5. A supervisor's evaluation guide is provided in Annex A.

Files

The AFRTS artist/title card files are located in the record library. The chief radio announcer is responsible for ensuring the files are up to date and in order.

ANNEX A

Guide for evaluating the inprocessing procedure of AFRTS radio program shipments.

Checklist:

- 1. Unpacks incoming radio shipment.
- 2. Inspects radio materials against the packing list for accountability and for damage.
- 3. Directly notifies AFRTS-BC if any of the shipment is lost, damaged or contains defects.
- 4. Notifies preceding station and next station on the circuit.
- 5. Separates and labels program materials in accordance with SOP.
- 6. Files RL records IAW SOP.
- 7. Files FML tapes chronologically, IAW SOP.
- 8. Files artist/title cards alphabetically.
- 9. Files FM music listings IAW SOP.
- 10. Places radio materials in the appropriate location prior to airing, IAW SOP.
- 11. Processes outgoing radio materials to the next station on the circuit, if requested.
- 12. Destroys RP materials IAW DoD Regulation 5120.20 R, APPENDIX F and files destruction documents.
- 13. When authorized, locally destroys records and files destruction documents.
- 14. When authorized by AFRTS-BC degausses FM tapes to be used for other purposes within the station. If not authorized, destroys FM tapes and files destruction documents.
- 15. Provides AFRTS-BC a copy of destruction documents for items #12, #13, #14.

Approval

If required, submit the section draft procedure for approval, IAW local SOP. Make corrections as necessary and prepare the final procedure. Include the signature block of the person who authorized the procedure (you, your supervisor, network commander, station manager, etc.). Determine the number of copies needed and have the procedure reproduced. Distribute the necessary copies to section personnel and file the procedure in the section files. Provide one copy to your supervisor.

PRACTICE EXERCISE

LESSON # 2

ESTABLISH AND MAINTAIN A BROADCAST SOP

SUBCOURSE NO. DI0450

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the "T" or "F" next to each question. Compare your answers with the answer key on the next page.

- T F 1. The SOP provides information consisting of responsibilities and the procedures used to accomplish the mission.
- T F 2. The Scope section of the procedure outlines the duties of the section supervisor.
- T F 3. Instructions for ordering broadcast supplies should be part of the station SOP.
- T F 4. The procedure section should be written detailing step by step how the SOP is assembled.
- T F 5. If required, submit the section draft procedure for approval in accordance with local SOP.

**PLAN AND PRODUCE AN ELECTRONIC FIELD PRODUCTION/
TELEVISION SPOT ANNOUNCEMENT**

Subcourse Number DI0460

EDITION 9

US Army Public Affairs Proponent Center
Fort George G. Meade, Maryland

5 Credit hours

Edition Date: September 1989

SUBCOURSE OVERVIEW

This subcourse contains two lessons, giving the senior broadcaster the tools necessary to plan and produce electronic field productions and television spot announcements. These lessons will provide a general knowledge and understanding of television spot production and electronic field productions.

You must have a basic knowledge of military broadcasting prior to taking this subcourse. It is suggested you complete Army correspondence subcourses DI 0310, Techniques of Broadcast Journalism; DI 0350, Electronic Journalism; and DI 0370, Basic Television Lighting and Scenery.

This subcourse reflects the doctrine current at the time the subcourse was prepared. In your own work situation, always refer to the latest publications.

The words "he," "him," "his," and "men," when used in this publication, represent both the masculine and feminine genders unless otherwise stated.

TERMINAL LEARNING OBJECTIVE

Task: In this subcourse you will learn the duties and responsibilities of a senior broadcaster when planning and producing electronic field productions and television spot announcements.

Conditions: You are given the material presented in this lesson.

Standards: You will demonstrate a basic understanding of properly planning and producing electronic field productions and television spot announcements.

LESSON ONE

PLAN/PRODUCE AN ELECTRONIC

FIELD PRODUCTION

46R Soldier's Manual Task: 214-177-3415

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn the supervisor's responsibilities in planning and producing an electronic field production.

LEARNING OBJECTIVE:

ACTIONS: Describe the areas of responsibility in planning and producing an electronic field production.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: Define or identify the responsibilities in planning and producing an electronic field production (EFP) and plan and produce an EFP in the manner described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R-SM-TG 1/2/3/4/Broadcast Journalist Soldier's Manual and Trainer's Guide; Television Production, second edition, Wurtzel, Alan.

PLAN/PRODUCE AN ELECTRONIC FIELD PRODUCTION

INTRODUCTION

Special event programs, e.g., Armed Forces Day, German-American Volksfests and post sports championships, are produced for television at the remote location. This is: called "electronic field production" (EFP). EFP uses a wide range of production techniques, which all have one thing in common: the use of portable television production equipment. This chapter provides a basic look at planning and producing a special event program.

EFP is used when time constraints are not a problem and when higher production values and technical quality are important considerations. EFP allows you the time to properly plan for the event and to attend to all the details as though it were produced in the studio.

EQUIPMENT

Electronic field production requires a wide variety of equipment. A production crew may use equipment that is almost identical to that used by an electric news gathering crew. More complex productions may require high quality cameras, audio equipment, lighting gear and videotape recorders. A simple EFP shoot may only require loading up in a car, while a more complex shoot may call for the use of a production van (Figure 1-1, page 2).

Figure 1-1. Production Van

Cameras

The types of cameras used for an EFP will vary. High-quality shoulder-mounted cameras (Figure 1-2, page 3) are the norm. They offer a great deal of mobility and flexibility, which can come in handy during a special-event production. Accessories such as special lenses, filters and collapsible dollies, in addition to tripods and shoulder mounts, are also used.

Figure 1-2. EFP Camera

Before you actually shoot, several equipment limitations must be considered. Low or high light levels in the shooting environment adversely affect camera/recorder operations. Extreme temperature changes will also affect equipment operations. All video equipment is fragile. Handle the equipment with care, and don't expose it to sand, salt, heavy rain, etc.

Army correspondence subcourse DI 0350, Electronic Journalism, will provide you with a basic knowledge of EFP cameras.

Audio

Audio needs will vary according to the special event. Simple productions may require a hand-held or lavalier microphone (mike), while a more elaborate production will involve boom and wireless microphones.

Hand-held and lavalier microphones are normally used in situations where an on-camera microphone is acceptable. Shotgun mikes and fishpole boom microphones are used so as not to be seen.

Wireless microphones are becoming more common on EFP shoots because of their versatility. The wireless microphone produces excellent sound quality and avoids the problems associated with trailing cable or a need for off-camera boom mikes.

Elaborate EFP shoots may use multiple mikes. In this case, you'll need a sound mixer, preferably battery powered, that allows you to balance and mix a number of microphones simultaneously.

EFP audio requirements should include extra mike cables, gaffer tape, and headphones for monitoring audio pickup, spare batteries, fuses and windscreens for the microphones.

Video Tape Recorders

Electronic field productions are videotaped for editing later during postproduction. The most common videotape recorder (VTR) used for an EFP is the 3/4 inch format (Figure 1-3, page 4). However, the 1/2 inch camcorder, a single system camera/recorder, is fast becoming the most popular choice for electronic field productions. The 1/2 inch camcorder is smaller, lighter, and offers flexible production capability.

Figure 1-3. 3/4 Inch Format

Lighting

Television cameras will not produce quality pictures without proper lighting. Television lighting is an art in itself. Proper lighting can create certain moods and effects. EFP often requires that proper lighting be set up to control illumination and to create whatever lighting effects are needed.

EFP shoots will normally require lensless spotlights, floodlights, mounting devices (stands, wall units), barndoors, screens, gels, and sufficient amounts of electric powercable. Army correspondence subcourse DI 0370, Basic Television Lighting and Scenery, will provide you with an understanding of the fundamental techniques of lighting, lighting equipment and the three-point lighting method.

Assess Need

Prior to committing to produce any special event program, you have to assess the need for your intended product. Generally, input on whether to produce a new project comes from station management. There are times, though, when you'll receive input from the local public affairs officer, commanders of units you serve and leaders of community organizations.

Identify Objective and Target Audience

Once you've assessed the need for the broadcast, the next step is to determine your objective.

- o What is your goal? Is the EFP to inform, educate or entertain?
- o Whom do you want to reach and why do you want to reach them?
- o Is there more than one audience?

Finally, write a concise statement, e.g. "The objective of this program is to inform the military community about the many exciting areas to travel throughout Europe."

Once this process is completed, you'll know your audience and what you have to accomplish. By identifying the direction this program will take, you have a basis on which to begin the EFP project.

Formulate Ideas and Research

Up to this point, we have determined there is a need for this project, and identified our objective and target audience. The next step in the process is to formulate ideas and do research. This is the point where you'll need to bring in some of the principal players, i.e. the director and the writers. In some cases, you might be the producer, director and the writer of the entire production. It all depends on the size and nature of your EFP.

Gather all the information you can about the special event. You can never do enough research. Meet with the director and writers, go over the information and brainstorm ideas about how to present the special event on television. A brainstorming session stimulates creativity. One person might bring up a good idea and another will improve on it with ideas of his own. Write down everything you talk

about. Once the list of ideas has been compiled, narrow it down until you and the group come up with the direction to take. As producer of the EFP you have the final say, but by including other players on the project in the decision-making process, you already create an atmosphere of teamwork.

Write the Script

Write a script, if necessary, focusing on one, central theme of the special event. Make sure the lead attracts the viewer's attention. Use colorful language to avoid just telling the viewer what is happening. Keep the viewer involved in the program by maintaining his interest. Draw your ideas out on storyboards. This helps you visualize how you want your program to appear. It will also help in expressing your ideas to others involved in the EFP project. Army correspondence subcourse DI 0310, Techniques of Broadcast Journalism, will provide you the basics of broadcast script writing.

Reviewing Materials for Broadcast Release

One of the most important responsibilities you will have as a producer is to review materials for broadcast release. Once a product airs, it can't be retrieved. Local SOPs should provide basic guidance when it comes to release of material for broadcast.

All broadcast products aired must conform to **SECURITY, ACCURACY, POLICY** and **PROPRIETY**. Security measures for the Army are outlined in AR 380-5. Disclosure of classified information definitely violates this regulation. This would include any visual of areas or equipment that are classified. Always check first when in doubt on a shoot. Also, comments that are sensitive (but not classified) should not air. An example of this would be a missile crewman who proudly announces that it "only takes his crew 15 minutes to set up and fire from a field location." The comment is not classified but could be helpful to an enemy or potential enemy.

Information contained in the broadcast product must be accurate. Check the spelling of names; make sure the ranks are correct and unit designations are correct (e.g., there are batteries not companies in field artillery), etc. Even stories that are generated and released by the PAO should be checked for accuracy.

Privacy Act

The Privacy Act prevents us from broadcasting certain information about an individual without that persons permission. This includes street addresses, social security numbers, telephone numbers, information contained in medical and personnel files, and information pertaining to on-going disciplinary actions that would clearly be an unwarranted invasion of personal privacy.

Libel

Material containing information considered libelous must be deleted from a program intended for broadcast. If this is not possible, the program will have to be replaced with a backup. You may not say anything about persons, groups, organizations or businesses that exposes them to hatred or contempt, lowers them in the esteem of others, causes them to be shunned, or injures their business. Some libelous words are:

“drunk, radical, dishonest, unethical, a cheat, criminal (unless convicted), traitor,” etc.

Propriety

Propriety is doing what is right and proper. You must ensure broadcast material is in good taste and does not violate the sensitivities of the listening/viewing audience. There are several types of material that would prevent a program from being aired: vulgarity, obscenity, gore, perversion and excessive violence.

Regulations

As the program producer, it is essential that you be familiar with public affairs policy. Two regulations that you must have a good understanding of are AR 360-5, Army Public Affairs Public Information, and AR 360-81, Command Information Program. In addition, the broadcast supervisor must be familiar with AR 340-17, Release of Information from Army Files and Records; AR 360-80, Release of Information When More Than One Service is Involved in Accidents or Incidents; AR 380-5, Department of The Army Information Security Program; DoD Directive 5122.10, American Forces Information Service; and AR 360-7, Army Broadcast Service.

PREPRODUCTION PLANNING

Site Selection

Where will you shoot your EFP? For example, certain field productions such as changes of command and sporting events make it imperative that you shoot at those locations. While others, such as a command information spot announcement, require a search for the ideal area to fit in with the intended message of your production. Later in this lesson we'll discuss conducting location surveys. This will give you further ideas on what to look for prior to selecting a site.

Talent Selection

When selecting on-camera and voice-over personalities for the EFP, ensure that the talent meet the needs of the production. Are they able to convey the intended message effectively? Often, producers grab the nearest broadcaster and assign him to a production. The voice and appearance of the announcer play an important part in any production. A monotone announcer would not exactly motivate an audience to go out and do what you're trying to entice them to do. To sell an idea, the announcer must have an on-air presence and a voice that can get people excited about your message. As far as appearance, you wouldn't want an overweight broadcaster trying to sell fitness in a spot production. Your production would lose all its credibility.

Crew Selection

Finding the right people to fill out your production crew is sometimes a difficult process. Personnel may be assigned to different projects and unable to assist you. In the military, we have to take into account leaves, work schedules and other duty requirements. Crew selection should start as soon as possible to ensure the people you want are available.

Final Script Approval

Ensure the script has been circulated to all the departments involved for comments and suggestions. Incorporate the feedback and send the script through the proper channels for final approval. The script might have to be approved by the

program director, station manager, public affairs officer, or even the local commander. Don't let the chain of command be surprised by the content of your production. Keep the lines of communication open to avoid possibly embarrassing situations.

TRANSPORTATION

Believe it or not, transportation arrangements often are not made until right before the event. You must include this in your preproduction planning. When considering your transportation needs, look at:

- o number of personnel.
- o amount of equipment.
- o type of vehicle required.
- o arrangements for fuel (coupons, money, interservice agreements for refueling, etc).
- o where you're getting the transportation (motorpool, renting).
- o who will service the vehicle if it breaks down en route. If it does, will you be able to get a replacement sent out to your crew?

FOOD AND LODGING

If you want to end up on the bad side of your crewmembers, then overlook arrangements for food and lodging. A well-fed, comfortable crew will give you maximum output when working on the production. If your crew is going to require lodging, reservations should be made well in advance. Once the reservations are made, it doesn't hurt to call and verify that you do indeed have lodging space reserved.

Handling meals for your crew can sometimes be a problem. If your crewmembers are on TDY, they will receive reimbursement for their meals. The problem is not money for the meals, but where to eat. Sometimes an EFP may take place in a location where meals are not readily available. You must be aware of this possibility. Finding out at lunch time that there is nowhere to eat could really put you in a bind. Make arrangements for sack lunches or field rations. Your dining facility NCOIC should be able to help you out.

You've selected the EFP site, the talent and the crew, and the final script has been seen and approved by the chain of command. Now it's time to assemble all the elements of your EFP.

Start by having a preproduction conference. At this meeting require all the people involved to be present. Brief your staff on the upcoming EFP. Present them with all the information you have concerning the project. Pass out assignments, production schedules and any other materials necessary to assist the staff in performing its duties.

Once the staff has been fully briefed, open the meeting for discussion. Encourage an exchange of ideas and be receptive. Chances are, you'll get some great ideas for improving the EFP.

SHOOTING ON LOCATION

Why shoot on location? There are advantages and disadvantages of shooting from a remote location. You have to weigh them carefully.

Shooting from the location offers:

- o realism, detail, proper atmosphere,
- o no set designing
- o and authenticity.

Shooting from the studio offers:

- o safety and comfort,
- o better control of the production,
- o sound and weatherproofing,
- o a light-tight environment,
- o more equipment, electrical power and physical space,
- o heating and air conditioning
- o and restrooms and telephones.

Studio production also allows for more careful, detailed planning and coordination. Remember, when shooting from the remote location, you're always subject to noise, weather and difficulties that are grouped under Murphy's Law, "Whatever can go wrong, will go wrong when you least expect

it." In conducting a site survey, your main purpose is to determine the personnel and equipment that will be needed, but there is much more that you'll need to find out on your site survey.

Conduct a Site Survey

When conducting your site survey, ensure that you visit the site at the same time of day the event is scheduled to take place. For instance, if you survey the site in the evening, you may find that the parking lot has ample space for parking and equipment. That same location, during the day, can look quite different, with the parking lot full and the streets crowded with pedestrians and traffic.

Establish a point of contact at the location. You'll need assistance in obtaining access and information, and in getting help with various location details.

Take nothing for granted during your site survey.

- o Do the electric outlets actually work?
- o Will the window you need to run a cable through open?
- o Are there elevators and will you be able to use them to transport equipment?

You will also need to determine:

- o camera locations. Place the cameras so the sun will be behind them. Sketch the camera locations and make cable diagrams.
- o lighting needs. Take a light meter along on the survey. As pointed out earlier in this lesson, cameras must have proper lighting to operate. Sketch a diagram of where you want to place the lights. Doing this allows you to move equipment to the approximate location and set up quickly.
- o audio needs. What type of microphones will you be using? Does this shoot require hidden microphones or will they be visible on camera? As with the cameras and lights, make a sketch of where the microphones and cables will be placed.

- o power requirements. Have a station engineer present to check out your electrical needs. If not, you will need to estimate the production's total power requirements and ensure the necessary power is available. Note the voltage and amperage and make sure the wiring configuration is compatible with your equipment. Locate the fuse box or circuit, breaker box and spread out your electrical load evenly by plugging into several outlets wired to different circuits. One important thing to avoid is laying electric cables near video or audio lines, this can cause electrical interference. Checking power requirements is quite technical, that's why having a station engineer present is a necessity.
- o what permits and clearances are required. Will there be a need for parking permits? Are special credentials and passes needed to enter the EFP location?
- o alternate plans. What happens if the weather fails to cooperate? If the location is outdoors, will you cancel or go on with the broadcast? Are you prepared for the sudden illness of a crewmember? Try to come up with every possible scenario that could hinder or cancel your production effort. Once you've listed all possible problem areas, discuss them with your staff and formulate alternate plans. As a boy scout would say, "Be prepared."
- o how to publicize the event. Publicize the air date of your EFP on television and radio. Have talent do promos at the EFP location to lend credibility to the program. Contact the public affairs office for coverage in the post newspaper.

SHOOT THE SCENES

The day of the EFP has arrived, the script has been finalized, the crew selected, the site surveyed and all possible production problems taken into account. The time has come to shoot the product.

Ensure that the entire crew is familiar with what the script calls for. Continuity will play a big part in your production. Costumes, uniforms and the positions of talent and props have to be closely monitored. For instance, in the first shot the on-camera personality is wearing a hat, but in the next shot, which is part of the same scene, the hat is missing. The viewer will catch this and probably spend the rest of the program wondering what happened to the hat. The same goes for the location of props. From time to time you may have noticed on television or in the movies,

that a prop mysteriously moves or disappears during a scene. One shot of the scene might have been completed, the crew took a break, and someone unintentionally, without thinking, removed or moved a prop. Monitor the

continuity of each shot in a scene. Failure to do so could be embarrassing and cause a return to the location to reshoot one particular camera shot.

As you shoot, slate each scene and log good and bad takes to save postproduction time.

POSTPRODUCTION EDITING

Prior to getting to the postproduction stage, you should have already scheduled the necessary facilities for putting your program together. Schedule the facilities as far in advance as possible. Chances are you'll be working on a tight schedule to complete the EFP, so planning is extremely important. If you need a refresher on editing procedures, read Army subcourse DI 0350, Electronic Journalism. DI 0390, Television Graphics For Broadcast Journalists, will assist you in planning and designing graphics.

EVALUATE PROGRAM

Evaluate the program once it has aired. Gather feedback from your station peers and from the viewers. This can be done in several ways: by telephone, written surveys, person-to-person interviews, etc,. Feedback will provide you with a feel for what you did well and what failed to work during your production.

Write an after-action report detailing the production process from beginning to end. Make this document a part of the program file for your EFP. The next time you or another staff member has a similar EFP assignment, the program file of your EFP will make a great starting point.

SAFETY

With any production using electrical equipment, it is always wise to follow safety precautions set forth in the manufacturer's and in your outlet's standing operating procedures.

PLAN/PRODUCE AN ELECTRONIC FIELD PRODUCTION

INSTRUCTIONS:

Review the material in this lesson. Answer the questions below by circling the " T" or "F" next to each question. Compare your answers with the answer key on the next page.

- | | | | |
|---|---|-----|---|
| T | F | 1. | Once you've assessed the need for an EFP, the next step is to determine your objective. |
| T | F | 2. | Brainstorming sessions with production crew members are generally not very productive. |
| T | F | 3. | EFP is used when there are time constraints and when lower production values and technical quality are not important considerations. |
| T | F | 4. | When conducting a site survey, it is extremely important that you visit the proposed site at the same time of day the event is scheduled to take place. |
| T | F | 5. | An EFP normally requires that high-quality studio cameras be used. |
| T | F | 6. | Scriptwriters frequently draw their ideas out on storyboards to help visualize how they want the program to appear. |
| T | F | 7. | A light meter is seldom used to check lighting for an outdoor production. |
| T | F | 8. | Shooting from the location offers realism, detail and better control of the production. |
| T | F | 9. | When writing a script, use colorful language to avoid just telling the viewer what is happening. |
| T | F | 10. | The 3/4 inch format is fast becoming the popular choice for electronic field production. |

LESSON TWO

PLAN/PRODUCE TELEVISION SPOT ANNOUNCEMENTS

46R Soldier's Manual Task: 214-177-2351

OVERVIEW

TASK DESCRIPTION:

In this lesson you will learn the supervisor's responsibilities in planning and producing television spot announcements.

LEARNING OBJECTIVE:

ACTIONS: Describe the areas of responsibility in planning and producing a television spot announcement.

CONDITIONS: You are given the material presented in this lesson.

STANDARDS: Define or identify the responsibilities in planning and producing television spot announcements, and plan and produce a television spot announcement in the manner described in this lesson.

REFERENCES: The material contained in this lesson was derived from the following publications:

STP 46-46R-SM-TG 1/2/3/4/Broadcast Journalist
Soldier's Manual and Trainer's Guide;
Television Production, second edition, Wurtzel,
Alan.

PLAN/PRODUCE TELEVISION SPOT ANNOUNCEMENTS

INTRODUCTION

Of all the communication tools available to you in military television, the spot announcement is the most common. Unlike the feature, which is normally aired only once, the television spot will be used over and over again.

A civilian media spot is normally thought of as a commercial, something that sells a product. The TV spot can do more. It can sell a person on an organization, activity or even a mood. A TV spot can do all this without ever asking the audience to spend money on a commercial product. Many programs or activities in a military community are brought to the audience's attention in this manner.

In this lesson we'll discuss the types and forms of spots, the mechanics of spot writing and producing your television spot announcement.

TYPES OF SPOT ANNOUNCEMENTS

There are two types of spot announcements used in military broadcast media. These are:

- o command information spots
- o public service announcements

Command Information Spots

Command information spots support the commander's information goals. These areas are normally handled for the commander by the public affairs officer (PAO). Coordinating with other command agencies, the PAO establishes a campaign to emphasize the commander's information goals. For example, the PAO may work closely with the post engineer to determine energy saving campaigns for the calendar year, or the safety officer might suggest a series of spots promoting swimming safety. While most of this information can be included in community and unit newspapers, bulletins or in commander's calls, most soldiers, like the rest of the world, use television as their primary source of information. Using information gathered from the PAO, the station's traffic and continuity department compiles a command information calendar. This document is

Public Service Announcements

The public service announcement (PSA) is the most common type of spot presented on military television. The PSA provides information the audience wants to know, rather than needs to know. Some examples of a PSA are: information on travel, social announcements or fund-raising activities.

FORMS OF SPOT WRITING

There are two forms of spot writing: selling and information.

Selling

The most common method of broadcast spot writing is the selling form. The selling form is the most demanding because it requires you to use your imagination to come up with unique material.

The selling form includes an action step. This is a point of motivation. The selling spot encourages the audience to take action, not just retain a piece of information. You can sell throughout the spot. The action step is your last effort to get the viewer or listener to do what you want him to do.

Information

The information form is not as overt in its intentions as the selling spot. In the selling spot you actively encourage your audience to go out and do something or buy something. In the information form, you want to convey your facts in such a way that the audience will retain them, but you do not include the action step.

WRITING STEPS

To write an effective spot, there are three steps you must use. These are:

- o attention step
- o appeal step
- o action step

Attention Step

All forms of broadcast writing require you to first gain the audience's attention. This is called the attention step, or "hook." The object is to quickly gain the audience's interest. Most spots are: 30 and : 60 seconds in length. For example, **"YOU ARE SLOWLY COMMITTING SUICIDE."** could be the attention step for an anti-smoking spot.

The attention step in broadcast spot writing can include startling statistics, a jarring question, as in the example above, or a startling fact. Use the most appropriate opening to reach the audience as quickly as possible.

Appeal Step

To motivate your audience, use the appeal step. This is the body of the spot. During the appeal step you list all the reasons your audience should buy your product or become interested in your idea. Appeal steps in the anti-smoking spot could be:

- o You'll stop coughing.
- o You'll feel better.
- o You won't run out of breath so quickly.
- o Your clothes won't smell smoky anymore.
- o Non-smokers won't avoid you.

Action Step

The final step in the selling method is the action step. Using six words or less, the action step suggests your audience should go into action and buy whatever it is you are trying to sell. This step should be forceful,

combining invitation and demand, and should compel the audience to buy, join, write or perform according to the action you have suggested. The action step of the anti-smoking spot could be, **"FOR A LONGER LIFE, STOP SMOKING."**

MECHANICS OF SPOT WRITING

Target Audience

Spots are geared to attract all kinds of people, young and old, men and women, active duty and family members. However, each spot is not aimed at all of these groups, but at a small portion of the overall audience. It is your job as the spot writer to target your spot to that select group. For instance, if your spot were on the local day care center, your target audience would be married soldiers with working spouses or sole parents.

There are several questions you need to ask yourself:

- o Is this spot needed?
- o How do I reach this segment of the audience?

Since the target audience is probably not home during the day, nighttime television might be the best medium to air your spot. **Never** guess about the viewing habits of the audience. Your station's audience surveys will provide you with the information necessary to help you reach the intended audience. Once you've determined your target audience, write a specific spot announcement objective to include the purpose of the spot. This statement provides you with the direction in which this spot must go to serve the audience. Too many times folks working with the AFRTS (Armed Forces Radio and Television Service) have the old, "I'm the only station in town" attitude. Just because you're the only station in town, doesn't mean the audience is tuned in.

Prior to writing the spot, you must decide how you are going to package your finished product. A television spot might be produced in the studio, with actors and sets, or it might be shot at a remote location, with limited equipment.

WRITING THE SPOT

Verb Tense

Write your spot in the active voice, using either the present or the present perfect tense. It's better to say, "Show pride in your uniform," rather than, "You have shown pride."

Pronouns

Your spot should be conversational. Personalize your message as though you were speaking to one person. Remember, your spot must have appeal to the broad-based target audience, but it must seem as though you're talking to each viewer at home.

The best pronoun is YOU. The word **YOU** always makes the audience feel as though you are talking to them. "For more information, **you** can call Jane at 5259" or "How often do you think about retirement," are directed at the individual.

Sentence Length

Always use short sentences when spot writing. Sentences should vary in length to avoid monotony, but should be no more than 17 words.

Word Usage

Hard to pronounce words that give an announcer trouble, should be avoided, if possible. Avoid using military jargon, acronyms or sayings that might confuse the audience.

USE	INSTEAD OF
Post Exchange	PX
Commander	CO
12 Noon	1200 hours
Specialist John Jones	SPC Jones
Ambulance	Emergency Transport Vehicle

DI0460

22

Format

Your spot will be inserted into the program day, so it is extremely important to meet the time requirements. If the spot request calls for a :60 second spot, then it should be :60 seconds. Follow the time guidelines. Taking the liberty to make your spot :32 seconds can cause serious problems.

For instance, in television a spot that runs long might cause the on-air switcher to run late into a network or satellite broadcast.

When writing for television, remember that your audio must stand alone. The television audience may not always be actually watching the set, so it's important that the words stand by themselves. The video used in your spot production should complement the audio. If you use music with the spot, make sure it enhances the spot message. The same applies to music with lyrics. It must enhance or support the message, not distract from it. The use of sound effects falls under the same guidelines as music and lyrics. The video that you select must support the audio. The principle that video complements audio is the central theme of writing for television.

Writing Style

As in all broadcast writing, there are steps you should follow in writing a spot.

- o Use the six C's of broadcast writing. Clear, Concise, Correct, Conversational, Complete and Current.
- o Use contractions whenever possible.
- o Television copy must be divided vertically, with video scripting on the left of the page and audio on the right.
- o Repeat numbers and addresses in your copy. These are hard to remember, so give your audience a second chance.
- o Always double space your copy and triple space between scenes. When in doubt, follow your station's format.
- o Use proper punctuation.
- o Make sure your copy is accurate. Always check and double check your facts, especially numbers and times.
- o Most spot writers work with deadlines. If given a deadline, meet it.

Policy and Regulation

All spots must conform to the Army's Public Affairs policies and regulations. These regulations are listed on Page 7, Paragraph 4 of Chapter 1 of this lesson.

WRITING EXAMPLE

Now that we've discussed the mechanics of spot writing, let's take a look at an example of a television spot.

GOODWILL AMBASSADOR

May 28, 1992

ANNOUNCER ON CAMERA

WHEN YOU'RE IN PUBLIC, REMEMBER YOU
ARE A GOODWILL AMBASSADOR OF THE
UNITED STATES.

###

THE SPOT REQUEST

We've gone over the mechanics of spot writing, now let's take a look at handling an incoming request for a television spot announcement.

When given a new request, the first thing to do is read it over thoroughly to become familiar with the background information. If the request does not contain the essential information (who, what, when, where, why and how), contact the requester. You'll also need to:

- o give the script to your supervisor for approval.
- o make any corrections that are needed.
- o re-time the script, if you make corrections, to ensure it meets the time requirement.
- o meet with all the personnel involved in the production to ensure each person knows what is expected of him.
- o rehearse the spot. If there are problems, go over them with the crew and rehearse until you are satisfied all problems have been resolved.
- o ensure that prior to shooting the final product, all talent is well groomed in accordance with specific service regulations or local standing operating procedure (SOP).

How you shoot the final product may depend upon your local SOP. Generally, a slug slate is recorded in front of the final product. This is an information slate placed in front of the countdown leader. It usually includes spot title, date, number, length, start date and kill date. Again, this will depend on the local SOP. Slug slates are normally put together on a character generator. You, as the producer of the spot, should provide the needed information to master control personnel.

After the slug slate, make sure a countdown leader is recorded. Your next step is to record the final product. You may have to shoot it several times to get the video shots you want. Once shooting is completed, then you enter the electronic editing phase. DI 0350, Electronic Journalism will provide you with the basics of electronic editing.

Frequently, the subject of a television spot will require a remote location. Lesson 1, Electronic Field Production, will assist you in producing your spot at a remote location.

GLOSSARY

Audio: The sound portion of a radio or television program.

Audio level: The strength of the audio signal.

Audio mix: Balancing all audio levels to provide the desired composite sound.

Barndoors: Metal flaps, mounted on lighting instruments, that are used to control light distribution.

Dolly: A camera support that permits a camera to smoothly move across the floor of the studio.

Filter: A lens cover, made of glass or gelatin, that is used to change the quality of light entering a camera.

Fishpole boom: Hand-held and used mainly on location, where a larger boom is too unwieldy.

Floodlight: A wide-aperture light source that produces flat, diffused illumination, over a wide area.

Gel: Colored plastic or gelatin material, mounted in front of lighting instruments, to produce colored light.

Lavalier microphone: A tiny microphone, worn by talent, clipped to the tie, lapel or blouse, or hung from a cord.

Level: The volume or signal strength of an audio or video level.

Light meter: An instrument designed to read light intensity, using either incident or reflected light.

Location: A production area located outside the normal studio.

Master control: The operations area where all audio and video outputs of various production studios are sent for distribution and broadcast or recording.

Remote: A radio or television production produced outside the studio.

Shotgun microphone: A highly directional microphone designed to pick up audio from great mike-to-subject distances.

Spotlight: An instrument that produces a hard, directional, intense beam of light.

Storyboards: Sketches of important visual sequences of a script that help illustrate the writer's concept.

Tripod: Three-legged camera mount that can be attached to a dolly for maneuverability. Normally, tripods are lightweight and are used for remote productions.

Wireless microphone: Transmits a low-power signal that permits cable-free operation.

SCRIPT WRITING FOR EDUCATIONAL
VISUAL INFORMATION PROGRAMS
(Development Date: 30 June 1988)

SUBCOURSE NO: SS0519-8

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

2 Credit Hours

GENERAL

Script Writing for Educational Visual Information Program is designed to teach the principles and knowledges necessary to perform tasks related to writing techniques in the visual information field. Information is provided for several tasks at increasing levels of difficulty at skill levels 1, 2, and 3.

The subcourse is presented in three lessons. Each lesson corresponds to a learning objectives as listed below.

Lesson 1: PREPARE A VISUAL INFORMATION SCRIPT

TASK: Define the elements of research techniques, training objectives and their application to an audience, the basic procedures for writing outlines, and the three approaches used to develop a visual information or screen treatment.

CONDITIONS: Given information and illustrations relating to the elements, objectives, applications, procedures, and approaches used to develop a visual information or screen treatment.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test covering definitions of the elements, objectives, applications, procedures, and approaches used to develop a visual information screen treatment.

LESSON 2: DESCRIBE THE PRINCIPLES OF SCRIPT WRITING

TASK: Define and identify the principles of visual information script writing (audio and video), and the various camera movements that support a presentation.

CONDITIONS: Given information and illustrations relating to the principles of visual information script writing and camera movements.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test concerning definitions and the principles of visual information script writing and camera movements.

Lesson 3: PREPARE A STORYBOARD AND A FINAL SCRIPT

TASK: Define and identify the procedures used for storyboard layout and the format and how it leads to final script development.

CONDITIONS: Given information and illustrations relating to the procedures and format for a storyboard layout and for development of a final script.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test concerning procedures and format for a storyboard and development of a final script.

The objectives of this subcourse support the tasks in STP 11-25P13-SM-TG, scheduled for publication in FY90, as follows:

- 113-577-1058 Set Up Audio For a Presentation (Studio or Remote)
- 113-577-1059 Set Up Lights For a Presentation (Studio or Remote)
- 113-577-1061 Set Up or Assemble Studio or Remote Site For A Presentation
- 113-577-1064 Prepare a Scene Breakdown Sheet for Controlled Action Photography
- 113-577-1067 Determine Graphic Requirements For a Motion Media Production
- 113-577-1068 Determine Special Effects Requirements for a Motion Media Production
- 113-577-4036 Operate a Television or Motion Picture Studio Camera Mounted on a Pedestal, Tripod or Dolly

INTRODUCTION TO SCRIPT WRITING FOR EDUCATIONAL VISUAL INFORMATION PROGRAMS

There is no doubt that writing an educational visual information script is a creative process. It is an extension of its author; therefore, as you write your script, it is important that you develop in yourself some of the characteristics of a creative person.

Try to look at things differently. Ideas stem, primarily, from looking at one thing and seeing another. Ideas also come from experimentation; mixing various media techniques to achieve a new approach to script writing is one way to experiment. Probably the most important characteristic of the creative person is fearlessness. Don't be afraid to try anything that your best judgment says might work, then have the perseverance to see it through. When others pass judgment on your script, don't be defensive. Use their comments to better your script.

Although this course is designed to teach script writing for the visual media in general, it will use the television medium as the example to present various principles of script writing. By using specific examples, rather than speaking in generalities, the subject matter is easily understood. This knowledge can then be applied to other visual information programs.

The majority of the script writing you do will be used for briefings and training programs (exceptions being public affairs personnel). Again, the principles are the same; if you learn all the principles for educational script writing, you can easily transfer these principles to other applications.

CREDIT: Credit is extended to the Defense Information School, Fort Benjamin Harrison, for use of some of their instructional material on script writing.

LESSON 1
PREPARE A VISUAL INFORMATION SCRIPT

TASK

Define the elements of research techniques, training objectives and their application to an audience, the basic procedures for writing outlines, and the three approaches used to develop a visual information or screen treatment.

CONDITIONS

Given information and illustrations relating to the elements, objectives, applications, procedures, and approaches used to develop a visual information or screen treatment.

STANDARDS

Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test covering definitions of the elements, objectives, applications, procedures, and approaches used to develop a visual information screen treatment.

FM 25-3

Learning Event 1:
DEFINE BASIC RESEARCH TECHNIQUES

1. Before you do any work on the script itself, you may need to research the subject area more thoroughly. Visual information programs, especially television, are not easily updated; so it is important that all your information is up-to-date. You will need to gather materials and information and research the subject. Researching the subject consists of two steps:

a. Locate as many instructional materials relevant to the training objective as practical. Most material that exists in an instructional format will more than likely be technically accurate and possibly even be validated as an effective training lesson. These materials may not have been designed for classroom use, but they should have some potential as instructional aids. Some examples where reference material may be found are:

- (1) Field and Technical Manuals (FMs and TMs)
- (2) DA Pamphlets
- (3) Training Circulars (TCs)
- (4) Extension Training Courses
- (5) TEC Lessons
- (6) Subject Matter Experts (SMEs)
- (7) Commercial texts
- (8) Manufacturer's materials

b. Observe copyright law requirements particularly when using commercial texts or manufacturer's materials which may be copyrighted.

NOTE:

Other sister services may have manuals, films, and extension courses which may be usable. Currently, Department of Defense is developing a computer system that lists all visual information material. The system, called Department of Defense Audiovisual Information System (DAVIS), will be available through the local Training and Audiovisual Support Centers (TASC).

2. Evaluate the material. The worth of any instructional material is its effectiveness with students. Evaluate the material on the basis of validity and technical accuracies. Look for ideas you can use in your script. You are not only evaluating the material to ensure technical accuracy, but you are determining the appropriateness of the material to the training objective.

Learning Event 2:

DEFINE TRAINING OBJECTIVES

1. The design and development of the course of instruction follows systematic procedures. The Systems Approach to Training (SAT) model adapted by the military services for the development of their courses, contains the philosophy as well as the procedures used to develop lessons required to conduct a course of instruction (Read TRADOC Pamphlet 351 series.). This means that in developing a lesson (or a script) you must ensure that it fits into the total training program.

NOTE:

There will be times when you will have to develop scripts for a general audience which do not fit into any specific course of instruction; in this case the mechanics of script writing will still apply.

2. Writing a script for the educational visual information program requires that there be some purpose behind it; we should be training individuals to do something. This is commonly referred to as the performance approach to training and it begins with the TRAINING OBJECTIVE. For a

given skill, a properly structured and complete training objective is both the training and the test.

a. A properly constructed training objective consists of three elements:

- (1) Task to be performed.
- (2) Conditions of performance.
- (3) Standard of acceptable performance.

b. A complete training objective answers three questions:

- (1) What skill do you want the student to acquire?
- (2) Under what conditions do you want the student to demonstrate this skill?
- (3) How well do you expect the student to perform the standard?

3. Let's take an example of a training objective. A commander is concerned with the ability of his NCOs to navigate cross-country using a map and compass. A common practice has been to write an objective as follows:

"To ensure that the NCO is proficient in the use of map and compass in cross-country navigation."

a. A performance objective should read as follows:

TASK:	Each NCO will navigate cross-country.
CONDITION:	On foot, in daylight, for 5000 meters, over woody and hilly terrain, given a Lensatic compass and a 1:50,000 map which shows both the starting and finishing point.
STANDARD:	NCO must arrive within 250 meters of the objective in 3 hours or less.

b. Notice that a performance objective consists of specific terms that tell exactly what is to be done under specific conditions and to a specific standard. To learn how to write good training objectives, refer to FM 25-2, Unit Training Management or FM 25-3, Training in Units. The following tables, however, summarize the requirements of good training objectives.

The three parts of a well-stated learning objective		
CONDITIONS (INPUT)	PERFORMANCE BEHAVIOR(S) (ACTION)	STANDARD(S) (OUTPUT)
Description of the condition(s) of performance - what is presented	Description of the action or behavior - what the student is expected to do	A statement of the output or outcome of the performance and the standard(s) of performance

Table 1-1.

How to write the three parts of an objective		
TO WRITE CONDITIONS, SPECIFY WHAT STUDENT IS GIVEN	TO WRITE PERFORMANCE/ BEHAVIORS, SPECIFY WHAT STUDENT DOES	TO WRITE STANDARDS SPECIFY OUTPUT (OR) HOW WELL IT IS DONE
<p>INPUT(S) Include:</p> <p>Job Aids Equipment Technical references</p> <p>Special tools</p> <p>Environmental conditions</p> <p>Special instructions</p> <p>Signals, symbols</p> <p>Problem situations or contingencies</p>	<p>Use ACTION verbs that are:</p> <p>Observable Measurable Verifiable</p> <p>Reliable (not prone to varying interpretation)</p>	<p>OUTPUTS AND STANDARDS</p> <p>Criteria for standards: Completeness Accuracy</p> <p>Types of Standards:</p> <p>Standard Operating Procedures (SOP)</p> <p>No error</p> <p>Amount of supervision</p> <p>Qualitative indices</p>

Table 1-2.

Examples of suitable verbs for each of four types of objectives			
INFORMATION	MENTAL SKILL	PHYSICAL SKILL	ATTITUDE
State Name Recite Describe	Demonstrate Discriminate Classify Generate (a solution)	Execute Operate Repair Adjust	Choose Volunteer Allow Recommend
List Relate Tell Write Express Recount	Apply (a rule) Solve Derive Prove Analyze Evaluate	Manipulate Handle Manipulate Calibrate Remove Replace	Defend Endorse Defend Accept Decide to agree

Table 1-3.

4. In developing the objectives for your script you must keep one important thing in mind - the audience at which your program will be directed. These are the people who will be using and learning from your material. You must take a close look at audience characteristics such as age and educational level, knowledge of the subject and attitude toward it, and individual differences within the group. All these areas have a bearing on the objective you develop. The audience is the determining factor when you consider the complexity of ideas to be presented. For example, you wouldn't develop a college level program if the majority of your audience hasn't finished high school. The audience also affects the rate at which the topic is developed, and the vocabulary level used for captions and narration. For example, you might not need as much repetition and summaries of key points with an audience consisting of experienced soldiers as you would with fresh recruits.

5. The following is an example of an objective developed according to the material just covered. This objective will also be used to develop the rest of the material required to write a script.

COURSE OBJECTIVE

Intended audience: Signal School students in a radio operators course.

Action: The student will

Conditions: Given a broken whip antenna, a 3-foot stick, tape, 3 feet of WD-1 wire.

Standard: The antenna must be operational within 15 minutes.

6. In summary, the training objective you develop should consist of four parts: the intended audience, the task (action), the condition, and the standards.

7. One final point to remember when using performance-oriented objectives in training with television: since the training objectives will determine the test objectives, there are some tasks that you would not expect the student to perform just by seeing it done on a screen. You would probably require the student to have some practice training before he is tested. This ties in to what we said before - the script must fit in with the over-all scheme of the training program.

Learning Event 3:

IDENTIFY THE BASIC PROCEDURES FOR WRITING AN OUTLINE

1. Up to this point you have been researching your subject, writing the objectives, and defining the audience. From this background work, you are now able to prepare your content outline. This outline becomes the framework for your materials. It consists of the basic topics which support your objectives and the factual information that explains each topic.

a. Remember the people who will be your audience their interests and their limitations. Decide what information must be included in detail, what can be treated lightly, what you can suggest for additional study, and what should be left out or considered for other visual information materials.

b. A good way of relating content to objectives is to connect the two visually. Write each objective on a 5- by 8-inch card. Make a second set of cards listing the content, the factual information related to each objective and display these cards under each appropriate objective card. At this stage, list all the available content relating to the objectives, without considering what you may use and what will be discarded. It is advisable to use cards of one color for objectives and of a second color for the content. Later you may add additional cards for specific materials that relate to a single objective and items of content. You will find that using cards makes you free to experiment with the order of ideas until they are in a logical sequence. Objectives can be added, eliminated, or relocated at this time.

c. Later during the actual storyboarding, and scripting, you may need to make further changes, but now you have a simple guideline to follow. At this stage you should include as much information as possible about the content, facts, examples, locations, reminders, etc. Visual ideas may come to mind while you are listing content. Note them on your cards. You should have an outline which includes an introduction, the body of the story with its main points, a conclusion containing a summary of the main points, and a closing.

(1) Introduction.

(a) Has an attention-getter.

(b) Gives a reason to watch.

(c) Gives objective and scope of the program.

(2) Body of the script. Organized into main points, with supporting material such as examples and illustrations.

(3) Conclusion of the script.

(a) Summary of the main points with examples and situations.

(b) A closing.

d. Notes should explain how to use student participation, internal summaries, or other variations to the basic outline.

e. Take time to carefully organize the outline. The body of the eventual program must be arranged logically so that students will easily be able to identify the main points that will lead them to the objective.

2. A suggested outline for a script should look something like that shown in Figure 1-2.

Figure 1-2. A typical outline

3. Let's discuss each of the major areas contained in an outline.

a. The introduction.

(1) The first part of your outline is the introduction. The introduction is in three parts, the first of which is the attention step. The attention step arouses the student's interest.

(2) The next part of your introduction is the motivation step. With this step you are providing the students with a reason for watching your program. To accomplish this step, you should relate the importance of your program directly to the students.

(3) The last part of your introduction is the statement of your objectives, or scope. By stating the objectives you are letting the student know exactly what information to be looking for in the program.

b. The body.

(1) The body of your outline should be organized into main points. Each of these main points should be supported by examples or illustrations.

(2) This supporting material should be designed with two things in mind:

(a) it should have credibility and,

(b) it should help the student discern the importance of the main points.

c. The conclusion.

(1) The conclusion of the outline consists of two parts, the summary and the closing. The summary consists of a recap of the main points and possibly mentions an example of each. The closing is an appropriate way of ending the program.

(2) There are, of course; many variations to this organization, especially should we decide to have some type of student participation in the program. We may want to have the program stop for student participation in a workbook, or to discuss what has just transpired. We may want to indicate certain points in our outline where the program will stop for student questions (just before the summary is a good place). We may wish to indicate places where we will have internal summaries. All these additions to the basic organization of our outline are most desirable, especially the inclusion of student participation. More on this will appear later.

4. The following is an example of an outline developed from the objectives found in Learning Event 2, paragraph 5.

OUTLINE

I. Introduction

Attention: Show a radio team using their equipment during a tactical situation.

Motivation: Show that the team cannot get through because of the broken antenna.

Objective: Be able to repair whip antennas.

II. Body

- a. Prepare antenna.
 - (1) Explain the requirements.
 - (2) Materials needed.
 - (a) Stick or branch.
 - (b) Tape.
 - (c) WD-1 Wire.
- b. Repair the antenna.
 - (1) Attach stick.
 - (2) Tape wire in place.
 - (3) Place in operation.

III. Conclusion.

- a. Summary.
 - (1) Attach stick.
 - (2) Attach wire.
 - (3) Tape in place.
- b. Closing. Show radio team communicating.

Learning Event 4:

IDENTIFY THE THREE APPROACHES USED TO DEVELOP A VISUAL INFORMATION TREATMENT

- 1. At this point in the development of your script you should have
 - (1) a specified audience,
 - (2) script objective,
 - (3) a content outline.

The next step in the preparation of your script will involve analyzing these three things and deciding on a treatment for your script. The method by which you approach the delivery of the information presented in your content outline is called the treatment.

a. You arrive at the treatment outline by examining the content outline and form an idea on how you might visually develop the generalizations. Form several such ideas and then put them into a written narrative form.

b. Writing the treatment is an important step that causes you to think through your presentation, putting it into a sequential, organized form that you and others can easily follow.

2. Treatments can be developed using these three different approaches: narration, personal involvement, and drama. The best way to show these approaches is to show you an example of each, using the outline from Learning Event 3, paragraph 4.

TREATMENTS

(Repairing Whip Antennas)

a. Narration Type.

The whip antenna is used to communicate with either an AM or FM radio. When an antenna breaks it can easily be repaired through "field expedient" methods. The procedures are relatively easy; simply use a stick, wire, and tape.

b. Personal Involvement Type.

Have you ever tried to communicate using a radio set that has a broken antenna? It's difficult. You can, however, get your message through by repairing your antenna using "field expedients." These field expedients consist of a stick, a piece of wire, and tape.

c. Dramatic Treatment.

During the Vietnam War, an entire infantry squad was wiped out because they were unable to call for reinforcements. It was discovered that the whip antenna on their radio set was broken. This situation could have been averted by using a stick, a piece of wire, and tape to repair that antenna.

Lesson 1
PRACTICE EXERCISE

1. What are the two main steps in subject research?
 - a. Observe copyright laws; be thorough
 - b. Collect and evaluate materials
 - c. Write an outline; get illustrations
 - d. Revise and create
2. What is the main worth of any instructional material?
 - a. It observes copyright laws
 - b. It impresses the student
 - c. It is effective
 - d. It comes from military manuals
3. What does SAT stand for?
 - a. Security Awareness Training
 - b. Select Appropriate Transitions
 - c. Systems Approach to Training
 - d. Scriptwriting Army Training
4. What is the main purpose behind writing a script for an educational program?
 - a. To impress students
 - b. To have students do something
 - c. To inform students
 - d. To have students understand a subject
5. What elements make up a content outline?
 - a. Storyboards and scripts
 - b. Objectives and audience demographics
 - c. Three- by five-inch cards and other graphics
 - d. Basic topics and factual information
6. How should you arrange the eventual program?
 - a. With strong visuals
 - b. With interesting music
 - c. With a logical arrangement
 - d. With explanatory notes
7. What are the three main elements you should stress in your script?
 - a. Specific audience, objectives, and content outline
 - b. General audience, learning events, and summaries
 - c. Introduction, attention getters, and general questions
 - d. Body, summary, and follow-up

8. What are three approaches you can use to develop a treatment?
- a. Music, special effects, and color
 - b. Discussions, questions, and feedback
 - c. Illustrations, graphics, and sound
 - d. Narration, personal involvement, and drama

LESSON 2
DESCRIBE THE PRINCIPLES OF SCRIPT WRITING

TASK

Define and identify the principles of visual information script writing (audio and video), and the various camera movements that support a presentation.

CONDITION

Given information and illustrations relating to the principles of visual information script writing and camera movements.

STANDARDS

Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test concerning definitions and the principles of visual information script writing and camera movements.

REFERENCES

None

Learning Event 1:

DEFINE AND IDENTIFY THE PRINCIPLES OF VISUAL INFORMATION SCRIPT WRITING

1. Before you start to write your script there are principles, or guidelines, that you should be familiar with. The next few paragraphs will discuss these principles. Before we get started, however, there is one factor that we need to stress, and that is creativity. No matter how much we dwell on these principles, your ability to be creative will mark the difference between a "good script" and a "bad script." Also, as the writer, personalize the script by using "you should", "you will", and "you know", as you write.

2. Script organization. Although the treatment helped you to organize the overall theme of the script, and the outline organized the material your script will cover, you still need to think about organization as you begin to write the script in draft form.

a. Should you systematically go through the whole outline making a picture for each heading and fact? Is it best to organize your script logically or to build from the simple to the complex, regardless of the outline order? There is no single best way by which the details of the content outline can be transformed into meaningful, related pictures and words. Two approaches have been established through experience, but they are by no means the only sound ones.

(1) First, carry an audience from the known to the unknown. Many successful materials start with those things with which the audience is familiar and then lead to new information and material.

(2) Second, build around the stages: introduction, development, and ending.

(3) You capture the audience's attention, (introduction), develop the content, and then summarize or review the activities. This is very similar to the overall content presentation (the outline).

b. Plan to have the student participate in some way, during or immediately after, the study of the material. Active participation definitely helps learning. Films, videotapes, and slides are designed primarily to present information, but many provide no opportunity for active participation. The way to create participation is to make involvement an inherent part of the material.

(1) Here are two suggestions for developing participation in visual information materials: include questions requiring an immediate response, and require a written explanation; or, have students make an oral summary. This type of activity, oral or written, can be accomplished through the use of a student workbook that is issued prior to viewing the program.

(2) More suggestions include requiring selection from among things shown or heard, and requiring performance related to the activity or skill shown or heard. This type of activity means that the program is presented in a "laboratory-type" classroom where the equipment is available.

c. These participating techniques often require a break in the presentation to allow the student to do some required activity. Some multimedia equipment can present the visuals on a timed basis. Also, be sure to plan for evaluation of the participation results and provide feedback to the subject indicating the correct replay or a comparison of measurement for his level of accomplishment.

3. Another thing to consider before you write your script is what is called a "thread of continuity." A thread of continuity is a connecting theme, story, or tone that runs through your entire script. Many times educational television scripts are adequate if considered segment by segment, but they are not cohesive in their entirety.

a. Some suggested threads of continuity include:

- (1) A story from the real world.
- (2) A series of examples connected by a narrator.
- (3) A "building block" approach.

(4) A chronological treatment.

b. The thread of continuity should keep your program cohesive with the basic organization we have already discussed.

4. Principles of video script writing. The message that the visual information media sends reaches the brain of the viewer two ways - through the eyes and through the ears. It is important that we understand the rules behind successful scriptwriting for the audio and the video portions of our final script. We will start with video; what the viewer sees.

5. The importance of "high visual" (rapid change in visuals). A picture on a television screen can hold the attention of a student for 20 seconds. By this we mean the same picture, unchanging, a "still visual," if you will. It is very important you have a high number of visuals in your script. At the very least you should have eight visual changes in any one minute. You should average at least one visual change every seven seconds. Obviously, it would be difficult to make this many changes in a slide program.

a. The question in your mind now should be: "What constitutes a change in visuals?" The following is a listing of the five things that constitute a change in visuals;

(1) The introduction of motion in still visual.

(2) "Freezing" a motion visual.

(3) A change in camera angle or movement.

(4) The introduction or elimination of color.

(5) The addition of some new object or person into the picture.

b. One of these five things happens about every three seconds in commercially-produced programs. A television commercial often has as many as 60 visuals per minute, and as many as 113 visuals have been seen in a 60-second commercial. This rapid change in visuals is called "high visuals." Excellent educational television is always characterized by a high number of visuals.

Learning Event 2: IDENTIFY CAMERA ANGLES

1. A change in camera angle or movement is a change in visuals. In a slide presentation the graphics work will create a change in visuals. All these changes can be visualized through the "eyes of the camera." Study the photographs in Figure 2-1, pages 17-22, showing the various types of camera angles and movements.

EXTREME CLOSE UP — ECU
(THIS REQUIRES SPECIFIC
INSTRUCTIONS —
ECU MOUTH)

CLOSE UP — CU

HEAD AND SHOULDER — HS

MEDIUM SHOT — MS

LONG SHOT — LS
OR FULL SHOT — FS

OVERHEAD SHOT — OS

**TWO SHOT (TO DENOTE
NUMBER OF PEOPLE)**

**OVER-SHOULDER SHOT
(OR REVERSE ANGLE SHOT)**

**CUT – THE VIEWER SEES AN INSTANTANEOUS
CHANGE IN THE SCENERY. THIS IS A
COMMONLY USED CHANGE IN VISUALS.**

Figure 2-1c. Camera angles and movements (continued)
(Two shot, over-shoulder or reverse angle shots and a cut change)

THE ZOOM

THE ZOOM EFFECT IS CREATED BY USING A ZOOM LENS. IT MAY ALSO BE CREATED BY MOVING THE CAMERA CLOSER TO, OR FURTHER FROM, THE OBJECT. THIS IS OFTEN CALLED A "DOLLY," ("DOLLY IN" OR A "DOLLY OUT.")

Figure 2-1d. Camera angles and movements (continued)

TRUCK RIGHT OR LEFT -- THE ENTIRE CAMERA MOVES TO THE RIGHT OR LEFT.

PAN RIGHT OR LEFT -- THE CAMERA REMAINS STATIONARY,
BUT TURNS TO THE RIGHT OR LEFT.

Figure 2-1e. Camera angles and movements (continued)

FADE – NOTICE THE PICTURE GOES TO BLACK, THE FADE IS
OFTEN USED TO SHOW LAPPED TIME.

DISSOLVE – NOTICE THE PICTURE NEVER GOES TO BLACK AS COMPARED TO FADE.

Figure 2-1f.
Camera angles and movements (continued)
(Fade and dissolve movements)

2. In addition to the camera positions and views shown, there are various effects that can be provided by television studios equipped with special effect generators. Some of those effects are shown below.

HORIZONTAL WIPE

VERTICAL WIPE

CORNER WIPE

HORIZONTAL PYRAMID WIPE

BOX WIPE

SAWTOOTH WIPE

Figure 2-2. Special effects (wipes) on the TV screen

3. When you write the final script, be sure to include a high number of visuals. Different combinations of camera angles and movements and different scenes can and should be used to your advantage. Remember, at the very least, eight visual changes in any one minute.

Learning Event 3:
DEFINE VISUAL CREATIVITY

1. It is generally recognized by the educational television industry that an instructional program placed in competition with commercial programs can hardly afford to be "plain Jane." The writer must make a diligent effort to "liven" up the classroom and make educational television more interesting and acceptable.

a. The point is that all educational television is deliberately placed in competition with commercial programs. This is because the students that view educational television also watch hours and hours of commercial programs. They are accustomed to high caliber production with conscious efforts to hold their attention made by the writers and producers of commercial programs.

b. Your program must exhibit the results of similar effort. There should be some element of entertainment in your program. It is very possible to mix entertainment and education as long as the former supports the latter instead of detracting from it. The techniques that are discussed below have been shown to be especially effective in maintaining student interest.

2. Visual metaphor is visually depicting something in an unexpected fashion in order to emphasize a point. It is a visual "play on words" (fig 2-3).

a. A viewer receives the message sent by the audiovisual media through two senses - sight and hearing.

Figure 2-3. Visual metaphor, using "eyes" and "ears"

c. It is highly unlikely that a student who has been exposed to the ideas that television's message enters through the "eyes" and "ears" expressed previously, could forget it. Yet, if we had just said, "it enters through the eyes and ears" with no creative video, the point would not have been made so well.

d. In using visual metaphor, we must be careful to consider relevancy and consistency. One irrelevant visual metaphor in the middle of a program is nothing but a distraction. Also, too many visual metaphors can become confusing. The visual metaphor is one of the most effective creative mechanisms for adding an interest-holding element to your program.

e. Point of view reversal. This is a creative mechanism used often in the commercial world. This camera angle looks at things just a little differently. How would an overhead projector see the transparency being

placed upon itself? How would a door knob see a hand about to grab it? (The video for each point of view reversal here could be easily accomplished in production by laying a transparency on the camera lens, and by having a person reach for a lens as they would a door knob.)

(1) A program needs to be "spiced up" production-wise by using this simple technique. In the context of a script, if someone is about to open a door, have his hand reach for the camera lens, then cut to a shot, from the other side of the door opening.

(2) This technique can be applied in numerous ways, and should be. Its use goes largely unnoticed, but it adds to the attractiveness of any program. The technique may be summed up as letting the viewer see things from different and unexpected points of view.

f. Write for the "eye" of the student: when we write video for a visual information program, we should write for the eye of the viewer. When possible, he should see things as he will see them on the job. For instance, if we are teaching someone to operate a radio, that task should appear on the screen as in Figure 2-4a, not like Figure 2-4b.

a

b

Figure 2-4. Correct and incorrect shots

g. Sometimes simple stick-figure drawings work as well as artists' renderings or beautiful photographs. Not everyone can afford the luxury of having great visual support. Simplicity in the video can be a virtue.

3. Let's summarize the principles of video script writing.

- a. High visual - at least eight visuals per minute;
- b. Use camera angles and movements for changing visuals.

c. Visual metaphor - using the video to emphasize a point by-depicting something in an unexpected way. (Remember that audiovisual enters through the eyes and ears?) It is a visual play on words.

d. Point of view reversal - seeing things from unexpected points of view, often used with inanimate objects. (Remember the doorknob?)

e. Write for the eye of the student - let him see it the way he'll see it on the job.

f. Simplicity - simple visuals work as well as complex visuals in many instances.

Learning Event 4:

DEFINE THE PRINCIPLES OF AUDIO SCRIPT WRITING

1. There are many similarities between audio and video script writing. In fact, some of the principles presented in the previous section can be applied directly to audio script writing. For example, if we take the video principle of writing for the eye of the student and apply it to audio, we come up with the first audio principle: write for the ear of the student.

2. Write for the ear of the student. Often the audio written for visual information programs sound stilted or unnatural. The dialogue given a narrator or character in a visual information program is usually dry.

a. Another reason for the problem is the fact that we automatically write differently than we speak.

b. A guide for accomplishing this is to ask the question, "How would a student say this?" Then write the audio for the students. We may even use slang when appropriate.

c. Another way to keep spoken audio conversational is to avoid lengthy sentences and big words. We don't normally speak in long sentences, and we don't normally use a lot of super words. Neither do the students. Here is an example of conversational audio:

"How ya doin"?

"Pretty good."

"Catchenny?"

"Cupla litluns."

"Whach a usin'?"

"Gobaworms."

"D'jeat yet?"

"No. D'ju?"

"Yup."

"Well, gotta go."

"See ya later."

"Yeah, g'luk."

d. This example may be a little exaggerated, but it was used in one effective educational program. The point is we want to make our spoken audio as conversational as possible.

e. Naturally, some subjects require a more sophisticated approach. Largely, the matter of conversational audio is common sense. Write for the ear of the student.

3. Voice-over and character. There are two types of spoken audio. "Voice-over" is audio that we hear spoken, but the person doing the speaking is not on camera, we can't see him on the screen. Character writing is audio for characters; the person doing the speaking is on camera.

a. Character writing. No two people talk exactly alike. When writing spoken audio for two or more characters, it is important to make a distinction between their speech habits. This distinction between character types is easy to take into account when writing, as long as you have a firm idea what your characters are like. If a character is a Texan, his part must be written as a Texan. Accents may be annotated by parenthetical note in the spoken audio.

b. Voice-over. The tendency when writing voice-over is to make the narrator sound like a narrator. In other words, often a narrator's spoken audio has been written in an unnatural "learned" style. While your narrator should be well informed, there is no reason why he should sound stilted. Write voice-over audio so that it sounds natural and is easy to read. You can check your success at accomplishing this by having several people read the narrator's spoken audio, and see if it sounds stilted. Voice-over audio must be indicated by parenthetical note, (V.O.), on the audio side of the script.

4. Sound effects. The use of sound effects can be very helpful in making scenes more realistic. Sound effects are written in parentheses: (sound of a dog barking). Special care should be taken however, to ensure that sound effects are relevant and useful, not costly distractions. Music, one kind of sound effect, must remain consistent with the visual action. Generally, music is most effectively used when introductory, or as transition or closing. The selection of music for visual information programs is regulated to some extent by copyright laws. Generally, any recording

labeled "BMI" (British Music Industry) can be used. Those with other labels like "ASCAP" (American Society of Composers and Publishers) cannot be used. Check with HQ, TRADOC, at Ford Monroe, Virginia, to clear any recordings you may want to use before incorporating them into your script. The exact format for both video and audio script writing will be addressed later. Below are things to remember about audio.

- a. Write for the ear of the student.
- b. Distinguish between voice-over and character writing.
- c. Use sound effects and music carefully.

Learning Event 5:

IDENTIFY AND DEFINE SCRIPT WRITING TECHNIQUES

1. Writing for a visual information script, that is, for a narrator or character, is different from writing for a book (a reader). There are certain rules that you must follow so the narrator will say exactly what is intended to be said. The following are a few of the rules that should be observed when writing a script:

a. The period. As in any writing, the period indicates the end of a sentence or thought. More periods are used in script writing because the sentences are generally shorter and more conversational.

b. The comma. Use the comma to indicate a pause shorter than a period. Don't use the comma unless you want the narrator to pause.

c. The dash. Use the dash to set off parenthetical expressions. For example: NATO - North Atlantic Treaty Organization - voted to ...".

d. The hyphen. Use the hyphen to help narrators in phrasing difficult words and to instruct them to pronounce individual elements distinctly.

Example: re-adjust, re-evaluate, PAN-AM

e. The dots. Occasionally, you can use a series of three dots to indicate a pause longer than that of a comma. The series of three dots can also be used for a dramatic effect:

Example: The jury foreman announced in a clear firm voice...
"innocent!"

f. The quotation marks. In addition to its normal use for indicating quotes, the quotation marks can also be used as an aid to narrators to set off nicknames, titles of books, and plays, etc.

Example: The Division - better known as the "Flying Blue Devils" - begin ...

g. The parentheses. Material in parentheses is normally not meant to be read aloud. Parenthetical material includes notes to narrators such as pronunciation guides, reading rates, etc.

NOTE:

In script writing, simple words say it best. Use words that everyone will understand, the narrator as well as the listener. Don't ignore colorful and descriptive words. Colorful and descriptive words add life to your copy. Keep in mind, however, the broadcast copy, especially hard news, must be clear, concise and correct.

h. Contractions. In day-to-day conversations, contractions are used rather liberally; therefore, you should consider using contractions whenever possible because it will add to the "conversationality" of your narrator. A definite exception to this rule is the "it will" contraction "it'll" which is awkward when you're trying to read it into a microphone.

i. Pronouns. There is a danger in using personal pronouns. When using he, she, or they, make certain there can be no doubt in the listener's mind as to whom you're referring. The ear can't go back and pick up the identification. Repeat the noun if there is any question.

j. Alliterations: Beware of alliterations. When you compose a sentence consisting of several words beginning with the same vowels or consonants, you have alliteration and the narrator has a problem.

Example: The westerly wind whistled wildly, or the lively little lasses laughed loudly.

k. Hissing sounds. Beware of too many sibilants ... "is" and "sh" sounds. They tend to create a hissing sound when read aloud.

Example: The six soldiers stood shoulder to shoulder as Secretary of State Shepard Shelton...

l. Homonyms. Watch out for homonyms, words which sound alike but have different meanings. The ear can't tell the difference between "won" and "one" or "bear" and "bare."

m. Here and there. Where is "here" and "there" when they're heard by listeners scattered over a wide area? Make "here" and "there" taboo words when you must refer to a location. "Here" in reference to a location could be any place it's heard.

n. Not "not". Avoid the use of the word "not" in your script. "Not" can easily be dropped out of your script inadvertently and leave the listener wondering if he heard "not" or not.

Examples:

USE

AVOID

Dishonest
Forgot
Unable

Not honest
Did not remember
Not able

o. Phonetic spelling. If there's any way for a narrator to mispronounce a name or an unusual word, he'll do it. So give him all the help you can. How? Write the phonetic spelling in parentheses and place it immediately after the troublesome word. Be sure to underline the phonetic syllable that is to be accented or stressed.

Example: Sergeant Kollman (coal-man) entered... Munich (mew-nick), Germany is the...

Make sure the phonetic spelling appears on the same line as the word it represents.

2. Abbreviations. When abbreviations are used, they are intended to be read as abbreviations. The use of well known abbreviations is permissible, such as ...Y-M-C-A, F-B-I, U-S, U-N, A-M, or E-S-T. You may also use Mr., Mrs., Ms, and Dr. "St" may be used instead of "SAINT", and in cases such as St. Louis or St. Paul.

NOTE:

Do not abbreviate military installation names. Use Fort (not Ft.) Gordon; it is the Naval Air Station (not NAS); it is United States, or U-S, Air Force, not USAF. Never abbreviate names of states, cities (except St. Louis, St. Paul), countries, political parties (except G-O-P), days of the week, months, titles of officials, and address identification such as street, avenue, drive or boulevard. Avoid starting a sentence with an abbreviation. A good rule to remember on the use of abbreviations is - when in doubt, write it out.

a. Examples:

WRITE

Captain Hawkeye
Airman Carlisle
Specialist Five Hill
Seaman Barker
Chief Petty Officer Otto
Radio Station W-I-N-L
World War Two
80 Miles Per Hour
Iowa

DON'T WRITE

CPT Hawkeye
AMN Carlisle
SP5 Hill
SN Barker
CPO Otto
Radio Station WINL
World War II or WW II
80 M.P.H. or 80/M-P-H
IA

b. Acronyms. When using an unfamiliar abbreviation or acronym which will be pronounced as a word, be sure to spell it out in the first usage.

Examples: "The US Army Signal Center and Fort Gordon, commonly called USASC&FG...or the Chief of Information, known as CHINFO..."

c. Numbers. Numbers present their own special problems to the scriptwriter for the sake of clarity. First of all, any number that begins a sentence is always written out.

(1) One to nine - Write out the numbers from one to nine: Exceptions -- sports scores, time (hours and minutes), dates, telephone numbers, and license numbers.

(2) From 10 to 999 - Use numerals for these figures.

(3) From thousand, million, billion - write out these figures. Example: 15 hundred, six thousand; 13 thousand, 500; and seven billion, 300 million.

(4) Conversational numbers - Make numbers conversational. Round out figures unless the exact figure is essential to your program.

(5) Dates - Write dates as October 1st...2nd, 3rd, 4th and 31st, and use four-digit numerals for years such as 1978 or 1892.

d. More examples of numbers:

<u>WRITE</u>	<u>DON'T WRITE</u>
(1) Money: 10 thousand dollars	\$10,000.00
(2) Fractions: two-thirds five-tenths one & seven-eighths	2/3's 0.5 1 7/8's
(3) Percentages: six percent onetenth of one percent	6% .1%
(4) Telephone Numbers: 6862377	six-eight-six-, etc.
(5) Addresses: 953 East 42d Street	953 E. 42 St
(6) Ages: 12-year old Mary Smith	Mary Smith, 12

<u>WRITE</u>	<u>DON'T WRITE</u>
(7) Time:	
10-30 this morning	10:30 am
10-30 am	1030 hours
6 pm	6:00 pm
(8) Decimals:	
22-point 25	22.25
six point five	6.5
(9) Roman Numerals:	
Louis the 16th	Louis XVI
Pope Paul the Sixth	Pope Paul VI
(10) Ratings:	
The number one team	#1 team
(11) Scores:	
9 to 4	nine to four
23 to 6	23 to six
(12) Odds:	
Three-to-one	3-1 or 3:1
(13) Licenses:	
H-L-S 1213	HLS-1213
(14) Height:	
Five feet-five inches	5 ft. 5 inches
	5X5
(15) Military units: (written as they're spoken)	
Seventh Fleet	7th Fleet
11th Corps	XI Corps
Eight 21st	821st
(16) Aircraft Designations:	
C-five "Galaxy"	C-5 Galaxy
C-one-30 "Hercules"	C-130

Lesson 2
PRACTICE EXERCISE

1. What is one main factor that should be stressed when writing any script?
 - a. Strong opening
 - b. Humor
 - c. Strong summary
 - d. Creativity
2. What must you think about as you write your script in draft form?
 - a. The ending
 - b. The overall organization
 - c. The style of presentation
 - d. The experience of the audience
3. What type of camera shot is a "tight shot of a mouth?"
 - a. Close-up
 - b. Medium close-up
 - c. Extreme close-up
 - d. Chin shot
4. What is another name for a full shot?
 - a. Extreme long shot
 - b. Long shot
 - c. Medium shot
 - d. Medium/close shot
5. What should you try to add to any type of visual presentation?
 - a. Entertainment
 - b. Factuality
 - c. Chronological development
 - d. High drama
6. What must be considered when using a visual metaphor (play on words/visual?)
 - a. The time of day
 - b. The age of audience
 - c. Relevancy and consistency
 - d. Color and sound effects

7. What is one major reason script writing is difficult?
 - a. Few people can type
 - b. We write differently than we speak
 - c. We are too lazy to research
 - d. Few people understand complicated sentence structure
8. What must you, the writer, give narrators?
 - a. Humorous anecdotes
 - b. Clearly defined major objectives
 - c. Lines that are conversational and natural
 - d. Lines that show how intelligent they are

LESSON 3
PREPARE A STORYBOARD AND A FINAL SCRIPT

TASK

Define and identify the procedures used for storyboard layout, the format, and how it leads to final script development.

CONDITIONS

Given information and illustrations relating to the procedures and format for a storyboard layout and for development of a final script.

STANDARDS

Demonstrate competency of the task skills and knowledge by responding correctly to at least 80 percent of the multiple-choice test concerning procedures and format for a storyboard and development of a final script.

REFERENCES

None

Learning Event 1:

IDENTIFY THE PROCEDURES TO LAY OUT A STORYBOARD

1. After all this preparation you are now ready to do some actual script-writing. But before we proceed, go back into your memory bank and recall the products you have developed that will guide you in writing this draft script. These are part of the "building block" process of scriptwriting; objectives, outline, and treatment.

2. With these documents and your knowledge of scriptwriting principles, you are ready to write a draft script on storyboard cards. See Figures 3-1 through 3-6 for illustrations of 11 different storyboard scenes.

Learning Event 2:

DESCRIBE THE PROCEDURES REQUIRED TO VISUALIZE A STORYBOARD

1. As you develop your story, try to visualize the situation you are describing. Remember, you are preparing a visual information program with the emphasis on the word visual. This will be difficult because you have been used to thinking in words; now you must learn to think in terms of pictures. Your picture thoughts should be specific visual representations of real situations or objects.

2. Let's put these principles into actual practice. The objectives, the dramatic treatment, and outline that were developed in the previous lesson are used as an example and put into storyboard format in the next few pages. (This storyboard is developed as a television presentation.) Study these cards to get a better idea of the storyboarding process. See Figures 3-7 through 3-20, for scenes 1 through 27:

STORYBOARD CARD

SCENE NO: 1

USASIGS

P R E S E N T S

INSTRUCTIONS:

FGSIGS FORM 46
1 MAR 77

NARRATION:

(Music begins - theme song from "Saturday Night Fever")

1.4.2.2

STORYBOARD CARD

SCENE NO: 2

REPAIRING THE
FM WHIP ANTENNA

INSTRUCTIONS:

Use Character Generator

FGSIGS FORM 46
1 MAR 77

NARRATION:

(music)

10514

Figure 3-7. Storyboards for scenes 1 and 2

STORYBOARD CARD

SCENE NO: 3

A radio team on a jeep operating their equipment under "combat" conditions.

NARRATION:

(Fade out music and bring in sounds of combat with a radio operator trying to contact higher headquarters.)

INSTRUCTIONS:

Use footage from TF 1-913 with dubbed in audio.

FGSIGS FORM 46
1 MAR 77

STORYBOARD CARD

SCENE NO: 4

Continue scene for 3 seconds then Zoom in for a MCU of the antenna.

NARRATION:

(Combat sound fades out but may still be heard in background.)

WHIP ANTENNAS ARE THE MOST COMMONLY USED ANTENNAS FOR TACTICAL RADIO COMMUNICATIONS

THEY ARE MADE OF SECTIONS OF METAL TUBING THAT CAN BE EASILY BROKEN OR LOST IN USE OR STORAGE.

INSTRUCTIONS:

Use a broken antenna

FGSIGS FORM 46
1 MAR 77

Figure 3-8. Storyboards for scenes 3 and 4

STORYBOARD CARD

SCENE NO: 5

INSTRUCTIONS:

slow zoom for a CU
of antenna

NARRATION:

DURING THE NEXT FEW
MINUTES WE WILL
SHOW YOU HOW TO
REPAIR THE VEHICULAR
MOUNTED ANTENNA
USED WITH THE FM
SERIES OF RADIOS.

PGSIG FORM 46
1 MAR 77

10514

STORYBOARD CARD

SCENE NO: 6

INSTRUCTIONS:

Use character generator
to label parts

NARRATION:

THE VEHICULAR MOUNTED
FM ANTENNA IS A
CENTER-FED DIPOLE.
THIS MEANS THAT THE
UPPER HALF OF THE
ANTENNA IS ELECTRICALLY
SEPARATED FROM THE
LOWER HALF, AND YOU
MUST HAVE BOTH
SECTIONS BEFORE YOU
CAN COMMUNICATE
EFFECTIVELY.

PGSIG FORM 46
1 MAR 77

10514

Figure 3-9. Storyboards for scenes 5 and 6

STORYBOARD CARD

SCENE NO: 7

INSTRUCTIONS:

A broken antenna will be supplied.

NARRATION:

WHEN THIS ANTENNA BREAKS, IT USUALLY BREAKS AT OR ABOVE THE CENTER CONNECTOR.

FGSIG FORM 46
1 MAR 77

STORYBOARD CARD

SCENE NO: 8

INSTRUCTIONS:

Show the parts on the hood of the jeep. This is where the repairs will take place.

NARRATION:

IF A REPLACEMENT IS UNAVAILABLE, YOU CAN REPAIR THIS ANTENNA USING FIELD EXPEDIENTS. ALL YOU NEED IS:

A STICK OR BRANCH THAT IS THE SAME SIZE OR A FEW INCHES LONGER THAN THE BROKEN PART, --

(MCU OF STICK)

FGSIG FORM 46
1 MAR 77

10514

Figure 3-10. Storyboards for scenes 7 and 8

STORYBOARD CARD

YOUR ABILITY TO
REPAIR AN ANTENNA
MAY SOMEDAY HELP
YOU OUT OF A
CRITICAL SITUATION

FGSIDS FORM 46
1 MAR 77

10514

Figure 3-20. Storyboard for scene 27

3. Let's try your hand at storyboarding! Using the following situation, develop the first five scenes in the cards below. (Don't make the "title scenes.")

Scene: The subject is automobile safety. You want to show that the number of people killed per year can fit in a football stadium.

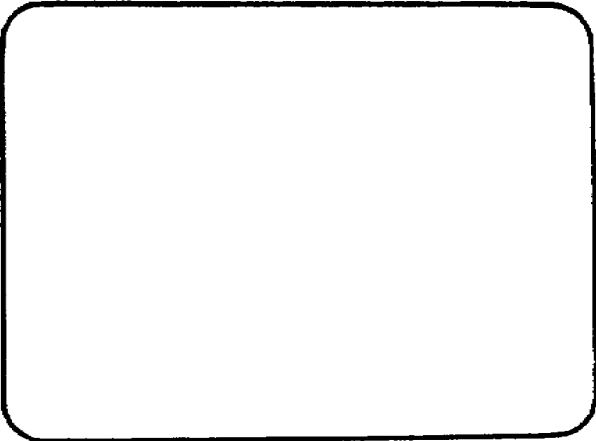

Scene: You may now want to show that some of these people might be killed on the way home from the game.

Scene: People can change when they get into a car. They become aggressive; they feel powerful.

Scene: Then there are those people that may have been drinking.

NOTE:

Start with a shot of a packed football stadium and follow an exciting play. Then go into your "ideas".

Learning Event 3:
IDENTIFY ELEMENTS OF THE FINAL SCRIPT

1. This is the final product in the "building block" process of writing a script. You are now ready to take the storyboard and put it into a script format. This script is the detailed blueprint that will provide all the necessary directions to those involved in producing a first-class visual information presentation. Some of the information contained in the script will include directions for: picture taking, artwork, filming, camera placement (or angle), audio, and special effects.
2. The script is laid out in a vertical two-column format and will look like the format shown on the next page (fig 3-22).
3. Figure 3-23 shows a completed script. Study this script; compare it to the storyboard and the other products to see the "building block" process. Remember - this script was specifically designed for television, but format and principles are still the same.

AUDIOVISUAL SCRIPT	TITLE :
VIDEO	AUDIO
<ol style="list-style-type: none"> 1. All video instructions will be on this side. 2. Video is single spaced and in upper and lower case. 3. Each scene from the storyboard should be on this side and numbered accordingly. 4. Same video as in 3 5. In addition to video description, show camera shots, angles and placement EX: "CU to HS shot", "Cut to LS of ..." 6. If this is a slide presentation, this column <u>may</u> indicate slide number also. 	<ol style="list-style-type: none"> 1. ALL AUDIO WILL BE ON THIS SIDE. 2. DOUBLE SPACE ALL AUDIO AND CAPITALIZE ALL SPOKEN AUDIO. 3. THE CORRESPONDING AUDIO FROM THE <u>SAME</u> SCENE <u>MUST</u> BE HERE. 4. (All parenthetical notes on this side are not spoken. They indicate sound effects, directional notes or music). 5. (Silent) 6. (Music Observe copyright laws when using music. TRADOC provides authorized music). 7. (Keep these things in mind about the audio): <ol style="list-style-type: none"> a. It explains the details of the video. b. It places emphasis on the center of attention. c. It must be closely related to the visual to reinforce it.

5. Summary. When writing a script for an educational visual information program, use the "building block" process and principles that we covered:

- a. Research the subject,
- b. Develop the outline,
- c. Write the treatment,
- d. Develop the storyboard, and
- e. Write the script.

6. We will never be able to overstress the fact that to be a good scriptwriter, you need more than the principles and exercises we covered in this subcourse. Your ability to be creative is essential; your "free-thinking" ideas and innovations are the elements that will enable you to become a good scriptwriter rather than "just" a scriptwriter. If you are in a position to use these principles, and practice them, then you are on your way to becoming a good scriptwriter. Remember, always write a script that uses the "personal" touch: "you should do", "we will;" and "Sergeant Jones received", etc. Good luck to YOU!

Lesson 3
PRACTICE EXERCISE

1. What elements make up the building block process of script writing?
 - a. Objectives, outline, treatment
 - b. Research, evaluation, summary
 - c. Alliteration, description, sound effect
 - d. Harmony, hardwork, and happiness
2. How is a storyboard card set up?
 - a. Audio on left, video on right, scene number centered upper left
 - b. Video on left, audio on right, scene number upper right
 - c. Audio on top half, video on bottom half, scene number lower left
 - d. Video on top half, audio on bottom half, scene centered on bottom
3. What is the necessary skill to develop as a writer when preparing a storyboard and a script?
 - a. Think in terms of descriptive words
 - b. Think in terms of pictures
 - c. Write for the ear
 - d. Write good, formal sentences
4. What is a final test of learning the principles of script writing for a visual presentation?
 - a. Pass a 50-question multiple-choice test
 - b. Write a 15-minute audio script with at least 5 cameras
 - c. Put the principles learned into actual practice
 - d. Write a funny, descriptive short story
5. What is the final product in the building block process of script writing?
 - a. The production
 - b. The critique
 - c. The script
 - d. The director
6. A script contains directions for picture taking, artwork, filming, and what other three elements?
 - a. Objectives, lessons, and summary
 - b. Names of actors, director, and writer
 - c. Time, place, and attitude
 - d. Camera angles, audio, and special effects

7. What are the two final steps after researching, outlining, and writing a treatment?
- a. Check with the producer, then the director
 - b. Do a storyboard, then write the script
 - c. Contact the public affairs officer and TRADOC
 - d. Select sound effects and music
8. In the final analysis, what is a key ingredient you need to be a good script writer?
- a. Know how to spell
 - b. Strive for perfection
 - c. Double- and triple-check everything you do
 - d. Be creative and a "free thinker"

FILMING UNCONTROLLED ACTION
(Developmental Date: 30 June 1987)

SUBCOURSE NO. SS0535-7

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

Three Credit Hours

GENERAL

This Filming Uncontrolled Action subcourse is designed to teach you the knowledge necessary to perform tasks relating to uncontrolled and semicontrolled action. Information in this subcourse is also available in the resident motion picture course taught in Advanced Individual Training (AIT) for MOS 84C. This subcourse is also intended to provide transition and merger training for soldiers holding MOS 84F, Audio, Television Production Specialist. This course is presented in two lessons, each lesson corresponding to a terminal objective listed below.

Lesson 1: PREPARATION

TASK: Prepare outline and equipment.

CONDITIONS: Given information and diagrams relating to preparing to film uncontrolled and semicontrolled action.

STANDARDS: Demonstrate competency of the task skill and knowledge by correctly responding to 85 percent of the multiple-choice test covering preparation.

(This task supports SM Task 113-578-2025, Prepare a Shooting Outline for Uncontrolled Action.)

Lesson 2: FILMING TECHNIQUES

TASK: Shooting uncontrolled action.

CONDITIONS: Given information and diagrams relating to uncontrolled and semicontrolled action.

STANDARDS: Demonstrate competency of the task skill and knowledge by correctly responding to 85 percent of the multiple-choice questions covering filming techniques.

(This objective supports SM Task 113-578-2044, Use Filming Techniques.)

*** IMPORTANT NOTICE ***

THE PASSING SCORE FOR ALL ACCP MATERIAL IS NOW 70%.
PLEASE DISREGARD ALL REFERENCES TO THE 75% REQUIREMENT.

INTRODUCTION TO FILMING UNCONTROLLED ACTION

These two lessons on filming uncontrolled action are designed to teach you the methods of filming uncontrolled action within your unit. The techniques are based on motion picture cameras. However, these lessons are equally adaptable to television camera usage. The television cameraperson can and should use these same techniques. Army Visual Information units are becoming more tactically oriented and will require efficient motion picture filming. Most of this motion picture filming will be performed in the field. Your ability to support the Army with usable motion picture or television documentation may well spell the difference between mission failure and mission accomplishment.

The term "visual information" has replaced "audiovisual" in the Army of Excellence.

LESSON 1 PREPARATION

TASK

Prepare outline and equipment

CONDITIONS

Given information and diagrams relating to preparing to film uncontrolled and semicontrolled action.

STANDARD

Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of the multiple-choice test covering preparation.

FM 11-82

Learning Event 1: DOCUMENTING ACTION

1. Uncontrolled action is usually associated with combat, news, sports, and field training. Uncontrolled action is any action that you cannot control in any way. The opposite is controlled action. Controlled action is usually a production-type situation. Semicontrolled action is a situation where you have some, but not total control over the action. Before you can shoot uncontrolled documentation action, you must be well grounded in the mechanics of television and film making. This includes: basic sequence, reestablishing, use of cut-ins and cut aways, screen direction, and continuity. When you understand how a good film is made, then you can make a good documentation film or a television tape.

2. One of the most difficult assignments a cinematographer has to handle is uncontrolled action. You must not only be technically correct, but must also think ahead for the next shot. This can be very difficult. One method of making the job easier is to use the shooting outline.

a. Unlike a script, the outline is a rough sketch of what the cameraman wishes to film. Except for spot news, most filming is planned. This planning may take days or it may take hours. Nevertheless, there is some planning that can be done before a mission is filmed.

b. Documentary filming is a vital component in the overall assignment of keeping the commander informed. The sight-and-sound report of daily happenings is measured by a narrow strip of celluloid or tape that mirrors the events which affect the lives of all who are part of this modern world of shrinking distances.

c. Every assignment is a challenge. The cameraman is a documentor armed with a delicate precision instrument. He must be thoroughly schooled in techniques of motion picture photography.

d. The ability to film motion picture or television footage of technical excellence is not the sole criterion of a documentation cameraman. True, they must have the previously mentioned qualifications, but coupled with this, they must be resourceful and capable of thinking clearly and quickly.

e. One of the biggest problems new cameramen have is filming under stress. That is, when the action will occur only once and there is no time to get a repeat shot, or when there is a time limit to get the film completed.

3. Elements of news documentation.

a. It is not simple to formulate a definition of news. A formal definition might be "until now, unpublished reports of those activities of mankind calculated to interest, inform, and/or entertain the public." Such a definition might satisfy Webster, but to really understand what makes news requires a knowledge of which activities interest people. Just what is it that interests the public?

b. Let's look into the mind of a news editor. When an editor evaluates material for newsworthiness, what do they look for? Some of the elements of news which the news editor considers are immediacy, proximity, consequence, prominence, oddity, conflict, sex, emotion, and progress. Let's consider these elements one at a time.

(1) Immediacy, or timeliness, relates to news being news. People are interested in current events. An editor may change the content of the news for an important event that occurred in the last hour, but tomorrow the same film may not even be considered because it is already "old stuff."

(2) Proximity relates to events that happen close to home. People want to know what goes on around them. If a soldier at Fort Carson receives a commendation for saving another soldier's life, it might appear on Colorado Springs' television at 6 PM, possibly on Denver television at 10 PM, but probably not at all on Los Angeles television.

(3) Consequence appears when newsworthy events affect human relationships or present a change in the status quo. News that affects many persons, even in a small way, is usually widely read.

(4) Prominence simply refers to the greatness or importance of the subject. Editors will run, as news, insignificant events if they happen to someone of consequence, such as the president.

(5) Oddity in an event is that which causes it to deviate from the normal. Unusual events or occurrences are inherently newsworthy.

(6) Conflict implies physical contact. Exploits of a football or baseball team are tales of conflict. Films contain conflict when they show man pitted against man, or man against the elements, or describe battles, riots, etc.

(7) Sex receives a large play in the news reporting. As military cameramen, direct your thinking to that which interests the sexes. Male readers are usually interested in sports, finances, and those things that affect their work. Women, while also interested in these things, are also usually interested in fashions and social events.

(8) Emotion is an all-inclusive term that sums up all the feelings, curiosity, sympathy, and anger possessed by human beings. It ranges from satisfaction of purely animal instincts to the highest spiritual strivings. It includes innate desire for food, clothing, and shelter; the ebb and flow of ambition, hate, love, envy, generosity, humor; and many other instincts.

(9) Progress is news that shows a change for the better. Anything concerned with maintaining peace, atomic energy, a cure for cancer, or technical developments, contains a newsworthy element that not many editors will pass up.

4. Treatment of documentation.

a. The most important thing to do when filming or taping documentation is to orient yourself to the event or happening. Then lay out a mental or written shooting script. Film your key shots first. Think in terms of a one or two-minute edited story.

b. Provide as much pictorial continuity as the situation allows. Locate the scene. Show where the event is happening. This would be the establishing shot. Try to create interest through a good choice of angles. Show people whenever possible and avoid static scenes. If possible, stage action when the situation permits. Complete the story by filming any immediate consequence of the event.

c. Try to think ahead so as to anticipate the action. Try to find out as much as possible about the event before you start filming. Ask questions of people in charge. This could be the police, fire fighters, or public officials. When possible try to speak to the highest official available on the scene. Many times the person closest to the action is not aware of the overall event. Locate the best camera angles before the event whenever possible.

d. If possible, duplicate important scenes. The second scene may result in a better expression or action. Try to vary the angle, distance, or where necessary, the focal length. When the action moves from one area to another or lighting conditions change, it is important to maintain proper exposure.

e. Shoot a lot of cut-ins and cutaways. Cut-ins very often can be obtained before or after the event. About 1/3 of your footage should be devoted to cut-ins and cutaways. These are absolutely necessary for the editor to put together a film that will fit into the time available. The final thing to do is to submit detailed caption information. This subject will be discussed in the next lesson.

5. Problems with sports.

a. Photography of sports and action demands the utmost from the photographer. Shooting this type of assignment requires considerable mental and physical agility, and a great deal of emphasis is placed on mastery of equipment and anticipation of the action. If you are not ready at the right place and at the right time, you may as well have remained at home. Sports photography requires a little different approach from that needed for an action sequence. The difference is in preparing for the assignment.

b. The first step in a sports assignment is preparation. You must research the sport. Usually, the sports assignment goes to the cameraman with an interest and knowledge of the activity, and you may meet these requirements. But regardless of your knowledge of the sport, it pays off to refresh your knowledge by researching the players. Players are specialists in their field. Some break fast and move with deceptive speed. Others excel under the basket, or with a bat. Know the players and their characteristic specialties. If a ballplayer known for his base stealing prowess is on first base, you should be ready for the action at second base. Also, a scene showing players arguing with officials can add color to your coverage.

c. Being familiar with the playing field can help you select the best camera angles, best distances to action centers, and so forth. For example, some ball fields have a short left field that invites home runs or action on the third base line. Research the coaches or team managers. Their individual characteristics and personalities can provide vivid color for your report. Coordinate your desires with these individuals. Clear your way to get some shots during timeout, or in the locker room.

d. A major point to remember when shooting sports is that you cannot ask the player to go back and redo the play for you. You get only one chance for the big one. To be a competent sports cameraman, you must be physically alert, agile, and aggressive. You must always remain mentally alert to anticipate the action and be decisive when it occurs.

6. Understanding how to shoot uncontrolled action, whether it is documentation, sports, a field training exercise or a combat documentation, requires the same techniques. If you can shoot under one type of uncontrolled conditions, you can film or tape under all conditions.

Learning Event 2:

WRITE OUTLINE

1. Before you can shoot an uncontrolled action you must have a plan. The first part of planning is gathering the data necessary to prepare a plan.

a. Preplanning.

(1) Anything a person does in this world is only as good as the planning that goes into the effort. A great deal of time and money can be wasted if a person tries to complete a task without first planning how he or she will accomplish it. The more planning that is done before starting a task, the quicker and more efficient will be the final outcome.

(2) Your preplanning must include such things as assembling equipment, notifying team members, ordering transportation, contacting the Public Affairs office if necessary, coordinating with other agencies that may be involved with the mission, researching the subject and writing a shooting out line.

(3) As part of your preplanning you will want to find out if there are any special or abnormal situations that may cause problems with filming or taping. Weather and climatic extremes could pose technical problems if you were not aware of them. You may be stationed at a post where the temperature is 70° and the sun is shining; but where you are going the temperature is 10° and it is snowing. You must make sure you and your equipment are prepared for any climatic extremes at the area you will be working in.

b. Research.

(1) Once you are aware of what the mission is to be, you can start your researching. First of all, are you familiar with the subject matter? If not, researching is the first thing you should do. You may want to go to the library and look up the subject and find out how it works, how it is done, or how to operate it. The more you know about the subject, the more insight you will have in filming the subject. It would be difficult for you to effectively film a golf match if you did not understand how the game is played. It is the same with any assignment. You can be a more effective cameraman if you understand the subject. Researching a subject before going on a mission has saved more cameramen from doing a poor job than you can imagine.

(2) There are many sources for material on any given subject. If it is a military subject, you may be able to obtain the information you need in your unit publication files, technical orders, or regulations. You may have a unit on your base or post that does essentially the same job. You could get the basic facts about the job there. Do not forget about your post library. You would be surprised as to the wealth of information and facts that are available at your library.

2. After all the necessary data has been assembled, you are ready to write a shooting outline. The outline is not a script as you would use in a production. It is a plan of what scenes you want to shoot in order to document a complete story.

a. The shooting outline is one of the first steps in preparing to film a story. Let us say you receive notice that a high ranking dignitary will arrive on the post and you will be required to document his visit.

(1) Your first step is to contact the public affairs office and the protocol officer. These contacts will advise you as to date and time of arrival, place of arrival, number of people in the party, and length of stay. As soon as possible, obtain a copy of the itinerary so that you can plan your filming locations.

(2) Next, you will want to go to the various locations and spot your shooting positions. Some of the things to check are: location of sun (try to keep sun behind you), if indoors, is power available for lights or will portable sun guns be necessary, what areas would be best for filming, and what angles would be best. Also, if power is available, you need to know how many extension cords are necessary.

b. Let us take a hypothetical assignment. Your unit received the following orders: "The Chief of Staff of the Army and his party are expected to arrive at your post tomorrow. Command requires complete picture coverage of all official activities of the Chief of Staff and his party while on our post." Your assignment is to get the motion picture or television coverage.

c. After you check with the protocol and public affairs office in charge of this event, you find that the Chief of Staff and party are expected to arrive by aircraft at 1300 hours tomorrow. The party will consist of the Chief of Staff and three aids. The purpose of their visit is to inspect the post and to award several decorations. The Chief of Staff and party plan to depart by aircraft at 1700 hours on the same day.

3. Writing.

a. With this information, you can now write your shooting outline and estimate the number of people and the equipment you will need to accomplish your mission. In an event of this kind, you cannot expect to stage or control many shots. It is similar to a grab bag--you reach in and take what you can, when you can. The following shooting outline is representative of what you might come up with:

(1) Scene 1. A series of shots from different angles of the Chief of Staff's helicopter as it lands at the heliport.

(2) Scene 2. Various shots of the Chief of Staff and party as they disembark from the helicopter and are greeted by the Post Commander. One stationary and one hand-held camera.

(3) Scene 3. Various angles as the party inspects honor guard. Two hand-held cameras.

(4) Scene 4. Multiple angles of the Chief of Staff presenting awards. One stationary and two hand-held cameras.

(5) Scene 5. Chief of Staff making a short speech. One stationary and two hand-held cameras.

NOTE: The term "hand-held camera" is used interchangeably with camcorder or ENG camera.

(6) Scene 6. Series of shots showing party touring the post. Two hand-held cameras working in a leapfrog pattern.

(a) Dining hall 1st Brigade.

(b) Post gymnasium.

(c) Post library.

(d) Maintenance Battalion.

(7) Scene 7. Multiple shots as the Chief of Staff returns to the parking ramp, boards aircraft, and it takes off. Two stationary and two handheld cameras.

(8) Your shooting outline should look like Figure 1-1.

SHOOTING OUTLINE				
SUBJECT: Chief of Staff Visit & Inspection		WO No. 87-110	DATE AND TIME 1000 11 Apr 87	
LOCATION: Ft Carson 4th Inf Div (Mech)				
SCENE No.	PROBABLE ACTION	LOCATION	TYPE OF SHOT/LENS	CAMERA LOCATION/ANGLE/LIGHTING
1.	Arrival at heliport	Front of Div Hq	LS,MS. Circling, landing	1 stationary, 2 hand held
2.	Disembark	Heliport	LS,MS,CU C/S & party exit	1 stationary, 1 hand held
3.	Honor guard	Front of Div Hq	LS,MS,CU of C/S & Div Cdr and honor guard members. Get lots of CI & CA shots	2 hand held Get salute as pass flags
4.	Awards presentation	Front of Div Hq	LS,MS,CU of presentations, get CU of soldiers faces	1 stationary, 2 hand held
5.	C/S speech	Front of Div Hq	MS,CU of C/S speaking. Get CA of crowd and other spectators	1 stationary, 2 hand held
6.	Tour of Post	Dining hall bldg 112 Post Gym bldg 255 Post library bldg 14 4th Maint Bn-bldg 670	LS,MS,CU of tour. Leapfrog to each new site.	2 hand held
7.	Return to Heliport	Heliport, front of Div Hq	LS,MS,CU party boards helicopter takes off	1 Stationary, 2 hand held
8.	Fly away	Helicopter exits Ft Carson	LS of helicopter leaving	1 stationary. Use back light and have helicopter exit frame

Figure 1-1. Shooting outline

(9) It could also be a very simple list of shots. This would include the scene number and probable action columns from the more formal shooting outline. Wherever possible, use the more formal style of outline. Whichever you use, the outline is an important part of your planning.

b. In analyzing your shooting outline scene by scene, you know that you need one tripod-mounted 16mm sound or television camera with two personnel, one to shoot and one to operate sound. Also, you need two hand-held cameras and one operator for each camera. As for film and tape requirements, each powered camera should have at least three loaded 400-foot (121.92m) magazines of film available or three 20-minute TV tapes. The two hand-held cameras should have no less than 600 feet (182.88m) of film or three 20-minute TV tapes available for each camera. This amount of film or tape for the four cameras allows for proper coverage of any normal camera, film, tape, or magazine malfunction. Now, let's see how the cameras might be used.

(1) In scene 1, the stationary camera (tripod-mounted) could be placed in a high position for an establishing shot showing the entire parking ramp with troops standing in formation, and the Chief of Staff's helicopter arrives at its designated parking spot. At the same time, the second stationary camera can be shooting a closeup of the helicopter as it is taxiing toward the parking position. During this period the two hand held cameras should be moving about picking up additional shots of the troops at attention, closeups of the Post Commander and various base personnel as they are awaiting the arrival, shots of the spectators, and a few shots of the band playing. In other words, capture all possible color for the opening scene.

(2) In scene 2, if possible, a stationary camera should be used for a medium shot showing the Chief of Staff and party descending the stairs leading from the aircraft and being greeted by the Post Commander. At this time, a hand held camera should be used for extreme closeups of both the Chief of Staff and the Post Commander as they are greeting each other.

(3) In scene 3, the two hand-held cameras should cover the Chief of Staff and Commander as they walk between ranks and inspect the honor guard. You should shoot from different angles, high and low, to provide as much variety as possible. This is a good chance to get a lot of cut-ins and cutaways.

(4) In scene 4, a stationary camera should be used for a medium long shot to establish the scene. The hand-held cameras should be used for closeups of the Chief of Staff as he pins the decorations on and shakes hands with the recipients.

(5) In scene 5, the stationary camera can be used for a medium shot showing the Chief of Staff in the foreground as he makes a short speech to the troops. This angle should include the Chief of Staff with the official party shown in the background. The hand-held cameras can be used during this time to film the reaction of the troops while the Chief of Staff is speaking.

(6) For scene 6, the two hand-held cameras should be used. Having studied the schedule, you have picked the highlights of this tour and will

shoot them. Always be ready for the unexpected. Many times things that you had not planned on will happen. So be prepared to shoot these unexpected happenings.

(7) Scene 7, showing the departure of the Chief of Staff, is practically a reversal of the first scene. The stationary camera can be used again for a medium shot showing the farewell, also the Chief of Staff and his party boarding the plane. The two hand-held cameras should be used for the closeups during this time. As the helicopter starts up, the stationary camera should follow it until it is out of sight.

c. At this time you might ask, "Why so many different camera angles for each scene?" Remember, you are following the action, scene by scene, as it happens, and there are bound to be breaks in continuity. The reason for different camera angles, whether they be long, medium, or closeup scenes, is to give the film editor ample footage to provide overlapping or matching action between scenes. This creates more audience interest, particularly when you move from a long or medium shot to a closeup. The long shot allows the audience to gather the full scope of the proceedings, and in the closeups, it sees exactly what is taking place at the point of interest. The fact that you will shoot cut-ins and cutaways goes without saying.

d. You can see that the shooting outline not only serves as a program for planning the sequence of coverage, but it also provides a basis for determining equipment, supplies, and personnel requirements, as well as, planning camera placement, movement, and shot framing. It also provides the time and date and where to report.

4. Prepare equipment.

a. After you have written the outline, you must get your equipment together.

b. After analyzing your outline you realize that you will need more than one camera and cameraman. This is when you must go to your NCOIC and present your outline. The NCOIC may modify it to use less equipment or personnel, but if you prepared a good outline, it should be justification for this effort.

c. In addition to equipment, you will need film, or tape, batteries, and a few extra items for backup.

d. Depending on which position you will be assigned on the mission, you must select your camera and equipment.

(1) Will you be shooting from a stationary position with a tripod-mounted camera or be mobile with a hand-held camera? If tripod-mounted, you will need large magazine or tape capacity, a tripod, and extra loaded magazines or tape.

(2) Do you have sufficient spare parts and extra expendables for the mission? Extra batteries are always first on a list of "spare parts." Extra film reels and cables, spare light bulbs for lamps, extension cords, and filter. Something as simple as a broken takeup reel could completely stop a filming session for quite a long time. It is usually the little things that cause a mission to abort. A good cameraman usually has all the little things necessary to keep the mission going.

e. The last thing you want to happen is that you run out of film, or tape, or your batteries die. Select your equipment, test it, and make sure your film is of the right ISO and matches the other cameramen.

f. Make sure you have the correct conversion filters, whether you are filming or taping.

LESSON 1
PRACTICE EXERCISE

1. What is the most important thing to do when filming documentation?
 - a. Prepare equipment
 - b. Orient yourself
 - c. Load camera
 - d. Write script
2. If possible, when filming what should you do for important scenes?
 - a. Duplicate them
 - b. Shoot around them
 - c. Add cut-ins and cutaways
 - d. Provide pictorial continuity
3. To be a competent sports cameraman, what must you be?
 - a. On time
 - b. In the right spot at the right time
 - c. Properly equipped
 - d. Alert, agile, and aggressive
4. If the President of the United States makes a statement, what element of the news does it fall into?
 - a. Proximity
 - b. Progress
 - c. Prominence
 - d. Oddity
5. When filming a subject, what extra equipment should you carry for backup?
 - a. Tripods
 - b. Batteries
 - c. Cameras
 - d. Empty cases
6. When must you research a subject?
 - a. When outline is complete
 - b. During preplanning
 - c. After shooting
 - d. While preparing captions

LESSON 2
FILMING TECHNIQUES

TASK

Shooting uncontrolled action.

CONDITIONS

Given information and diagrams relating to uncontrolled and semicontrolled action.

STANDARDS

Demonstrate competency of the task skill and knowledge by correctly responding to 85 percent of the multiple-choice questions covering filming techniques.

REFERENCES

FM 11-82

Learning Event 1:
USE BASIC SEQUENCE

1. The foundation of good camera technique is referred to as the "basic sequence." This applies to both film and TV cameras. Do not be disturbed at the mention of "camera technique" or "basic sequence," and anticipate many complicated rules to be followed. They are a set of simple points used by professionals to achieve good footage. If you want to tell a story, you must put together a wide variety of shots so as to obtain a smooth, meaningful, visual flow of action. The basic sequence is the most important of all the camera techniques that you will learn in your motion picture or television course. In short, you must understand your medium as well as your camera; you must know pictorial continuity. Pictorial continuity is the framework of every well-constructed motion picture, whether it is a Hollywood epic, newsreel, documentary, or service training film.

a. In 1907 most films were still produced as though they were plays. Each scene began with the entrance of the actors and lasted, unbroken, until their exit. The players were always shown full size and at a fixed distance from the camera. The motion picture still looked to most people like a shadowy carbon of the living theatre. No one knew how to break away from the older medium.

b. The man who did break away, and brought to life a new art, was David W. Griffith. He made his first radical innovation in 1909 when he departed from the old "one scene--one shot" method by demanding a change of camera position in the middle of the scene. In moving the camera closer to the actors, he had invented the "full shot" in which only the upper half of the

player's body was shown. The studio managers were shocked and believed people would think the camera work amateurish and that this scene had been included in the film by mistake. But the audiences, pleased at being able to read the actor's thoughts in their expressions, unmistakably endorsed the new method. Despite studio opposition, Griffith moved his camera nearer and nearer to the players.

c. As Griffith began to take closeups not only of his actors' faces but also of objects and other details of the scene, he demonstrated that it was the "shot" and not the actor which was the basic unit of expression of the motion picture. When, to the full shot and the closeup, he added the extreme long shot in 1909, he had completed the "long shot--medium shot--closeup" combination which remains today the classic approach to the material in every motion picture scene. After he also added a method of assembly and composition of these lengths of film taken of action at varying distances, the basis of modern technique had been established.

2. Continuity in cinematography.

a. The main goal of a cinematographer is to present the scenes he films in such a manner that they convey a complete idea to the viewer. To accomplish this requires considerable thought and planning. Individual scenes, each presenting an idea or part of an idea, must be arranged in logical sequence. Related scenes should flow one into another so that there will be no gap in continuity. Unrelated scenes must be joined into the film with smooth transitions so that they are accepted by the viewer as part of the story continuity. A well-filmed sequence, like a good story, starts with an interest-exciting introduction, progresses smoothly through its story, builds up to a climax, and reaches a reasonable conclusion.

b. As a motion picture or television cameraman, you will contribute the most vital element to a film production. You will supply the footage of the action and also film the footage needed for transitions that allow the editor to maintain continuity. You will usually work from a script when shooting controlled action, and you will furnish the scenes called for. But, since much of your time is likely to be spent shooting uncontrolled action, you must be well-founded in the basic shot techniques so that you can apply them to your shooting.

c. In this learning event we will discuss the basic shot breakdown and some of the techniques involved in applying it. We want to emphasize that these techniques are not absolutely rigid rules. You must know that the difference between a passable production and an outstanding work is the skill and imagination you use with these various techniques. Almost any cameraman can perform adequately by paying reasonable attention to applying the basic techniques. But the outstanding cameraman is the one who uses these techniques to create an interesting and imaginative production.

3. Basic sequence.

a. Every motion picture or television story is made up of one sequence or more. A sequence is a series of related scenes photographed with the long

shot, medium shot, and closeup technique. Each sequence is a complete story within itself.

In recording activity, the need for sequences becomes even more apparent. It is important that sequences be photographed with the idea that they will portray a completely understandable story when they are put together and projected on the screen. In other words, the story must be developed in the long shot, medium shot, and closeup, and not be left to the imagination of your audience.

(1) A good cinematographer will employ the three basic sequence shots of scenes, the long shot (LS), medium shot (MS), and closeup (CU). Let's take the long shot first. As the name implies, this is a shot taken at some distance from the subject. In the case of a man standing, it would most likely be a full-figure shot and would probably include some sky and foreground area. Second, the medium shot of the same person would probably cover from the top of his head to just below his waist line. Third, the closeup would most likely be of the person's head and shoulders.

(2) In many cases the three basic sequence shots are expanded to include the extreme long shot (ELS) and the extreme closeup (ECU). An extreme long shot of our standing person would show him as being quite small in relation to the rest of the picture. As an example, you can visualize an extreme long shot of a boat on the shore of a lake with a small figure of a man approaching it. The LS, MS, and CU show him getting in the boat, taking his seat and preparing to start the motor. Then an extreme closeup of his hands on the motor starter.

(3) When shooting the basic sequence, you should bear in mind that the size of the subject in relation to the full picture area is purely relative. The camera-to-subject distance will vary for any particular long shot, depending on the size of the original subject being photographed. For example, the distance required for a long shot of a humming bird would be an extreme closeup of a man's face. The main point to remember is that the size of the subject, in relation to the area it occupies on the screen, determines whether it is a long shot, medium shot, or closeup. You may find it hard to differentiate between these shots. Where does a long shot end before it becomes a medium shot? There is no hard-and-fast rule governing it. Your own good judgement and opinion is the only answer.

(4) At this point you are probably wondering where all these shots are used. Actually, it is a rather simple procedure and closely corresponds to the way the written story can be broken down to a basic structure of words, sentences, paragraphs, and chapters.

(5) A typical example of events in their logical sequence might be to place a camera in the position of a soldier when he walks into an orderly room to pick up his leave papers. His first impression is a broad general view of the room and the people in it; this is the long shot. Next, he walks closer to the first sergeant who is talking to the company clerk. The soldier approaches the group and the usual greetings are exchanged. That is your

medium shot. Finally, the soldier walks up close to the first sergeant to pick up his leave papers and directs his conversation exclusively to him. At this point you see only the first sergeant's head and shoulders. Now you have your closeup. If this series of events were to be filmed, the camera lens would take the place of the soldier's eyes and normally would record the same sequence of events.

(6) To impress this concept firmly in your mind, let us repeat the entire sequence once more, only this time see Figure 2-1 as a guide.

Figure 2-1. The three basic shots

Notice that this scene shows a soldier field-stripping a rifle. This is basically what the long shot shows--the man is leaning over the table with the rifle parts spread out. If you're interested in this action, you would move in for a closer look and, as you approach, at one point you would get an intermediate view of the action which is pictorially represented by the medium shot. Then, when you finally arrive at the scene of the action, you see it represented by the closeup. Each shot shows the action in more detail until, in the closeup, you can see every bit of the action. In Figure 2-1, this would be the soldier taking the weapon apart under the guidance of his squad leader.

(7) The shot breakdown, long shot, medium shot, and closeup, is a transition intended to take the viewer from a distant point to the place where the action is taking place and to do it in reasonable, believable steps. There are other means of accomplishing this and they will be mentioned later.

(8) At this point you may be wondering if changes to the LS, MS, and CU sequences can be made. Can you start with the CU? Yes, you can! After you have gained some experience, you might use such a technique. To illustrate, say you are shooting a training sequence for the military police. The first shot in the sequence might show a closeup of a gun lying on the floor. Then the camera might back up and a medium shot would show an overturned lamp and table. Immediately the viewer knows that some act of violence has occurred. Where has this taken place? Up to this point, until he sees the long shot, the viewer doesn't know. The LS establishes the fact that the action has taken place in, say, the library of an old home, and perhaps the police are just entering the room. Notice how the 1, 2, and 3 pattern (LS, MS, and CU) has changed to a 3, 2, 1 (CU, MS, LS) pattern. One word of caution: before you try this reversal technique, be sure you are familiar with the normal pattern. The reversal technique is generally used to obtain a special effect only; it should not be overdone.

(9) You may wonder if you can use a 3, 1, 2 order. The answer is that it generally produces an incoherent sequence and tends to confuse the audience. This is not to imply that it cannot be done. Almost anything can be done to the basic sequence, but any variation of technique is dependent on the story. Be sure that there is a logical reason when you deviate from the normal pattern. Remember, in most cases, the audience wants to see the action as if they were actually there.

(10) There is one approach to cinematography that you must consider at all times. Anytime you are taking motion pictures, you should feel that you are actually seeing for your audience. The simple fact is that if you don't shoot a scene, your audience won't see it. As soon as you stop shooting, your audience stops seeing; and if there are gaps in the continuity, your viewers can not fill them simply by looking around. The audience will see only what is on the screen. In the above mentioned mystery story, the culprit may have left by an open window, but the viewer won't know this unless you show the window on film. If the open window is important to the story, you must show it. Otherwise, a vital part of the story will be lost. Rather than risk forgetting the first important point in shooting successful motion

pictures or television, let's briefly review the important reasons for including all three of the basic shots.

b. The long shot. This normally is the first shot of the sequence, and it establishes the locality of the area the audience is viewing; hence this shot is sometimes called an establishing shot. It also gives the audience some background knowledge to prepare them for the scenes that follow. Without the long shot your audience may wonder where they are, and where the action is taking place. The locale must be set for every sequence, and the long shot is the technique used to accomplish this purpose.

c. The medium shot. While the long shot sets the scene, the medium shot introduces the action and the audience becomes aware of who, or what, the center of interest is. In addition, the medium shot allows for smooth transition from the long shot to the closeup. Remember in our earlier orderly room scene, the long shot showed the first sergeant and the company clerk. The MS then led the viewer's attention away from the room as a whole to a group of three people. The MS also provided smooth transition to a closeup of the main actors. A smooth transition from LS to CU is most necessary. Can you imagine the confused faces of the audience if you went from a LS of the whole room to a CU of the first sergeant's face?

d. The closeup.

(1) The closeup takes the viewer right to the action. Everything is eliminated from the scene except the particular thing you are bringing to the viewer's attention. The CU can create a feeling of intimacy and warmth. The next time you are talking to someone, notice how you are constantly looking at his face and picking out various details. Certainly you don't back off about 20 feet while talking with him. The same thing applies when shooting your film.

(2) The closeup is the most important shot of a sequence. It shows detail of the action thereby holding the audience's interest. You might consider it the climax of the sequence for just as a story has its introduction, build-up, and climax, each sequence has its LS, MS, and CU, with the CU being the most dramatic of them all.

(3) But there are other applications of the closeup. In training films, the closeup shows the viewer what he is supposed to learn. Through the closeup, the actual performance of a task can be demonstrated in such a way that the viewer has little difficulty understanding it, and complex operations can be made comparatively simple. Situations of this sort usually call for a series of closeups, perhaps three or four. After that, it is necessary to reestablish the scene to remind the viewer of the action as a whole.

4. There is, in the art of cinematography, what is known as the Absolute Rule. This rule states, "Whenever the camera is stopped, change the angle and/or image size before you resume filming." Sometimes it is preferable to change both. This rule must be followed at all times when shooting action of any type. About the only time it is not used is when you are filming animation or inanimate objects.

a. With the filming of sequences comes the problem of visual retention versus closeups. The average person viewing a film or tape on the screen ordinarily will retain only one or two scenes immediately preceding the scene being projected. With so much of the surroundings being eliminated in closeups, the audience occasionally must be reoriented in relation to those surroundings. Closeups without reorientation will tend to confuse, and may even completely "lose" the spectator; especially where several closeups appear consecutively. This reorientation is accomplished by making what is generally termed the reestablishing shot. This will be explained in the next learning event.

b. When we speak of the extended sequence we mean the basic sequence, that is, long, medium, and closeup with the addition of extreme long shots and extreme closeups.

c. Finally, the entire sequence can be reversed. Start with a closeup and move back to the long shot.

Learning Event 2:

SHOOT REESTABLISHING SHOTS

1. Reestablishing.

a. An audience usually has difficulty remembering more than one scene back. The experienced cameraman reorients his audience from time to time by furnishing scenes for this purpose. These scenes are called reestablishing shots.

(1) A series of related shots make a sequence and sequences joined together make a story. Sequences should be joined together with a reestablishing shot. This makes the story clear, unbroken, and results in a smooth flow of action.

(2) The reestablishing shot (RS) usually is a medium or long shot. It usually follows a closeup and is used to reestablish the general scene. In other words, it reminds the audience where they are.

(3) The RS is used to tie sequences together and to keep the audience from getting confused or lost. The audience can rarely keep in mind more than one scene at a time and the RS will help keep them oriented. Also it is a good idea to remind audiences how a small scene fits into the larger scene that includes it.

b. Reestablish the scene when the subject is moved from an old to a new location. Use the RS to end a sequence.

(1) In the reestablishing shot, the camera is moved back from the closeup position and a scene is made in which the spectators once again will see where the closeups were taking place in relation to the surroundings. Usually a medium or medium-close shot will serve very well for reestablishing, after which it is perfectly permissible to move in again for more closeups.

Not only does the reestablishment shot keep the audience oriented at all time, but it lends variety in camera positions which is always a desirable factor.

(2) Instead of ending a sequence with a closeup, use a reestablishing shot. This leaves the spectator with the satisfied feeling that he has seen all the important details as the sequence ends, and is not left "hanging in midair" on a closeup while expecting a continuation of the action.

(3) Reestablishing is also used to tie two sequences together. One way of accomplishing this is to reestablish at the end of one sequence and have the person walk out of the scene. Now, by showing the person entering in the establishing scene of the second sequence, a definite relationship has been achieved between the two separate actions even though there may be some distance between the locations of the two sequences; the audience accepting the fact that the story has continued uninterrupted up to this point. This technique is called "moving out and in the frame."

(4) Two sequences also can be tied together by making the reestablishing shot and then panning with the person as he moves from the location of the first sequence, using the pan shot as the opening scene of the second sequence, and continuing the second sequence with medium and closeup shots.

(5) Where two sequences take place near each other, a reestablishing shot can be made in which both locations can be seen. When sequence number 1 is finished, move the camera back to include the location of both number 1 and 2, thus establishing the second location in relation to the first location. The camera can then be moved in for the story taking place at location number 2. This conveys to the spectator the exact distance between the two locations.

c. Methods of reestablishing.

(1) There are three methods of reestablishing a scene. The first is by pulling back; we pull or move the camera back away from the subject. In other words, we go from a closeup to a medium or long shot. We could possibly go from a medium to a long shot. The second method is pulling back and panning. This method is used to follow a subject from one location to another. This is normally used for covering short distances only. The third method is shooting a reverse angle. This is done turning the camera around 180° from the preceding shot. It is usually used to show a subject changing location over a great distance.

(2) Transitional devices are sometimes used to reestablish action. These devices are: gesture or implication; in and out of frame; clean exit and entry, and optical effects.

(3) The gesture or implication is used to show that something is about to happen and the audience knows by the gesture or implication what is to happen next.

(4) Several in and out of frame scenes with clean exits and entries will carry the subject to a very long distance.

(5) Clean exit and entrance used once will carry a subject to a nearby location.

(6) Optical effects are mechanical methods done in the laboratory to reestablish action and make transitions between sequences. The most common opticals are fade-in and fade-out; wipes; dissolves; and swish pans. The swish pan is a panning shot in which the camera moves so fast that the action is blurred and unrecognizable. These effects can be made with a television editing system when shooting TV tape.

d. These techniques are all part of filming a production. That is, you control all the action. Understanding what makes a good documentary will also help you provide good footage when shooting uncontrolled or semicontrolled action. You must first understand what makes a good film. Once you have mastered the techniques, then you will find it rather simple to make good documentation films or tapes.

2. Camera angles.

a. Although the subject of camera angles is different from that of the basic sequence breakdown, the two are very closely tied together. Refer to Figure 2-1 and examine the soldier field-stripping a rifle. If these three scenes had been shot a little differently, the quality of the sequence could have been greatly improved. A simple way to build interest at this point is to change the camera angle between each of the scenes. When you bring the camera closer for each scene, change its angle at the same time, as shown in Figure 2-2.

b. It should be apparent that there is a definite improvement in the sequence when you change not only the camera angle but also the subject distance. If you merely change distance, the only variation between the scenes of the sequence is the change of subject size. Moreover, slight differences in action will be more noticeable on the screen and a change of camera angle will minimize this. Another advantage of changing the camera angle is that it provides variety in your scenes and makes the overall production much more interesting.

c. When changing camera angles, be careful that you do not suddenly reverse or change the camera position to an excessive degree between any two scenes. If the reversal or change is too abrupt, the scene may look as if an entirely different subject is used. By the time viewers realize what has happened, they may have lost the plot. A good rule to follow is never change angle more than 45° between shots.

(1) While you are changing the angle between scenes during the basic sequence breakdown, another variation possibility exists--you can also vary the height of the camera. For example, both the LS and MS are shot at eye level and, then when you are coming in for the CU, you lower the camera to almost ground level. Any type of variation would be suitable here, depending

Figure 2-2. Angle and distance variation

on the circumstances of the sequence and the mood you are trying to convey. You will find that a low camera angle tends to make the subject higher and seem more important, while a high viewpoint tends to reduce both the size and apparent importance of the subject. Here again a too-abrupt change of angle can cause audience confusion. Unless you are after a special effect, 45° should be the maximum.

(2) Very often mechanical features of the terrain force you to make a change in camera angle. Using Figure 2-1 as an example, it is possible that an object such as a cabinet might be in the way, causing you to shoot from the rear of the table instead of the side. Each separate scene will vary as to shooting possibilities, and it is impossible to make definite rules; or if they were made, they would be impossible to follow. Here again, your judgement, and eventually your experience, plays a large part. By combining the three different techniques--varying subject distance, changing camera angle, and changing camera height--you reach the ultimate in getting the most interest and variation from the basic sequence. This is not to say that you must use all the variations at all times. It may be that a change in camera angle will not help the scene, or it may be impossible to vary the camera height. So once again your judgement and experience, coupled with the story and combined with the many other consideration, will determine your approach.

(3) By regulating the angle at which the action passes across the axis of the lens, angle shots can serve to speedup or slowdown action. Objects moving at right angles to axis of the lens appear to be the fastest, while objects approaching the lens directly, or going straight away from it, are the slowest. Any degree of apparent speed can be obtained by selecting some angle between these two extremes.

d. The mood of a scene and its psychological effect on an audience can be molded by a proper choice of angle. For example, in some of the horror movies you have seen, the villain is usually shot from a low angle to make him seem huge and menacing, while the heroine would be seen from a high angle to emphasize her helplessness. The scene now gives you the feeling that the villain is all-powerful and cannot be overcome. But when our hero comes to the rescue, he is given the low angle treatment making him the strong personality.

e. The one important thing you should remember when using angle shots is to be careful that your angles are not obvious. Your audience should be aware only of the action and the mental impression being conveyed. If they admire the terrific angles in your sequence, the main objective--telling the story--is lost.

3. Sequence development.

a. The basic-sequence technique is the fundamental step in producing good storytelling documentation. Remember that your job is to tell a story. The basic sequence breakdown, camera angles, and overlapping action all play an important part in maintaining continuity of the story. In a motion picture, continuity is the continuous and coherent flow of the action and story. In the various camera angles that carry a sequence of scenes from a long shot to a closeup, each shot must match the other so closely that anyone viewing the picture on the screen will feel as though he had actually stepped closer to the person or object shown. If you shoot the proper amount of overlapping action, the transition from one scene to the next is unnoticeable, thus contributing to a smooth flow. All of these things play a large part in the production of a good documentary. However, this isn't the entire offering of a good story. Many other factors must still be considered.

b. Maintaining audience interest is the main consideration of a good motion picture or television story. The picture is a failure and is not doing the job it was designed to do if the interest of the audience is lacking. In the case of an instructional or research film, the result is more than just a loss in entertainment value. A new rifle can look good, it can be sturdily constructed, and it can have the latest features; but, if it won't shoot, it's like a movie that can't keep the audience interested -- it just isn't doing the job it was designed to do.

Learning Event 3:
USE CUT-INS AND CUTAWAYS

1. Accepting the premise that the motion picture or television audience has difficulty in recalling more than one scene immediately preceding that which is currently being screened (a fact which the reader may personally check) the cameraman may insert a special scene (or even entire sequences), between two scenes which otherwise, following in rapid succession, would interrupt story continuity. These scenes of slight, yet important, differences intended to divert audience attention are classified as either "cut-ins" or "cutaways."

2. Cut-ins.

a. A technique for maintaining continuity and bridging gaps in action is that of shooting a cut-in. As the name implies, the cut-in cuts into the action taking place and is usually a closeup or extreme closeup.

b. In a sequence showing two people meeting, a closeup of their handshake is a cut-in. If your subject is packing for a vacation, and you wish to show how well-traveled he is, an extreme closeup of hotel labels on his bag constitutes a cut-in.

(1) To illustrate, suppose you are filming a golf tournament. The highlights of the action in a golf game are the drives, the various approach shots, and, of course, the putts. Then, there is a great deal of walking in between these bits of action. The walking is part of the game, but it would be ridiculous to try to show it all. In the first place, you would be bored. Here's where the cut-in technique can make an interesting sequence out of one that would otherwise be unbearable. Your cut-in could be the shot shown in Figure 2-3.

(2) The next scene of the series most likely would be another long shot showing a continuation of the action. The golfer might approach the ball, stop, and sight the cup before making his putt. Another variation of the same technique could be a cut-in filmed in slow motion of the club hitting the ball. Or, you could use a closeup of the golfer's grip on the handle of the club. Any number of variations of the cut-in are possible.

(3) Use your imagination, but do not overdo a good effect. Remember one point, however, a cut-in does just that, it cuts into the action and must be established in the previous scene.

Figure 2-3. The cut-in

3. Cutaways.

a. An opposite, but also effective, technique from the cut-in is the cutaway. In a cutaway, the camera is directed away from the main action to show some parallel action that is taking place at the same time. For example, while filming a troop review, a shot of the audience is a cutaway. It is related to the main action, although not part of it, it is a part of the story and must be shown. The cutaway smoothes out the continuity by bridging gaps and is used to cover up major jumps in action.

b. The cutaway is also used to build atmosphere and stimulate the interest or the imagination of the audience. For instance, while filming a missile launching, cutaways of the block house and the strained faces of the engineers might transmit the feeling of excitement to the audience. Or, suppose you are covering boxing matches. Most of the action is exciting but there are lull periods. These can be filled with cutaways of the time keeper, of the referee, and the spectators. The drama and suspense of the fight might be heightened by extreme closeups of the moving second hand on the timekeeper's stopwatch, and by a shot of the clapper striking the bell at the start or end of a round.

c. During a long story, the cutaway also helps to reorient the audience in essential parts of the plot that are not being shown at the moment. A cutaway of action taking place at widely separated locations can be included if it is part of the story. Thus, the audience is able to follow the plot and even though the story shifts from one area to another, the transition is smooth and acceptable. A simple illustration of the effective use of the cutaway is shown in Figure 2-4. Variety and interest in a golf game are increased by a cutaway to the caddy showing him removing the flag from the cup.

Figure 2-4. The cutaway

4. Requirements and limitations.

a. In order for scenes to be considered suitable for use as cut-ins or cutaways, they must meet certain requirements. These limitations are threefold:

(1) They must change audience attention from what otherwise would be a loss of continuity in order to prevent audience distraction. Losses of continuity can be prevented by footage which includes jumps in action, changes of screen direction or allowance for time passage.

(2) They must be part of the immediate action (a cut-in) or pertain to the story (a cutaway). Footage which does not contribute to the story is not suitable for use. Rather than aid in keeping the audience oriented as to what is occurring, such footage would only serve to confuse the viewers and contribute to the loss of continuity.

(3) If the cut-in or cutaway is to be useful in maintaining audience orientation, it must be clearly established in the audience's mind. The two methods by which this may be accomplished are by either visual awareness on the part of the audience or by suggestion resulting from reasoning or expectation of the audience. For example, a long shot of the street where the tenement fire was taking place, would show the spectators which would normally be expected at the site of a catastrophe. Later, scenes of one or more of these bystanders could be used as cutaways. The audience had previously been made aware of these people by actually seeing them. Should the cameraman have failed to film these onlookers, he could still use shots of these people as cutaways. The audience would assume that these shots were of people watching the fire.

b. Because a cut-in must have been clearly brought to the attention of the audience, as well as having appeared in the immediately preceding scene, the cameraman cannot be satisfied with merely having the cut-in material included in the first scene. The camera angle, image size, and action must be such that where the cut-in is screened, the audience will immediately recognize and understand it. Being part of the immediate action and having been included in the preceding scene, the cut-in is usually a medium shot or closeup.

c. Cutaways, not part of the immediate action, but pertaining to the story, do not necessarily appear in the preceding scene, but must have been established, either visually or by suggestion at any earlier point in the story. Therefore, a cutaway may be anything from an extreme long shot to an extreme closeup.

Learning Event 4:
MAINTAIN SCREEN DIRECTION

1. Screen direction.

a. In motion pictures, your subject spends considerable time moving about. When the subject is seen on the screen going from one place to another, the direction it takes is known as screen direction. It seems obvious that once your subject establishes the direction he is going to take, the audience should see him move in that direction until there is some logical reason for him going in another direction. The audience should then be made aware that the subject is changing direction.

b. To illustrate, suppose you are covering an Armed Forces Day parade and your camera is set up as shown in Figure 2-5. The troops are moving from left to right in front of your camera and will move from left to right across the screen. If you cross the street and pick up the same subjects (fig 2-6), you reverse their screen direction. Even though the parade is still going in the same direction down the street, it is crossing in front of the camera from right to left, and will take that same screen direction. To the viewer, it will look as though the parade is returning to its starting point. He may be completely confused. Thus, you owe it to your viewer to keep him oriented.

c. It is not difficult to maintain screen direction when you are shooting controlled action or uncontrolled action that behaves in a predictable manner. A simple method for establishing and maintaining screen direction is by using an imaginary line drawn through the direction of travel. In the case of the parade (fig 2-7) from the rear through the front of the car, or left to right. If all your shooting is done from the same side of the imaginary line there is no problem. All of your shots will have left to right screen direction. When you are shooting from a script (controlled action), screen direction is easily controlled. However, when you are filming an uncontrolled subject, it helps to note the subject's direction at the end of each scene and refer to it before shooting the next scene.

Figure 2-5. Screen direction

Figure 2-6. Screen direction reversed

Figure 2-7. The imaginary line

d. Sometimes it is necessary to take up a camera position on the opposite side of the action. And sometimes it is necessary to have your subject change direction. In either case, you must let your audience know that the change is taking place. Some of the ways that you can show or mask changes in screen direction are:

(1) Have your subject actually change direction and show the change on the screen. If you film a sequence showing a sentry walking his post, show him moving in one direction; then pick him up as he is doing an about face and show him moving in the opposite direction.

(2) Gradually film around your subject and include a neutral shot. In the parade scene mentioned previously, if you film from the other side of the street you could have worked around the vehicle. This of course will change screen direction. Before crossing the street you would have to move out in front for a "head-on" shot, or behind for a "tail away" shot, either shot is neutral in direction. Now you can pick up the action from the opposite side of the street. The screen direction is reversed, but the audience knows how it came about. Remember not to change your angle too abruptly or it will cause a shock to the audience. Gradually working around the subject is the key to this technique.

(3) Introduce a scene (cutaway) to divert your audience. The attention of the audience can be diverted from the screen direction of the subject by the use of a cutaway. Again using our parade scene as an example, to conceal the change in screen direction, a cutaway shot of a person watching the parade will serve to divert the audience awareness in the change of screen direction. It is always better to use two or more cutaway scenes in this situation thereby utilizing the audience's inability to remember more than two scenes back.

(4) Use of a prominent object to orient the audience to the movement of your subject. Use a reference point that the audience can recognize. If, for example, our subjects in the parade should be passing toward a prominent statue. One cameraman filmed the scene from one side and another camera filmed the action from the other side. These two scenes edited together would have contrasting screen direction. By seeing the statue in both scenes the audience will accept the fact that the subject is still going in the same direction.

(5) Contrasting screen direction. Abrupt changes in screen direction are sometimes used to create special effects. For example, scene 1 is a sports car speeding from left to right across the screen. Scene 2 is a fast passenger train crossing the screen from right to left. Scene 3 cuts back to the car, and scene 4 shows the train again. The audience begins to realize the car and the train are coming together and a crash is imminent. But, the car's direction must always be from left to right, and the direction of the train must always be from right to left. The whole effect will be lost should the car or train change direction.

(6) Dynamic screen direction is shown as moving bodies either from left to right or right to left and neutral is moving away from or towards the camera. A static direction is that of a body at rest. Remember that even the static body-must show screen direction. Remember also the imaginary line. Crossing improperly will change screen direction and cause confusion. Contrasting screen direction creates suspense and in travel sequences remember your map consciousness. Finally, clean entrances and exits are important when introducing or eliminating different elements, whenever a series of moving shots are filmed against different backgrounds, or when a subject moves from one room to another.

2. You can now establish a few rules to help you maintain screen direction.

a. Remember the direction your subject is moving at the end of a scene. Maintain that direction in the following scene. Use the imaginary line.

b. Show the subject making changes in direction, whenever possible.

c. Visually explain the change to your audience so that they can maintain continuity.

LESSON 2
PRACTICE EXERCISE

1. What is included in an extended sequence that is NOT in the basic sequence?
 - a. Long shot
 - b. Closeup
 - c. Reestablishing shot
 - d. Extreme closeup
2. What is the foundation of good camera technique?
 - a. Shoot everything
 - b. Basic sequence
 - c. Different angles
 - d. Various shooting speeds
3. What is the main goal of a cinematographer?
 - a. Cover scenes
 - b. Expose total film
 - c. Shoot basic sequences
 - d. Convey a complete idea
4. What shot is used to reorient the audience?
 - a. Change in angle
 - b. Extreme closeups
 - c. Cut-ins or cutaway
 - d. Reestablishing shots
5. You want to show a person as powerful and tall. What technique can you use?
 - a. Closeups
 - b. Medium shots
 - c. Shoot from the left
 - d. Shoot from a low angle
6. In the final analysis of a motion picture, what is the main consideration?
 - a. Good exposure
 - b. Complete basic sequence
 - c. Maintaining audience interest
 - d. Total use of cut-ins and cutaways

7. You want to divert the audiences attention. What technique can you use?
 - a. Distractive scenes
 - b. Cut-ins or cutaways
 - c. Extreme long shots
 - d. Extreme closeups
8. What is one purpose of the cutaway?
 - a. Show specific action
 - b. Cover major jumps in action
 - c. Complete a basic sequence
 - d. Maintain screen direction
9. How can you show or mask changes in screen direction?
 - a. Film around your subject
 - b. Shoot an extreme long shot
 - c. Shoot an extreme closeup
 - d. Shoot a reverse angle
10. You want to show an imminent disaster. What filming technique can you use?
 - a. Rapid basic sequence
 - b. A series of cut-ins
 - c. Long shots and closeups
 - d. Contrasting screen direction
11. When should you use contrasting screen direction?
 - a. To show distraction
 - b. To cover jumps in action
 - c. To create suspense
 - d. Confuse the audience

ANSWERS TO PRACTICE EXERCISES

DOCUMENTATION CINEMATOGRAPHY

SUBCOURSE NO. SS 0536-B
(Developmental Date: 19 October 1990)

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

Four Credit Hours

GENERAL

This Documentation Cinematography subcourse is designed to teach you the knowledge necessary to perform tasks relating to documentation of subjects in both tactical and nontactical situations. It provides information on various filming techniques, team coverage, captions, and slating. This course is presented in three lessons, each lesson corresponding to a terminal objective listed below. The techniques are also applicable to television cameramen.

Lesson 1: FILMING TECHNIQUES

TASK: Describe the various techniques of filming subjects for Army documentation purposes.

CONDITIONS: Given information and diagrams describing various techniques of filming subjects for Army documentation purposes.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering filming techniques.

(This objective supports SM Tasks 113-577-5010, Perform Aerial Motion Media Photography; and 113-577-4040, Perform Motion Picture Filming Techniques for Television.)

Lesson 2: PERFORM TEAM COVERAGE

TASK: Describe the various methods of conducting team coverage.

CONDITIONS: Given information and diagrams about team coverage.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering team coverage.

(This objective supports SM Task 113-577-2036, Document Military Operations with Motion Media.)

Lesson 3: PREPARE MOTION PICTURE SLATES AND CAPTIONS

TASK: Describe various types of slates and captions.

CONDITIONS: Given information and diagrams about slates and captions.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering slates and captions.

(This objective supports SM Task 113-577-5007, Film with Double System Sound.)

THIS PAGE INTENTIONALLY LEFT BLANK

INTRODUCTION TO DOCUMENTATION CINEMATOGRAPHY

These three lessons on documentation cinematography are designed to teach you the methods of using cinematography to document subjects for your unit. Army Visual Information units are becoming more tactically oriented and will require efficient documentation. Most of this camera work will be performed in the field. The techniques in this subcourse are designed for both motion picture and television specialists. The methods are suitable for motion picture and television cameras. Your ability to support the Army with usable motion picture footage may well spell the difference between mission failure and mission accomplishment.

The term "visual information" has replaced "audiovisual" in the Army of excellence.

LESSON 1

FILMING TECHNIQUES

TASK

Describe the various techniques of filming subjects for Army documentation purposes.

CONDITIONS

Given information and diagrams describing various techniques.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering filming techniques.

Learning Event 1:

DESCRIBE DOCUMENTATION PHOTOGRAPHY

1. Army documentation still photography has been in existence since the camera was first invented. All military actions and functions have been documented over the years since the motion picture camera was invented. Documentation of the Army is a continuing function of Visual Information (VI) units in times of peace and war. Motion picture and television are becoming interoperable and the term motion media represents both types of equipment and techniques. Of course, in the Civil War, only still photo cameras were used.

a. Peacetime documentation includes documentation of training, medical research and development, public affairs, and historical subjects. It is used to tell the Army story and to record its missions.

b. Combat documentation (COMDOC) consists of the above and also includes coverage of combat (C), combat support (CS), and combat service support (CSS) unit missions. Visual Information (VI) COMDOC activities support command and Army missions, and US national objectives.

c. VI Combat documentation support teams will be engaged in motion media operations on day one of any battle. In some cases the documentation may start 24 hours before hostilities begin.

2. Combat (tactical) documentation covers the following:

a. Battlefield documentation, which extends from the forward line of troops (FLOT) to Corps, consists of the following types of media coverage:

(1) Military operations from day one of the battle and information of immediate value to commanders and their staffs for use in planning, conducting and evaluating combat, combat support, and combat service support effectiveness.

(2) Friendly positions before, during, and after the battle. This includes providing front and reverse panoramics, camouflage discipline, and fields of fire.

(3) Opposing forces (OPFOR) positions should also be documented, if possible, to detect camouflage and possible avenues of approach.

(4) On the scene close-in terrain analysis documentation for operational traffic supportability planning, barrier location and identification.

(5) Aerial spot imagery which provides motion media of friendly and OPFOR positions to augment intelligence photography.

(6) Military operations to furnish HQDA staff, training developers, and military historians with combat and doctrinal material for evaluation and development of effective counter measures.

(7) Battlefield damage of friendly force equipment to provide operational tacticians and logisticians immediate information to develop effective counter measures.

(8) Battlefield damage to indigenous property for use by Civil Affairs in adjudicating claims.

(9) Battlefield damage of OPFOR equipment to provide operational tacticians and logisticians immediate information on effectiveness of friendly weapons and tactics and to provide information for long-range research and development activities.

(10) Field medical procedures as required by the field medical commander, to furnish visual and audio information of immediate intelligence and operations value.

(11) Initial battle engagements of new weapons and support systems and revised tactics to provide HQDA staff and commanders and their staffs at all levels, and Combat, doctrinal, material and training developers, information for validation of new equipment doctrine.

(12) Visual documentation of captured OPFOR supplies, material, equipment, personnel and documents for commanders and their staffs at all levels for use in planning, conducting and evaluating combat, combat support and combat service support activities. This material may be of

immediate importance to the Intelligence, Psychological Operations (PSYOPs), Military Police and Public Affairs communities and will be ultimately used by military historians.

(13) This coverage is usually conducted in the division area of responsibility.

b. Combat documentation of the Corps consists of, but is not limited to, the following:

(1) Support PSYOPs by providing documentation of prisoners of war (PW); morale, welfare, and condition of clothing and equipment; and the affect of battle on the civil population.

(2) Support military police by providing documentation of PW identification and enclosure construction, PW morale and welfare, adequacy of control procedures, and visual information support for investigation as required.

(3) Document plans and procedures for rear area protection which includes camouflage discipline, fields of fire, and reverse panoramics.

(4) Support military intelligence with documentation of captured material and damaged OPFOR or friendly equipment.

(5) This coverage is usually acquired in the corps area behind division lines.

c. Tactical documentation in Echelons Above Corps (EAC) which include Theater Army, consists of, but is not limited to, the following:

(1) Support PSYOPs operations when required (same as Corps).

(2) Support military police operations when required (same as Corps).

(3) Support military intelligence operations when required (same as Corps).

(4) Support Public Affairs News Media Centers and assists Public Affairs Units when required.

(5) Augment Corps mission requirements.

(6) Cover the deep battle.

(7) Cover the rear battle.

3. Equipment.

a. VI COMDOC support organizations are equipped with state-of-the-art motion picture and videotape, and equipment as required.

b. Organic vehicles, tentage, and other related equipment will be authorized on the VI detachment TOE. VI COMDOC team members are self-sufficient and capable of operating in the field with a 15-day basic load of supply. VI COMDOC support teams are attached to a subordinate unit with a complete basic load. Processing support is provided by Corps or Theater VI units.

Learning Event 2:
DESCRIBE MOTION PICTURE TECHNIQUES

1. Camera techniques for uncontrolled action must be mastered in order to film combat or tactical training documentation. The same basic style applies to both training and actual wartime documentation. All the techniques used to film in peacetime are also used in wartime or tactical conditions. Composition, depth of field, cut-ins, cut aways, screen direction, basic sequence and exposure are still required when shooting COMDOC. The main difference is that the surroundings are hostile and you may not always be able to shoot exactly as you wish due to battlefield situations.

a. Composition is an important part of documentation photography. All the techniques you know concerning framing, arranging, and elements of the scene are required when possible. There are times when this is not possible. Keep in mind the following points on composition.

(1) Four lines of composition include; horizontal, which indicates peace and quiet; vertical that indicates strength and power; diagonal which indicates force and action; and curved which indicates grace and charm (fig 1-1).

Figure 1-1. Meaning of lines

(2) Depth puts the viewer in the picture. Remember, your pictures or scenes are in two dimensions. You must create the feeling of depth. Depth adds direction and atmosphere to a scene.

(3) Camera angles add to a scene. Shooting from a low angle adds apparent height to a subject. A shot looking down decreases the apparent height of a subject. Shooting from the right or left of a subject can add depth and provides a look at the front and side of the subject.

b. Depth of field is an important factor when filming action. All uncontrolled action requires a complete understanding of depth of field which also includes understanding hyperfocal distance (HFD).

(1) Depth of field is the distance from the nearest to the farthest point in a scene that is in focus. It may or may not include infinity. Hyperfocal distance (HFD) is the distance from the lens to the nearest point in acceptable sharpness when the lens is focused at infinity. If you focus your lens on the HFD, everything from one half the HFD to infinity will be in focus. This gives you the greatest depth of field and always include infinity (fig 1-2).

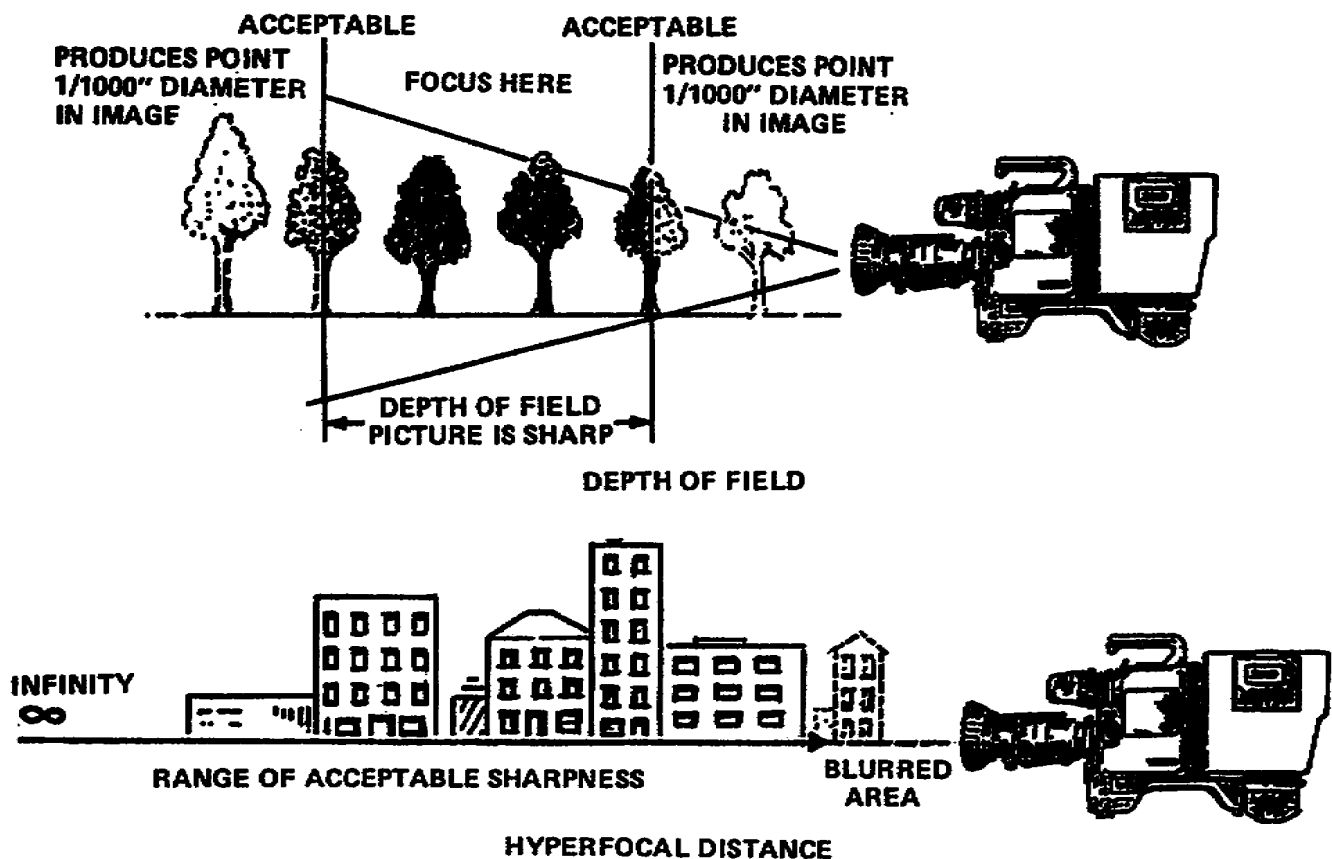

Figure 1-2. Depth of field and hyperfocal distance

(2) The formula for HPD is:

$$H = \frac{F^2 \times CC}{12 \times f}$$

- (a) Where H = Hyperfocal distance in feet
 F = Focal length of lens in inches
 cc = Circle of confusion (1/1000" for 16mm cameras)
 f = Aperture (f/stop)

(b) If you have a 25mm lens on a 16mm camera, the HPD for f/5.6 is 10 feet, 2 inches. Therefore, if you focus your lens on 10 feet, 2 inches, (the HFD), your depth of field will extend from 5 feet, 1 inch (half the HPD) to infinity.

(c) All of these formulas can also be figured in meters and millimeters. Keep in mind that focal lengths, distance and cc must all then be in meters. Do not mix inches and millimeters in the formula.

(3) Using the HFD will allow you to shoot at different distances and not have to take the time to focus. Time and stress can be your worst enemy when filming. Under combat conditions, taking time to focus each shot could cause you to miss a shot or expose yourself to unnecessary danger.

(4) The following examples in Table 1-1 are representative of HFD and depth of field. They can be used for tactical documentation purposes. For more critical purposes use the chart that comes with your lens or the formula for HFD.

DEPTH-OF-FIELD AND HYPERFOCAL DISTANCE FOR 25mm LENS								
HYPERFOCAL DIST.	40'	27'	20'	14'	10'	7'	5'	4'
	f/2	f/2.8	f/4	f/5.6	f/8	f/11	f/16	f/22
LENS FOCUS (FEET)	NEAR FAR	NEAR FAR	NEAR FAR	NEAR FAR	NEAR FAR	NEAR FAR	NEAR FAR	NEAR FAR
50	22' INF.	18' INF.	14' INF.	11' INF.	8' INF.	6' INF.	4' INF.	3' INF.
25	15' 66'	13' 18'	11' INF.	9' INF.	7' INF.	5' INF.	4' INF.	3' INF.

Table 1-1. Representative lens charts

c. Cut-ins and cutaways are always required to maintain scene continuity. In many cases they may not be shot during the filming of a specific sequence. You will probably have to shoot them after the main action has terminated. However, you must provide cut-ins and cutaways when filming under any conditions.

(1) A cut-in is a technique for maintaining continuity and for bridging gaps in action. It is usually a closeup or extreme closeup, e.g., a sequence shows two people meeting and shaking hands in a long or medium shot. The handshake is a closeup "cut-in."

(2) A cut-away directs the camera (audience) from the main action to show some parallel action that is taking place at the same time. While filming a troop review, cut away to the crowd watching, or to the reviewing stand for the expression of the general, then back to the troops marching.

d. Screen direction must be maintained whenever possible. In most cases on the battlefield, you will not be able to do this. Remember that the cut-in and cutaway can be used to cover a change in direction. In addition you can use a prominent object to orient the audience to the movement of the subject, and film around the subject to show a change in direction.

e. Basic sequence is the most important technique in filming. A motion picture or television documentation is lost without good basic sequence. The basic sequence consists of long shots (LS), medium shots (MS), closeups (CU), extreme long shots (ELS), and extreme closeups (ECU). All these shots, used in a certain sequence, will make a motion media presentation more understandable to the audience.

(1) The usual arrangement of a basic sequence is the opening shot which is a LS or ELS showing the overall local or subject. This is followed by a MS which narrows down the subject to a specific area or unit. This is followed by a CU that focuses the audience attention to the specific thought you are trying to record. After this normally comes a reestablishing shot (RS) that reminds the audience where they are.

(2) From this point on, the scenes can move from LS, to MS, to CU, back to MS, and back to CU or ECU. Remember to reestablish after a few scenes. This technique may not be possible on the battlefield but you should attempt to use the basic sequence as much as possible.

(3) The basic sequence can be used when documenting nonbattle subjects such as captured equipment, medical procedures, camouflage discipline, enemy prisoners of war (EPW) and other rear area subjects.

f. Exposure remains a critical factor in motion picture documentation. Unless your film is properly exposed, your efforts could be for nothing. Basic exposure and the use of light meters do not change on the battlefield. What does change is the surrounding events. You must understand how to use basic exposure and use it almost without thinking (fig 1-3).

BASIC EXPOSURE GUIDE							
To determine the BASIC EXPOSURE for various black and white and color films use the chart below. The chart is based on an average shutter speed for motion picture camera of 1/50 second (24 fps) and average subjects in bright sunlight (frontlighted).							
DAYLIGHT FILM SPEED (ISO Index)	10	25	50	100	200	400	
ENGLISH SYSTEM f/stops	5.6	8	11	16	22	32	45
TO USE BASIC EXPOSURE:							
1. Determine the BASIC EXPOSURE from the above chart by two simple steps:							
a. Obtain the daylight film speed index for the film you are using							
b. The correct f/stop can be found directly below the number value of the ISO index							
2. This is your basic f/stop setting for average subjects in bright sunlight (frontlighted)							
3. Adjust the BASIC EXPOSURE whenever there is a change in:							
a. Lighting conditions (side or backlighting, open shade, hazy sun, etc.)							
b. Subject brightness (lighter than normal or darker than normal)							

Figure 1-3. Basic exposure guide

(1) Remember that your exposure will be determined by the film speed, now shown as ISO, and lighting conditions. Most battlefields are dull and smokey. Fast films are a must.

(2) Most of your filming will be done at the standard rate of 24 frames per second (FPS). Figure 1-4 is an exposure guide for film with an ISO of 100.

TYPICAL OUTDOOR EXPOSURE GUIDE	
<u>Exposure Index 100</u>	Frames per second = 24 at 1/50th of a second shutter speed
<u>Lighting conditions</u>	<u>f/stop</u>
Bright sun	f/22
Hazy sun	f/16
Cloudy bright	f/11
Cloudy or open shade	f/8
Deep shade	f/5.6
*These conditions based on average subject with front lighting	
For lighter-than-average subjects: close down	1/2 stop
For darker-than-average subjects: open up	1/2 stop
For side lighting: open up	1 stop
For back lighting, subject fills frame-open up	2 stops

Figure 1-4. Outdoor exposure guide

2. The use of filming techniques must be used whenever possible both in training situations and on the battlefield. Some of the techniques will be impossible to use when you are under fire. But you can provide clear, sharp, well-exposed film for your commander if you follow the principles of motion picture filming techniques you use every day.

3. When filming a subject for intelligence, or other than public affairs purposes, place a scale alongside the subject to show size. If it is a radio, weapon, vehicle or other relatively small object, use a ruler or other form of scale. If the subject is large, such as a building, place a vehicle or other object of known size alongside the building. This will act as a scale.

a. All buildings should be filmed to show all sides, three-quarter views, entrances, windows, any special feature, and should always have a scale of some type showing.

b. Equipment must also show all four sides plus three-quarter views along with CU of any handles, knobs, nameplates, or special features (cut-ins or cutaways).

c. As an example, you are documenting a captured building containing weapons. The following set of shots should be taken.

(1) A LS showing the location of the building to include surrounding areas.

(2) A MS showing the outside of the building. This shot should have a scale of some sort. Note that the scale must be alongside the building so that its size can be measured.

(3) More MS of all sides of the building.

(4) A series of CU showing doors, windows, nameplates, address plates, and other identifying features. Each CU should be preceded by a MS or LS showing its relation to the building. Again a scale should be in the scene.

(5) After the outside of the building is documented, you must get shots inside showing what the building contains.

(6) If weapons are stored in cases, get a LS of the cases in relation to the building; e.g., are the cases in only one corner, or is the building full of cases?

(7) Next a MS showing one or two cases of weapons. Try to show any identifying marks on the cases.

(8) This is followed by a CU or ECU of the identifying marks and special features of the case.

(9) Next comes a RS showing the pile of cases.

(10) Now a MS showing a case being opened. Make sure that the case with its markings visible is the same case opened in this scene.

(11) Using the same pattern, show the weapons, special features and markings with CU and ECU shots. Again, use a scale for these shots. Have someone operate (dry fire) the weapon (if possible) while you film.

(12) Finally, back out of the room with RS and MS until you finish with a LS of the overall building and area.

4. Documentation of subjects must follow the basic techniques of filming but must include certain scenes that may not make for a "good" movie. When documenting you are mainly interested in showing the commander what happened and why it happened. If you have good exposure and camera handling techniques along with following the principle of basic sequence, you should obtain good usable documentation footage.

Learning Event 3:
FILMING FOR TELEVISION

1. A majority of all film documentation will be used on television. This includes but is not limited to field training and evaluation, combat actualities, medical, psychological operations, military police, public construction affairs events, and other military operations in peacetime and during hostilities.

2. There are special camera techniques which are used when filming for television presentation. These techniques should be followed when practical. You may not be able to follow them under combat conditions.

a. Sets and backgrounds.

(1) Wherever possible, avoid pure whites and pure blacks in your scene. TV receivers are not capable of reproducing extreme contrasts, be they color or black and white. Stay away from high and low key in the same scene.

(2) The maximum contrast ratio for TV is 20 to 1. Try to avoid broad areas of the same tonal value. Bold patterns are better than intricate detail. Avoid cutting back and forth between angles where the background is alternately light and dark. Finally, avoid large areas with bright color.

b. Lighting.

(1) The ratio of key-to-fill light should be a maximum of 2 to 1 for color and 3 to 1 for black and white. A somewhat high key with strong backlighting gives the best results. The general intensity of illumination from scene to scene should remain relatively constant. Under tactical conditions, lights and reflections cannot, nor should they, be used. The only exception would be indoors where the light cannot be seen outside. For example, if a key light is 400 foot candles, a back light should be 200 foot candles for color, or about 150 for black and white.

(2) Television has a built-in method of adding contrast to all films shown. For this reason, it is necessary to hold the contrast down when making films for TV. Although films can be printed with less contrast, it is best to film with less contrast from the beginning. Remember, the maximum contrast that TV is capable of presenting is 20 to 1. Most stations want to keep the ratio below 10 to 1. Basically, contrast ratio means that the lightest part of a picture is 30 times brighter than the darkest part, or 10 times brighter in a 10 to 1 ratio.

c. Color temperature and colored light. As with filming for theater projection, avoid mixing light sources within one scene. This is particularly true when filming in color. Mixing light sources of different color temperatures will ruin the color quality and make the film unusable. As a documentation cinematographer, you want to keep the subject as close to its natural color as possible.

d. Camera techniques.

(1) Do not use extreme long shots (ELS) when filming for TV. This is true if any detail in the shot shows. Most TV receivers are not capable of presenting detail in an ELS. For this same reason, keep long shots (LS) to a minimum. Use more medium shots (MS) and closeups (CU) than in normal filming.

(2) Composition. When filming for TV, it is necessary to frame less tightly. You must leave more room at the edge of your frame than you normally would. The first problem is curvature of the TV tube. Also, the tube aperture, that is, the frame that supports the picture tube, cuts off a portion of the edges of the film area. This is called television image cut-off. In other words, what you shoot is not what you will see on the TV screen. For this reason, we use what is known as the safe action area.

e. Safe action area.

(1) Safe action area is shown in figure 1-5. The Arriflex camera has a safe action frame built into the viewfinder. Cameras that do not have this frame built in must be used with this frame in mind. When filming for TV without a special frame in your viewfinder, leave 10 percent around the frame to allow for TV image cut-off. This is especially true when filming CUs.

(2) The safe title area (used when filming titles for TV) is even smaller. You must leave 15 percent around the frame when filming titles for TV.

Figure 1-5. Television film apertures and safe areas

f. Camera movement. The same principles apply to moving your camera for TV and theater projection. The main thing to remember is that all dolly

and zoom shots (filming with a varifocal length lens) must be extremely smooth and rather slow when filming for TV.

g. Handholding.

(1) Handholding a camera for television is no different than for any other type of filming. The camera must be rock steady. It is not easy to do. Any type of support that can be used to help in supporting your camera should be used. The body brace or shoulder pod is probably your best choice when a tripod cannot be used.

(2) Even when using a body brace or shoulder pod, you should use your body as a steady support. Make sure the weight of the camera is distributed evenly on both legs. Keep your feet apart and do not twist your body without moving your feet.

(3) When you are handholding a camera, many things must be considered -- proper exposure, framing, camera steadiness, and the weight of the camera. For these reasons you may forget about safe action area. Whenever filming for television, you must frame within the safe action area. If not, your picture will spill out and be lost on the sides of the TV screen.

Learning Event 4:
AERIAL TECHNIQUES

1. Motion picture aerial documentation photography is accomplished by Army cameramen normally flying in helicopters. Some work can be done in fixed wing aircraft. Any documentation of ground subjects is best accomplished in a helicopter. Most Army fixed wing aircraft are "low wing" and therefore unsuitable for filming ground subjects. Almost all Air Force transport aircraft are suitable due to the large doors which give an unhampered view of the ground.

2. Army aerial photography is not a substitute for Air Force high altitude reconnaissance or Army tactical and intelligence imaging such as that done by the OV-10 Mohawk aircraft. Visual information documentation from the air is interested primarily in spot imagery of selected targets from very low altitudes.

3. Aerial cinematography.

a. Pilot authority and responsibility. The pilot is the aircraft commander. He is responsible for the mission and crew. The success of the mission is of prime importance, but in no instance will the safety of the aircraft or crew be jeopardized for the sake of a film. The pilot is responsible for the issuance of instructions governing all phases of flight operation. In addition to his regular function, the pilot performs the necessary mission preparation as follows:

(1) Attends general briefings.

(2) Coordinates with other crewmembers on route, charts, targets, and items pertinent to individual crew procedures. He also supervises the completion of required forms.

(3) Attends specialized briefings for the mission.

(4) Compiles latest information relative to flight and briefs the crew.

(5) Conducts a specialized crew and emergency procedures briefings.

b. Cameraman's responsibility. As an aerial cameraman, your prime responsibility is obtaining the mission photography, you are nevertheless a member of an aircraft crew. As a crewmember, you must be familiar with crew coordination, bailout procedures, crew safety procedures, and, if the need should arise, survival procedures. The specifics of these procedures will be given to you by the aircraft commander.

(1) Remember, the pilot is the aircraft commander. He is responsible for the aircraft. However, you are responsible for obtaining the photographs. In order to accomplish this, you must let the pilot know exactly what you need. This includes, but is not limited to, the following:

(a) Altitude desired.

(b) Direction of approach.

(c) Direction of circling target.

(d) Attitude of aircraft.

(2) Keep in mind that there may be operational reasons that the pilot cannot comply with your request. Again, remember that the pilot is the commander of the aircraft and crew.

c. Safety. While flying in an aircraft, there are a number of things that you must be aware of.

(1) Keep all film, filters, and other equipment not being used in your pocket or other such place where it will not fly around in the aircraft.

(2) Do not set your camera down at any time. Keep control of it or it may fall out of the aircraft or hit some part, or control, of the aircraft causing damage to the aircraft.

(3) Do not carry any unnecessary articles of clothing or possessions. They are just more items you will have to control.

(4) Do not smoke while flying. A burning cigarette in your lap or ashes in your camera could terminate the mission.

4. Camera techniques and controls.

a. In aerial motion picture photography, three things that differ from ground photography are; choice of focal length, frames per second (fps), and shutter opening (with adjustable shutter). To some extent, the lens size is governed by aircraft altitude and the size of the image you want. The normal lens is usually suitable.

b. When shooting from a moving platform, you should use a faster shutter speed. Usually 32 to 64 fps is best. The lower the altitude or the longer the focal length lens used, the faster the shutter speed selected. Also, the faster the platform is moving, the faster the shutter speed should be. If you are filming another aircraft (air-to-air filming), or are on the ground filming an aircraft (ground-to-air filming), the normal 24 fps can be used. This does not mean that faster fps cannot be used; only that normally it is not necessary.

c. A problem you will encounter while flying in any aircraft is vibration. If you have ever filmed scenes from a moving vehicle, such as an automobile or train, you realize that vibrational motion exists. All aircraft, especially helicopters, have comparable vibrations. One of the basic rules for aerial photography is: "Make sure that the camera is well insulated from aircraft vibration."

d. When using small handheld cameras, hold them in such a way that your body insulates the camera from the aircraft. Do not allow the camera to touch the aircraft. This will transmit any vibrations to the camera.

e. It is important to remember that when shooting from a moving platform, i.e., airplane or helicopter, that the camera is moving as fast as the platform. As a result, you must not use a small-angle shutter opening if your camera has an adjustable shutter. The degree of shutter opening (DSO) must be at least 100° or more. A small DSO will give you choppy footage. This is due to the fact that the shutter is closed most of the time. As a result, the camera has moved (in relation to the ground) a great distance. If you keep your DSO greater than 100°, there will be no problem.

5. Exposure.

a. Exposure control is no different than when shooting on the ground. The use of an exposure meter is suggested. A word of caution: DO NOT take a reading that includes the sky. This is a problem encountered by all cameramen when first shooting from the air. Make sure your meter is aimed toward the ground. You may also use a gray card. Make sure the sunlight (if any) is falling on the card.

b. When setting your exposure, make sure you compensate for any change in DSO, shutter speed, and filter. The cost of sending a cameraman on an aerial mission is high. You must plan and adjust your camera with great care.

6. Lenses.

a. In most cases, you will be using a normal lens. On occasion it may be required that you use a long focal length lens. If this is necessary, you must take certain precautions. As you know, it is more difficult to hold a long lens steady. Add this to the fact that an aerial platform is very unstable and you have the makings of the most unsteady and shaky footage you will ever see.

b. If it becomes necessary to use a long focal length lens, then the following steps should be taken to keep the footage as steady as possible.

(1) Use a fast shutter speed (64 fps or faster).

(2) Ask the pilot to try and maintain a slow and vibrationless attitude.

(3) Hold the camera as steady as possible and touch the aircraft with as few points of your body as possible. Focus should always be set on infinity. To maintain this focus, tape the lens setting so it does not move.

7. Filters for black and white film.

a. One of the biggest problems the aerial cameraman has to contend with is haze. Aerial haze is the blue of the sky resulting from light reflected off the moisture in the air. At short distances, the amount of haze is too small to have any effect on film; at long distances (which most aerial filming is), the haze may be too heavy to photograph through.

b. Whenever shooting aerials, always use a filter. The heavier the haze or the higher the altitude, the darker the filter must be. Up to 1000 feet (304.7m) use a No. 8 filter (K-2, yellow). From 1000 feet (304.7m) up to 5000 feet (1523m) use a No. 15 filter (G, deep yellow). Above 5000 feet (1523m) use a No. 25 filter (A, red). In some cases, it may be necessary to use deeper filters than those recommended here. For the highest penetration of haze, the use of the infrared film and an infrared filter is recommended.

c. An important point to remember is that not all haze can be penetrated. Haze caused by fog, dust, smoke, or other solid (opaque) particles, cannot be penetrated by any combination of film and filter.

8. Filters for color film. When filming in color, it is not possible to use the same filters to cut through haze as recommended for black and white film. We can, however, use ultraviolet and polarized filters.

a. Aerial haze affects color film to an even greater degree than it does black and white film. In addition to fuzzy images, the film takes on a blue cast. Aerial filters, such as the 1A or UV 15, are used when daylight conditions cause an excess of blue to register in color film. Scenes filmed on hazy or cloudy days require the use of a haze filter. It is best to use this type of filter for all aerial shooting in color.

b. Polarized neutral gray filters can also be used with color films. This filter will darken a blue sky without affecting the color balance of the film. This filter is normally used to subdue or eliminate oblique reflections and glare from nonmetallic surfaces, thus increasing color saturation. Nevertheless, it is also used to reduce or partially clear distant haze. Remember that the polarizing filter requires a 4X (two-stop) increase in exposure.

9. Conversion filters.

a. Conversion filters are required whenever an emulsion balanced for tungsten illumination is used in daylight or an emulsion balanced for daylight is used with tungsten illumination.

b. Inferior color will result if daylight film is used with tungsten lighting, even with the recommended filter.

c. If top color balance is desired, select the film recommended for the light source and avoid the use of filters. If one film must be selected for both tungsten and daylight, use a tungsten film to photograph the scenes illuminated under tungsten light. Add a No. 85B filter when filming under daylight illumination.

10. Aerial color films.

a. There are numerous films that can be used for filming aerial footage. The film most commonly used in the military are listed in Table 1-2. Daylight color films are balanced at 5500°K.

FILM	D/T	BALANCED FOR	FILTER FOR DAYLIGHT
EKTACHROME COMMERCIAL 7252*	16/25	3200°K	85
EKTACHROME EF 7242*	80/125	3200°K	85B
EKTACHROME EF 7241*	160/	Daylight**	None

* Reversal film.

** 5500°-6000°K. (Daylight is the combination of sunlight, 5500°K, and skylight, which usually exceeds 6000°K.)

Table 1-2. Color balance of films

b. If tungsten film must be used, Ektachrome EF 7242 is a good selection. When used with a Kodak Wratten No. 85B filter, it gives excellent results under daylight conditions.

11. Types of aerial shots.

a. Horizontals. A horizontal shot is taken of such things as the side of a mountain, dam, bridge, or tall building.. It is best not to shoot at right angles to the line of flight. The apparently greater rate of travel will cause the subject to flash across the screen so rapidly that the audience will not clearly see the object filmed. This is similar to shooting fast-moving objects in ground photography (fig 1-6a). A shooting angle more in line with the line of flight will minimize this effect. Where possible, shoot at a 45-degree angle from the line of flight. Either forward or toward the rear of the aircraft is suitable. This will minimize choppy or jumpy film.

b. Verticals. Vertical motion pictures are almost never taken. However, if it is necessary to take a vertical photograph, the camera must be pointed straight down (fig 1-6b).

c. Obliques. There are two types of oblique photographs, low and high. Low obliques do not show the horizon. They are usually about 50 degrees from the vertical (fig 1-6c). High obliques show the horizon and are about 60 degrees from the vertical (fig 1-6d). These numbers are approximate and should not be considered binding. The best angle for motion pictures is a low oblique with the camera tilted about 45 degrees from the vertical.

Figure 1-6. Aerial angles

d. Light direction. Cross lighting is the best type of lighting for aerial work. Shadows falling to the side of objects give contrast, depth, and visual measurement to the scene. A combination of middle oblique angle, 45° line-of-flight angle, and side or cross lighting will result in the best type of motion picture aerial scene coverage.

12. Framing.

a. The main subject should be centered in the frame. On occasions, a small portion of the aircraft (wing tip, strut, skid, etc) will add depth to the scene. However, this technique must not be overdone. Remember that the lens should remain focused on infinity.

b. When using a camera that does not have through-the-lens viewing, you must be careful not to have parts of the plane in the lens viewing area. Watch out for window edges, air ports, and curved glass. When shooting through glass windows and doors (plexiglass), keep the lens as close to the glass as possible to minimize distortion. Whenever possible, open the window or door before filming.

13. Using basic sequences.

a. Just as in ground photography, so also in aerial photography it the basic sequence used. The long shot (LS), medium shot (MS), and closeup (CU) are used to show the target. Your establishing shot can be made as you approach the target. LS, MS, and CU may be made at various altitudes as the aircraft circles the target.

b. As an example, the LS can be made at 1500 feet (457m), and the MS at 1000 feet (304.7m), and the CU at 500 feet (152.3m). Altitudes will, of course, vary depending on the situation. Shooting as the aircraft circles the target will furnish the requisite changes of angles.

c. When shooting a target, especially from a low altitude, keep in mind the direction of the sun. Avoid having the sun behind the target. This will avoid the flare caused by the sun shining directly into the lens.

Learning Event 5: SHOOTING UNDER STRESS

1. Photography is photography under any circumstances. The only thing that changes is the location and conditions under which you must film.

a. When you are given a script and told to shoot a story, you are usually not rushed. However, when you are shooting a COMDOC subject in wartime or peacetime, the action is fast and furious. There usually is no time for advance planning. All your thinking must be done on the run and immediately. You cannot ask the subject to "hold it" while you reshoot the scene. You get one chance and one chance only. This type of situation separates the amateur from the professional.

b. If you have mastered the technique of proper exposure, focus, and framing, then you can do these almost automatically. This leaves you free to think about the next shot. You must plan ahead. You must ask yourself, where will the action move to from here? Good cameramen seem to have a sixth sense about these things. Have you heard the term "being at the right place at the right time"? It always seems that the great cameramen are there and at the right time.

c. In order to overcome the stress of shooting under a time limit, and the violence at the battlefield, it is necessary to be a master of the basics of cinematography. Proper exposure, sharp focus, and correct framing are the basics. If these can be done automatically, then you are free to concentrate on the action at hand. The first time you have to stop to think about exposure, focus, or framing, is the time you will miss the most important action.

d. If you must think about what your f/stop should be for a certain shot, or what lens to use, then you cannot concentrate on your filming. A good cameraman is so proficient that he does the mechanical portions of his job automatically. This leaves him free to be both creative and news conscious.

2. Holding the camera.

a. We have stressed that you should use a tripod whenever possible in motion picture photography. However, if you are shooting a sequence from halfway up the mast of a radio antenna, or from over the railing of a bridge, a tripod may be a handicap rather than a help. Also, working on the ground among crowds at a parade might require you to handhold the camera. There is also a possibility that on some occasion, when you could use a tripod, you may not have one with you. You can probably imagine many more instances when you will have to hold the camera to cover the action and you should be able to do it well. To become proficient, you should practice.

b. The technique for COMDOC handheld operation is basically the same for all cameras. Size and weight are the main differences between them. Generally, sound equipment is too heavy for handheld operation. This is not to say that sound cameras cannot ever be used in this manner because there is always an exception to the rule. If it means getting or not getting the shot, you will probably find some way to support even the heaviest of cameras. Our discussion here, however, applies only to practical use of handheld cameras.

c. Success or failure in handheld camera operation depends primarily on the proper stance.

(1) First, you must stand with your feet about 18 inches (45.72 cm) apart for good support and to help prevent body sway.

(2) Next, hold the camera with both hands and use any aids, such as leather straps, etc, that the manufacturer may provide on the camera. Many cameras are made to rest naturally against your forehead as you look through the viewfinder, thus providing another point of support.

(3) Finally, pull in your elbows and, if you can, press them firmly against your sides while filming the scene.

d. Practice the proper stance while holding a camera and see just how steady you can be. It will also help if you can hold your breath while shooting -- provided the scene isn't too long. This eliminates the rise and fall of your chest. And when you assume the stance, try to relax. Being tense can actually cause your muscles to jerk and vibrate, producing the very movement you are trying to eliminate.

e. Another technique vital to good handheld scenes is the ability to shoot a smooth pan or follow shot. The method is to hold the camera the same way you would for any other handheld shot, except that in this case you face your body toward the direction in which the action will be going as you finish the scene. Then, keep your feet in place but turn your body towards the subject. This is much like winding a spring but you wind your body instead. Start filming the subject as it approaches and turn your body as the pan is taking place. As the object is passing by, your body gradually unwinds and you are in a comfortable position as the scene ends.

f. A good point to remember in handholding any camera is to take advantage of any stationary support you can find available. A telephone pole, tree, truck hood, or even another person will assist in steadying your camera. The main thing to remember is that whenever possible, use a tripod. However, when this is impossible, then use anything you can to support your camera. It is very difficult to handhold a camera properly. Any help you can get in the way of a support should be used.

3. Body braces. There are a number of items available to assist you in handholding a camera. These supports attach to the tripod socket of a camera. Most have a half circle brace that fits over your shoulder. Another extension rests on the abdomen. This distributes the weight of the camera over a large part of your body. Another type is similar to a rifle stock with an open half circle that fits around the shoulder. The main purpose of the brace is to relieve your arms of the weight of the camera, making it easier to handhold a camera.

4. Shoulder pods. Almost all newer motion picture and television cameras have shoulder pods and are designed to be placed on the shoulder. This makes carrying and holding very simple. The camera is placed on your shoulder and one hand supports the camera body or lens enclosure. The other hand is free to focus or make other adjustments.

a. You must be aware of dangerous terrain or equipment at your filming location. You could fall over obstacles in your path, or back into a moving truck, tank, or other machinery. All cinematographers must always be aware of their location in relation to the surroundings.

5. Shooting under stress is an everyday occurrence for most cinematographers. It can be overcome if you understand what causes it. For the most part, it is the fear of not getting the shot. Everyone is scared on the battlefield. If you are a master of your craft, you will have one less thing to be scared of. Remember that shooting under tactical conditions still requires all the same camera techniques used when shooting a production in the studio.

LESSON 1
PRACTICE EXERCISE

1. What must you NOT do while performing aerial documentation?
 - a. Hold your camera tightly
 - b. Stand up in the aircraft
 - c. Smoke
 - d. Talk
2. You are documenting a subject from a helicopter. What can you do to add depth to the scene?
 - a. Use a wide-angle lens
 - b. Use a telephoto lens
 - c. Show part of the aircraft
 - d. Shoot from various altitudes
3. You are filming an aerial mission. What frames-per-second should you use?
 - a. 8
 - b. 16
 - c. 24
 - d. 32
4. What must be included in a documentation film used for intelligence purposes?
 - a. Dated slate
 - b. Exposure
 - c. A scale
 - d. Name of intelligence unit
5. You are documenting a subject that you know will be on television. What is the maximum contrast ratio you should use in the scenes?
 - a. 2 to 1
 - b. 5 to 1
 - c. 10 to 1
 - d. 20 to 1

LESSON 2

PERFORM TEAM COVERAGE

TASK

Describe the various methods of conducting team coverage.

CONDITIONS

Given information and diagrams about team coverage.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering team coverage.

REFERENCES

FM 11-40

Learning Event 1: TYPES OF COVERAGE

1. Coverage of some types of missions requires more than one cameramen. However, the fact that you have a group of cameramen on a mission does not guarantee that the mission will be covered properly. There are many reasons for missing footage even when more than one cameraman is working. Winding the camera, refocusing, setting the f/stop, changing the camera viewpoint, loading or unloading, and any number of unpredictable events could keep you from filming all the action. Team coverage is two or more cooperating cameramen in a coordinated effort to cover one mission. It is important that each cameraman cooperate. If not, they may both be loading cameras at the same time. When this happens, footage is lost.

2. Types of coverage.

a. Semipermanent. In this type of coverage, you will have one or more fixed and one or more mobile cameras. This type of coverage is suitable for missions where most of the action will pass or occur at a known point. A parade is one example. The fixed camera(s) is placed in such a manner that the main action can be observed, Long shots (LS) and medium shots (MS), and in some cases closeups (CU), can be obtained by use of different focal length lenses or a varifocal lens. One or more mobile cameras are used for the cut-ins (CI) and cutaways (CA). The mobile cameras can also provide the varying angles necessary for an interesting film.

b. Leapfrog. This method uses two cameramen alternating in getting into position. While one camera is running, the other is moving into position. When the second camera starts running, the first stops and the cameraman "leapfrogs" the second cameraman and gets into position. This type of coverage is useful when covering "key" action. An example would be a VIP tour where each stop must be covered.

c. Constant shooting. Constant shooting coverage is a technique used when the entire action from start to finish must be covered. To accomplish this, you must have two cameras and two cameramen. The first cameraman starts shooting just before the action starts and continues shooting until he runs out of film. Approximately one minute before the first cameraman runs out of film, the second cameraman starts filming the action with the second camera. He continues filming until he runs out of film. In the meantime, the first cameraman has reloaded his camera and again starts filming just before the second camera runs out of film. This procedure is followed until the required action is completely filmed. An example of this would be a very important person (VIP) making a speech that lasts 40 minutes and the maximum film load for your cameras are 400 feet (121.02m). To film the entire speech without any breaks, each cameraman would reload his camera one time. On this type of coverage an additional cameraman is normally used to shoot cut-ins and cut-aways of crowd reaction which the editor can use to make the film more interesting.

d. Sectional. Each cameraman is assigned a specific part of an action as his mission. An example would be a race. One cameraman covers the start, one the turns, and one the pits. More than one race or event can be covered in this manner.

3. Coordination of effort.

a. The first step in coordination is proper preparation. All members of a team must be aware of what the mission is and what kind and method of coverage is desired.

b. Coordination is necessary to obtain proper overlap, avoid duplication of effort, keep out of each other's field of view, obtain sufficient variety of scenes and angles, and most important, maintain screen direction.

4. Aggressive methods.

a. When we say, use aggressive methods to obtain coverage, we don't mean swing a heavy bat and clear a path to your assignment. What we mean is that you cannot be timid. You may have to film a subject in the rain. You should do all you can to keep your camera dry but it does not mean to not get your feet wet. Cameramen by the very nature of their work must get wet, cold, come close to heat stroke and get into some very scary situations.

b. We do not say that you should risk your life every time you go out on a mission. Cameramen should take advantage of every safety device and precaution that is available. However, you may have to elbow your way past a group of 6-foot-4, 250-pound cameramen that are trying to get the

same picture you are. A cameraman has to have a certain amount of aggressiveness in order to accomplish the mission. This does not mean that you have to be obnoxious.

c. You may be filming a sequence that calls for the subject to do a task that he does not feel like doing at that time. In order to control the action according to your shooting outline, you are going to have to convince that person that the task must be done. Again you must be aggressive but not obnoxious.

Learning Event 2: TEAM FILMING

1. Before a team of cameramen can go out and film an FTX, or the real thing, they must have a plan for shooting. Human nature being what it is, every team member wants to get that great shot. Team coverage does not work this way. The very title "team coverage" gives you an idea of what is required. Let's set up a scenario for team coverage.

a. The mission calls for four cameramen to cover a brigade in the attack during an FTX. The attack will include artillery, tanks, and mechanized infantry.

b. Your team leader assigns one person to initially cover the artillery, one the tanks, and two the infantry. After the battle starts, each person will have another subject to cover.

(1) The person covering the artillery will want to get shots of the movement, sitting, laying of the guns, preparing ammunition, and the fire direction center, as well as the actual firing of the guns. After this is covered, and there are no new artillery subjects to cover, this cameraman can be sent to cover other rear area action. This could be medical, mess, supply, repair, maintenance, or other Combat Support (CS) and Combat Service Support (CSS) activities.

(2) The person covering the tank action would obtain the same type of scenes of the tanks as the artillery cameraman. This includes but is not limited to; uploading equipment, assembly, moving out, convoy, moving into positions, actual firing, and maneuver. As time and the situation permits, this cameraman can then cover resupply, medical, maintenance, and various other functions.

(3) The cameramen with the infantry will cover the same types of scenes as above, plus tactical operations center (TOC) activities. After the initial coverage is complete, rear area coverage may be covered.

c. At this point the team members can be moved to any location that requires coverage. The main thing to remember is that the team should not duplicate its coverage unless it is required for specific coverage.

The team leader will provide you with guidance to reassemble at some point during the battle to adjust the coverage as necessary.

2. As a team member you must plan your shooting so as not to miss an important event and also not to saturate one subject with coverage.

3. Planning coverage. There is a saying that two minutes after the battle begins, all the plans can be thrown away and new ones made. This may be true, however, if there is no plan to begin with, how can you change it? Planning is an important requirement to visual information coverage. When you are working as a team, it is even more important.

a. Your team chief will provide the overall plan of action; location, time to report, if you will be in a separate location from each other, or together with a specific unit. Planning and coordination is more important if the team will remain with one unit. In this case you do not want to "trip" over each other getting the coverage.

b. When a small unit or area is to be filmed, each cameraman must have an assigned spot to work from. If you are assigned to film one squad or fire team, then stay with that unit and do not leave it. Your team chief may want to move you at a later time and he must be able to find you.

c. Communications are a problem on the battlefield. You will most likely not have any radio communications with the team leader. You will not be able to use the unit radio as it will be needed for tactical purposes. If you are in a rear area, and the battle is not around you, a radio or telephone may be available. Your team chief or detachment commander will make arrangements for communications when required.

4. Part of all planning is equipment. When you go into a tactical situation, you must be completely equipped both to survive and to obtain footage.

a. As a cameraman and as part of a team, you must arrive at the unit you are covering with everything you need. This includes:

(1) Camera equipment, film, charged batteries, filters, and spares (the spares being batteries, filters and film).

(2) You must also make sure you have your complete TA 50 equipment. You cannot expect to have the unit you are covering supply you with a helmet, canteen or weapon. You must make sure you have all the things necessary to survive.

(3) Visual information doctrine calls for all cinematographers to also carry a basic load into a tactical situation. This includes: rations, ammunition, and fuel for vehicles. If you will be assigned to a unit for an extended period of time, the unit you are attached to will provide resupply for food, water, and fuel.

(4) Make sure your equipment, photographic and military, is properly maintained. Keep your camera clean and all batteries fully charged at all times. Do not wait until "tomorrow" to perform maintenance.

b. Never arrive at a unit asking for help or support. You must be self-sufficient when you arrive. No well-trained unit will accept you into their "territory" if you appear untrained, ill-equipped, or out of place. You must appear professional when arriving at a unit. Training and practice will provide this professionalism. Remember, you are a soldier first and a cameraman second.

5. Proper preparation, coordination of effort, and good maintenance of your equipment are musts for any cameraman. When team coverage is concerned, it is even more important.

LESSON 2
PRACTICE EXERCISE

1. You are filming a parade, what type of coverage is recommended?
 - a. Close-up and cutaways
 - b. Cut-ins and cutaway
 - c. Semipermanent coverage
 - d. Follow the main action
2. When using semipermanent coverage, how can a long, medium, and close-up shot be obtained?
 - a. By using a mobile camera
 - b. By using a field camera
 - c. By refocusing the camera
 - d. By use of different focal length lenses
3. What type of coverage is best for shooting key action?
 - a. Sectional
 - b. Constant shoot
 - c. Leapfrogging
 - d. Aggressive methods
4. You are using two motion picture cameras. How many times do you have to reload each camera to film a 40-minute speech with a 400-foot film magazine?
 - a. Once
 - b. Two times
 - c. Three times
 - d. One magazine is enough

LESSON 3
PREPARE MOTION PICTURE SLATES AND CAPTIONS

TASK

Describe various types of slates and captions.

CONDITIONS

Given information and diagrams about slates and captions.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering slates and captions.

FM 11-82

Learning Event 1:
DOCUMENTATION SLATES

1. Motion picture slates are a very important part of filming. The slate used to identify motion picture scenes may take any one of several forms. In emergencies, cameramen on news assignments have written scene identification on a scrap of paper and photographed it before shooting the scene. In most instances, however, the slates used are more formal. They may be made up to show whatever information is considered necessary, such as the title or project number of the film, the name of the cameraman, and the number of the scene and the take. Some slates also identify the camera, the lens used, and the exposure. The date and even the time of day are sometimes shown. If you are part of a large organization employing a number of crews, the unit number or the name of the director or supervisor of the crew might be included. In short, the slate should contain all the information required for proper identification of a scene.

a. In all cases the following information should be included: name of cameraman, visual information facility or unit, subject, date of exposure, locations, film roll number, special symbols or markings, project number, if applicable, and camera and its identification number, if applicable.

b. The slate may actually be a plain piece of slate with the data lettered on it in white chalk. It may also be ruled into blocks in which essential information is inserted. For shooting sound sequences, the slate includes a clap stick which is closed sharply at the end of the filming of the slate. For shooting silent sequences, a simple slate is all that is needed.

c. When using a slate, place it in front of the camera and run off approximately 5 feet (1.52m). Remember that you must focus on the slate. Usually the focusing distance can be estimated but if you are in doubt, measure the distance to the slate, and then set the focus. The slate should be photographed so that it fills the complete frame. If the slate is too far away from the lens, the lettering will be so small that the editor will have difficulty in reading it. Then, after photographing the slate, don't forget to refocus on the scene to be photographed.

d. A typical slate is shown in Figure 3-1. This slate is a good field slate for documentation work. It is a combination information slate and color control patch. This slate is valuable to the film processing laboratory to determine color balance.

e. When you are photographing from a script, slate each scene. If you are filming without a script, use a slate only at the beginning of the roll. If, for any reason, you don't have time to photograph the slate at the beginning of roll, photograph it at the end of the roll. This is known as "end slating."

f. All documentation footage must have a slate. This applies to both film and television. Many TV cameramen will only "audio slate," that is, record the slate over the microphone. This provides no visual slate. If for any reason the sound is lost, the slate is lost. Always use a slate which is visible on the screen. Figure 3-2 shows a typical sound slate as used in motion picture filming. This type of slate is only required for double system sound.

2. Although you, the cameraman, do not derive any particular value from the slate, the film editor will be hampered, if not completely lost, when slates are not used. This is particularly true when your scenes are not shot in the same order as written in the script. In the field under tactical conditions, the slate is just as important except for different reasons. A roll of motion picture film or TV tape with no slate may very well be worthless to the commander. If he doesn't know what the roll relates to, he cannot make a decision. Always slate your film or TV tape.

Learning Event 2:
CAPTIONS FOR DOCUMENTATION

1. Captions are as important to film and television documentation as good exposure. Keep in mind that when you are in the field, you may not see your footage until it is in a completed production. For this reason, both your photographer's captions and motion picture captions must be complete and contain all the information necessary to allow the laboratory to assemble your film into a complete story.

a. Without captions, your footage or tape cannot be used. Consider the following: production laboratory may service many cameramen that are scattered all over a continent. On any given day the laboratory could receive footage from each cameraman. This film, after processing, is viewed and prepared for use in various news, documentary, or training films. While viewing the films the captions are read to get some idea what is happening and where. Suddenly a sequence of 200 feet (60.96 meters) is viewed and there are no captions. This film cannot be used.

b. Films without captions are worthless. Never submit a roll of film without a complete caption. Every caption must have the basic information necessary for identification. In addition to your name, unit, date, and subject, the summary should include the who, what, where, why, when and how.

c. Information may be lumped together in an essay-type description of the coverage or broken into outline form with individual subheadings, as shown below. Either method is acceptable as long as all pertinent items are included.

(1) Who. Give names of persons prominently shown in your film. When a group is shown, such as a team, squad, platoon, etc, captions need not include each person. Just identify the group and perhaps single out the leader for listing by name, hometown, etc. Be sure to have correct spelling. If in the military, include hometown and occupational specialty as well as a brief summary of subject's background. Be sure to include any noteworthy happening in the life of your subject(s).

(2) What. You must identify and provide pertinent nomenclature and facts concerning equipment, machinery, materials, structures, bridges, installations, and prominent landmarks or other terrain features. These items are captioned whether they are part of the main action or just incidentally appear in the background of your scenes.

(3) Where. Give the location of your story or assignment. If the location is a prominent or well-known place, just name the town or city and the state or country in which it is located. If the location is not well known, be more specific. Give the name of the town and its approximate distance and direction from one or two well-known cities, or from any prominent terrain features or landmark.

(4) Why. In many captions the "why" may not exist. Why pertains primarily to particular operational procedures in which an explanation of why this thing is being done in this particular way is a vital part of the story being told.

(5) When. The date is already given in the caption heading, but here you may add the time of day. Include time belt or whether standard or daylight saving time. The time may be particularly important on aerial coverage and in some types of intelligence coverage.

(6) Show. This item also may not apply in some film stories. However, if a film story is supposed to show how something is made or how some process is done, then it would be advisable to supplement the footage with a step-by-step description of how the entire operation, or any specifically vague portion of the operation, is accomplished. This is particularly important when the film scenes, in themselves, do not fully explain the "how."

d. If your captions are handwritten, be sure to print all names, whether persons, cities, or towns. Additional material such as maps, freehand sketches, bulletins, brochures, etc, may be attached to your captions.

2. The motion picture photographer makes notes on a photographer's caption book (Form 3315, fig 3-3) at the time the film is exposed. These captions are cross-referenced to external marks on rolls of exposed film.

Later, the photographer prepares a motion picture caption (DD Form 2537 fig 3-4 front, and fig 3-5 back.) Motion media caption sheets must be filled out as completely as possible, because they serve as the source of information for the commentary that is usually written at a later time.

a. The final caption will be made in five copies based on field caption data. The original and two copies of the DD Form 2537 are shipped in the TV/film canister, or with the media material package. One copy remains at the camera person's unit, and one copy is sent to the higher headquarters of the unit that performed the shooting.

b. The heading of DD Form 2537 is self-explanatory. The classification assigned at the office of origin will be placed in the block "Original Security Classification." If it is unclassified, it is so stated. In blocks of the heading that do not apply, enter "NA."

c. Block 14, VIRIN, must have the unit's Defense Visual Information Activity Number (DVIAN), then the type of media work performed, and the year, then other information as determined by the local activity. For example, SPC Woodrow W. Wilson shot a Video Tape Original (VTO) for the 332nd time in 1989. The VIRIN block would contain the following data: A2306 (DVIAN NUMBER)-VTO-89-WW(HIS INITIALS)-322-U.

3. Motion picture caption preparation.

a. DA Pam 25-91, Visual Information Procedures, is the guiding document concerning captions. It says that motion pictures will be captioned as follows:

(1) DD Form 2537 (Visual Information Caption Sheet) will be used for the final caption. (Figures 3-4 and 3-5 are illustrations of the front and back of the new DD Form 2537.)

(2) The heading of DD Form 2537 is self-explanatory. "NA" will be entered in blocks of the heading that do not apply.

(3) Put the summary or master caption data in block 15 (Fig 3-4).

(4) A complete description will be given for each roll of film/recording. The rolls will be numbered sequentially. All persons, locations, organizations, weapons, and equipment will be fully identified.

(5) Enter reel time and scene description in block 19 (Fig 3-5).

b. Master caption of summary.

(1) When filming a story that consists of more than one roll of film, you will find it necessary to write a cover story. This is where your background material comes into play. The cover story is in addition to the

individual roll captions. The cover story is a narrative which describes the locate, subject, and overall object of the film. It is sometimes called a master caption. You may film a sequence covering a large area or installation over a period of two or more days. It is not practical to repeat the same basic information in all your roll captions.

(2) A cover story is written to explain the overall mission. It includes a description of the filming area or organization. It contains names of commanders, a description of the mission of the unit, if applicable, and any pertinent information that will be repeated in individual captions. The cover story gives an overall picture of the story being filmed. The individual roll captions can concentrate on the details of that particular roll. The summary of Army captions, if written in sufficient detail, is a cover story.

4. The following is a list of the media type abbreviations used in the VIRIN section (block 14), such as "VTO" as used in the product identifying sequence: A2306-VTO-89-WW322-U.

- ARD - audio record disc
- ATC - audio tape cassette
- ATR - audio tape reel
- BDA - board art
- CDA - compact disc audio
- CDV - compact disc video
- IVD - interactive video disc
- LVD - linear video disc
- MCN - motion picture negative, color
- MCP - motion picture positive, color
- MGM - miscellaneous graphic media
- MPN - motion picture negative, B&W
- MPP - motion picture positive, B&W
- MMM - multimedia
- OTT - overhead transparency
- SCN - still photo negative, color
- SLT - slide/tape
- SPN - still photo negative, B&W
- SPT - still photo transparency
- SSS - slide set
- VSP - video still
- VTC - videotape cassette
- VTR - videotape reel

14. VIRIN NUMBER(S) (If not listed next to individual scene or photograph descriptions) A2306-VTO-89-[WW322-U]				
NOTE: REFER TO PARA 15b (1), (a), (b), (c), and (d) IN THE TRAINING INFORMATION OUTLINE, TASK 113- 577- 5007.				
15. DESCRIPTION OF PROJECT, EXERCISE, ACTIVITY OR EVENT BEING RECORDED MASTER CAPTION: Alpha Company, 47th Engineer Battalion, prepares defensive tank positions for the 85th Armor Battalion during the delaying action portion of the exercise. The company used M9 Armored Combat Earthmover to dig a successive series of positions for M1 tanks in the area of Kiowa Valley. SUMMARY: Exercise WINSTON BASSETT was a ten-day a division maneuver exercise conducted on the training areas of Fort Attaberry from 12-19 July 1989. All First Division maneuver and support units participate during the three phases of the exercise: defense, consolidation, and counterattack.				
16. ORGANIZATIONAL UNIT SHOWN IN PROJECT, EXERCISE, ACTIVITY OR EVENT Alpha Company, 47th Engineer Battalion, DISCOM.				
17. MAJOR EQUIPMENT OR WEAPON SYSTEM SHOWN IN THE PROJECT, EXERCISE, ACTIVITY OR EVENT M9 Armored Combat Earthmover (ACE)				
18. NAMES OF KEY PERSONS SHOWN IN THE PROJECT, EXERCISE, ACTIVITY OR EVENT PFC Mario Santiago, combat engineer, (Hometown: Evergreen, CO)

LESSON 3
PRACTICE EXERCISE

1. What information below best represents a complete caption?
 - a. Name
 - b. Unit, date
 - c. Identifies equipment
 - d. Name, unit, date, subject, and summary
2. You have just finished the slate, what is important to remember?
 - a. To readjust your f/stop
 - b. To reset your counter
 - c. Refocus on the scene to be filmed
 - d. Measure the distance to the slate
3. What happens to the film when there's no caption provided?
 - a. Use in another film
 - b. The director will use it anyway
 - c. The caption is not that important
 - d. This film cannot be used
4. How much film should be exposed while filming the slate?
 - a. 2 feet
 - b. 3 feet
 - c. 5 feet
 - d. 6 feet

FIELD TELEVISION PRODUCTION

SUBCOURSE NO. SS0547-6
(Developmental Date: 30 Jun 86)

U.S. Army Signal School
Fort Gordon, Georgia

Two Credit Hours

GENERAL

The Field Television Production subcourse, part of the Audiovisual Documentation Specialist, MOS 84F Skill Level 1 course, is designed to teach the knowledge necessary for performing tasks related to production techniques in the field. Information is provided on several tasks which are performed at increasing levels of difficulty at Skill Levels, 1, 2, and 3. The subcourse is presented in four lessons, each lesson corresponding to a terminal objective as indicated below.

Lesson 1: DEFINE FIELD TELEVISION PRODUCTION

TASK: Define field television production, describe components, functions, uses, and limitations of the Electronic News Gathering/Electronic Field Production System (ENG/EFP).

CONDITIONS: Given information and illustrations relating to field television productions.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering television production; components, functions, uses and limitations of the ENG/EFP System.

(This objective supports STP tasks listed at the end of this section.)

Lesson 2: DEFINE PREPRODUCTION RESPONSIBILITIES FOR FIELD TELEVISION PRODUCTION

TASK: Describe preproduction activities, responsibilities, and preplanning tools.

CONDITIONS: Given information and illustrations relating to the production and preplanning tools of field production.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering preproduction responsibilities and preplanning tools of field television production.

(This objective supports STP tasks listed at the end of this section.)

Lesson 3: DESCRIBE PRODUCTION TECHNIQUES FOR A FIELD TELEVISION PRODUCTION

TASK: Describe aesthetics of camera composition, skills of the cameraman, lighting on location, the role of audio, operator's maintenance, and safety requirements during a field television production.

CONDITIONS: Given information and illustrations relating to field television production techniques.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering production techniques of a field television production.

(This objective supports STP tasks listed at the end of this section.)

Lesson 4: DESCRIBE LIGHTING TECHNIQUES FOR A FIELD TELEVISION PRODUCTION

TASK: Describe aesthetics of lighting techniques on location, and safety requirements during a field television production.

CONDITIONS: Given information relating to lighting techniques during a field television production.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering aesthetics of lighting techniques on location and safety requirements for lighting of a field television production.

(This objective supports STP tasks listed at the end of this section.)

Lesson 5: DEFINE THE POSTPRODUCTION PHASE OF A FIELD TELEVISION PRODUCTION

TASK: Describe postproduction activities, viewing raw footage, editing, aesthetics, operator's maintenance, and preparing a postproduction package.

CONDITIONS: Given information and illustrations relating to postproduction.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of multiple-choice test covering postproduction activities.

(This objective supports STP tasks listed at the end of this section.)

THE OBJECTIVES FOR THIS SUBCOURSE SUPPORT STP TASKS:

113-577-1050	Operate Electronic News Gathering System/Electronic Field Production Components (ENG/EFP)
113-577-2033	Frame and Compose Pictures for Television
113-577-4029	Operate Videotape Cassette Recorder/Reproducer
113-577-1047	Establish Lighting Requirements for a Television Production
113-577-1053	Establish Audio Requirements for Audio or Television Production
113-577-1057	Establish Personnel Requirements for a Television Production
113-577-2035	Direct a Television Production
214-177-1421	Write News/Sports Copy
214-177-1422	Write Broadcast Feature Copy

THIS PAGE INTENTIONALLY LEFT BLANK

INTRODUCTION TO FIELD TELEVISION PRODUCTION TECHNIQUES

Field production work is demanding. Not all rules of studio television apply to field television production. Portable equipment can be used entirely for field production work. An Audio/Television Specialist requires knowledge in the use of portable television systems and associated capabilities to operate these units in the field. Personnel, lighting, power, and audio requirements in the field can differ from those in the studio. The soldier should be flexible in applying techniques to the production at hand.

LESSON 1
DEFINE FIELD TELEVISION PRODUCTION

TASK

Define field television production, define components, functions, uses, and limitations of the Electronic News Gathering/Electronic Field Production System (ENG/EFP) system.

CONDITIONS

Given information and illustrations about terms relating to field television productions.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering television production, components, functions, uses, and limitations of the ENG/EFP system.

REFERENCES

None

Learning Event 1:

DEFINE TV FIELD PRODUCTION, THE PORTABLE EQUIPMENT AVAILABLE, ON-THE-JOB PRESSURES AND VARIOUS MISSIONS.

1. Field productions can be demanding, tough and challenging. It takes a special kind of person to work in remote, dangerous or unusual places. Field productions are on-site television productions. They can be produced outdoors, at a remote or a nearby location, or indoors, but not in a studio. A soldier may be on the road half a year or more shooting various assignments. Or a soldier could be assigned to a COMDOC team (Combat Documentation), aptly described as photography with bullets flying.

Figure 1-1. An outdoor field television production

Figure 1-2. A combat pictorial detachment team member "on the road"

2. Maintaining audience interest is a challenge. Convey your dry material with a fresh and new approach, and capitalize on your unusual or exceptional

material. Remember, the production is not for the crew to watch but for the audience.

a. A field production is as truly a production as one in a studio, requiring high standards and professional attitude. The director is totally dependent on the cameraman in field productions for all-around footage. There are no retakes during spontaneous uncontrolled action. If his cameraman misses a shot in the studio, the director may switch to another camera, but this is not possible in the field.

b. Documentation teams in the military gather information quickly and efficiently. These videotapes may be used for training, briefings, or for medical or military operations. Documentation allows a commander to observe the strengths and weaknesses of his troops which may be helpful for future battlefield assessment. Medical personnel can view medical videotapes of procedures in the field. Recruiters use videotapes to brief individuals on different Army MOS and their respective schools. Some of the uses of documentations are:

(1) Videotaping field medical procedures to furnish visual and audio information of immediate value.

(2) Military police documentation for audiovisual support for investigations, and POW identification.

(3) Military operations documentation may be of value to commanders for use in generating ideas, conducting and evaluating combat or combat support, and is useful for staff studies.

(4) Technical intelligence documentation consists of coverage of items of material and equipment of intelligence value.

(5) Psychological operations audiovisual support provides suitable material essential to PSYOPS.

(6) Audiovisual combat support teams provide aerial documentation for commanders to plan and verify deployments.

(7) Training support is a primary mission in peacetime, necessary to maintain readiness.

(8) Remote equipment can be used in surveillance, recording terrain and other features or documenting a hazardous area.

(9) Briefings give personnel a rapid presentation of a particular situation. A videotape can replay pertinent data to the performance of a particular mission.

(10) Military events and ceremonies require documentation, with operation of portable equipment on location for parades, awards, retirements and special events.

Figure 1-3. Electronic Field Production

3. Technical advances have resulted in a unique market of quality portable equipment. The director has a large choice from which to choose for his field production. There are remote vans, camcorders, ENG/EFP systems, microwave links, low light level cameras and mobile units such as small vans, lightweight trucks or station wagons. Portable TV equipment is lightweight, flexible, and easily transported. It is becoming smaller and lighter. Today, the wristwatch television is a reality.

a. Sometimes it is out of the question to simulate outdoor action in a studio. Imagine recording a 30-minute documentary on white water rafting in a TV studio. Hollywood has facilities and a budget for such events. Military television facilities, however, do not have a "Hollywood" budget. As a rule, uncontrolled action is recorded outside the studio.

b. The remote van is a compact system used in outdoor productions. A small, but effective, control room has been erected inside the van (fig 1-4). Essentially a remote van is a full-broadcast facility with cameras on wheels.

Figure 1-4. Interior of EFP mobile unit

c. The medium-sized van (fig 1-5) is easy to drive and to park. The microwave antenna atop the truck is folded for travel. Interior of the unit contains microwave transmitter, production equipment and supplies.

Figure 1-5. Exterior of EFP mobile unit

d. The biggest systems for remotes can be mounted in large trucks or trailers. These units provide a full broadcast standard production facility. Microwave links relay program material.

Figure 1-6. Microwave links relaying program material

e. Small van units, lightweight trucks and station wagons are an alternative to the remote van. Versatile designs often include arrangements for roof-mounted cameras. These do not have full broadcast capabilities.

f. ENG/EFP means Electronic News Gathering/Electronic Field Production. The basic ENG system consists of two components, a portable camera and a recorder, with either a side case (fig 1-7) or a back pack (fig 1-8). Field productions originate outside the studio. They are called on-site, on-location, or remote productions.

Figure 1-7. EFP system with sidecase

Figure 1-8. EFP system with backpack

Figure 1-9. A combination camera/recorder

g. Technology has fashioned a combination camera/recorder (fig 1-9). One person can carry this one-unit, lightweight camcorder.

(1) Some of the new television applications in military training are training, briefing, and surveillance. Portable TV equipment can be an effective tool for commanders to train troops. You may be tasked to videotape training "on location."

(2) A majority of education and training situations in the military use the demonstration or "show and tell" method of instruction. For example, portable equipment can reduce the need to move troops from one part of a post to another, preventing costly maneuvers and in some cases, saving time by releasing troops quickly to perform their missions.

(3) A briefing is intended to give personnel a rapid presentation of a particular situation. For example, in a tactical situation, remote television equipment can record all pertinent data to the performance of a particular mission or task and be played back at another location with a speed and versatility that is not otherwise possible.

(4) Remote equipment can be easily adapted for surveillance in tactical situations. Remote television equipment will record terrain and other features of a given area that can be used to support troop maneuvers.

h. The Electronic News Gathering (ENG) assignment is a challenge. Civilian crews record news, e.g., the crisis, the surprise, the emergency or natural disaster. The ENG operator, on the job, tapes an eyewitness account of newsworthy events. The cameraman is like an objective reporter. Shooting uncontrolled action requires quick reflexes because the action occurs only once. Pressure is intense. Time, or lack of it, causes difficulty by increasing the psychological pressure. The need to get shots in some sequence, at the moment the action occurs, and maintaining objectivity, can generate stress.

(1) Solo, you without help must shoot the scenes in order, taking great care to obtain all key shots, necessary background shots and extra footage for editing purposes. You, alone, must quickly record or document all required footage. There are no retakes shooting uncontrolled or spontaneous action. You may shoot uncontrolled action on foot, in the air, or on water. In other words, one cameraman is doing the work of two or three individuals.

(2) ENG camera coverage usually conveys real life events. Generally, there is more emphasis on the picture or video, than the audio. How can you write a script for an explosion three days in advance? There may be just enough time to grab your camera and head for the site. ENG scripts are often written after the fact. These scripts have a straight reporting style and should be objective. The director may not have a basic storyline but may insert portions of video to complete a whole production. ENG coverage may contribute only a fragment of the entire production.

i. On the other hand, Electronic Field Productions (EFP) usually have more structure or plot than the ENG production. These include documentaries, instructional programs, documentation of medical techniques, and even enter-

tainment. Due to time constraints, production standards, in general, are higher for EFP and lower for ENG. Even though EFP productions do not require immediacy, there are time constraints.

(1) Since the EFP production is more structured, the crew is larger. The EFP crew, in the military, is generally a two or three-man team (fig 1-10).

Figure 1-10. An EFP crew

(2) Lightweight and hand-held camera equipment is usually battery powered from a rechargeable battery belt containing silver-zinc nickel-cadmium cells with options for the use of an onboard generator, an inverter supplied by the vehicle generator, a battery system, or powerlines (main supply).

(3) Videocassettes and cartridges have flooded the market, some with quad features and others using the helical format. The newest addition to the family of VTRs is the much heralded videocassette or cartridge. Born out of speculations in the education and home entertainment markets, the videocassette (cartridge) is off to a roaring success. It is a self-contained cassette or cartridge, somewhat larger than the common audio cassette which when inserted in the appropriate machine, records or plays back hours of color programming and sound through any conventional television system.

NOTE: Be sure to insert the record button or "little red button" into the videocassette top. Without the little red button, you cannot record.

(4) The main purpose of a tripod (fig 1-11) is to hold the camera steady at the height that gives the camera a good angle or view of the scene. For this purpose alone almost any tripod will do, from the cheapest 35mm still camera tripods sold in the photo shops, and the rather overpriced tripods sold by some of the large video equipment manufacturers like Sony, to the expensive tripods you can buy from movie and TV supply houses. As a general rule, the more sturdy and expensive the tripod, the easier it is to operate. There are two important parts of any tripod, the legs, and the head, or top portion, on which the camera is mounted. Several hundred pounds of camera can be supported on substantial tripod legs, but you may be more interested in how much weight they will add if you're planning to lug the tripod around. The tripod should let you move the camera to follow or concentrate on the action in a scene. This is where the quality of the tripod head comes in. If you want to tilt the camera mounted on the tripod up or down or to the left or right, while the camera is in use, you need to make the transition smoothly. The quality and style of the head are very important in order for you to achieve smooth transition.

(5) Camera clamps. The panning head may be clamped to a firm tubular-rail structure at a vantage point (fig 1-12).

Figure 1-11. Tripods

Figure 1-12. Camera clamps

Lesson 1
PRACTICE EXERCISE

1. What does ENG/EFP mean?
 - a. Electrical News Guide/Electrical Frequency Presentation
 - b. Electronic Newscast Graphics/Electronic Fieldgrade Performance
 - c. Electronic News Gathering/Electronic Field Production
 - d. Eyewitness News Group/Eyewitness Field Presentation
2. What are the two basic components of the ENG/EFP system?
 - a. Camera and tripod
 - b. Camera and viewfinder
 - c. Video cassette and camera
 - d. VTR and camera
3. What is the main role of the ENG operator?
 - a. Talent
 - b. Objective reporter
 - c. Artist
 - d. Still photographer
4. What is a term for the combination VCR camera and recorder?
 - a. Camera/recorder
 - b. Camcorder
 - c. Recam
 - d. Recordcam
5. How many chances do you have to shoot uncontrolled action?
 - a. Two
 - b. One
 - c. As many as required by the director
 - d. As many as your supply of tape allows
6. What type of events do ENG cameras usually cover?
 - a. Real life
 - b. Fiction
 - c. Studio productions
 - d. Combat footage

7. What generally powers the portable camera in field productions?
 - a. VTR escutcheon
 - b. RF amplifiers
 - c. Nickel cadmium batteries
 - d. Electromagnets
8. What is the purpose of the little red button?
 - a. To protect the photoelectric surface
 - b. To act as a stop button
 - c. To aid in scan conversion transfer
 - d. To act as a safety device and aid in recording
9. What is the purpose of the tripod?
 - a. To help the operator focus the zoom lens
 - b. To hold the camera steady at a height that gives the camera a good angle of view of the scene
 - c. To tilt and pan
 - d. To dolly and truck
10. Why should you try to convey "dry" material with fresh approach?
 - a. Because protocol requires this
 - b. Because it's implied in audiovisual regulations
 - c. Because you need to reinforce objectivity
 - d. Because boring productions will not hold audience attention
11. What are some of the equipment choices for a field production?
 - a. Dimmer boards, tripods, dollies and microphones
 - b. Mobile units such as small vans, lightweight trucks and ENG/EFP system
 - c. Time base correctors, pedestals and AC power adaptors
 - d. TV monitors, video tape players, and slide projectors
12. In terms of equipment, what is essential for video taping in a disaster area?
 - a. High profile, low mobility
 - b. Low profile, high mobility
 - c. Fast and accurate
 - d. Quick and clean
13. What are the applications of television in military training?
 - a. Training only
 - b. Maneuvers
 - c. Furnish video and audio information
 - d. Education, surveillance, and briefings

14. Which of the following elements are used in field television equipment?
- a. Backpack, ENG/ENP system, remote dolly, rechargeable battery
 - b. Lightweight coaxial cable, pistol-grip, large-scale remote VTR
 - c. Microwave links, ENG/EFP system, remote vans, mobile units
 - d. Videocassette camera, moving vehicle, vidicon tripod
15. What allows an ENG mobile unit to relay video information?
- a. Broadcast-quality closed circuit
 - b. Waveform monitor
 - c. Time base corrector
 - d. Microwave transmitter
16. Which of the following are terms for field productions?
- a. Portable productions, hand-held
 - b. Mobile unit photography, generic video
 - c. Remote productions, on-site
 - d. Divisional photography, vicinity video
17. Why is a bodybrace used?
- a. Safety
 - b. To increase stability of portable cameras
 - c. To prevent damage to the equipment
 - d. To give the director a better shot
18. Which of the following have made changes in the ENG/EFP industry possible?
- a. Portable vans and videocassettes
 - b. Portable cameras and backpacks
 - c. Modern circuitry and miniaturization of TV pickup tubes
 - d. Minicams and instacams

Lesson 1
ANSWERS TO PRACTICE EXERCISE

1. c, Electronic News Gathering/Electronic Field Production
2. d, VTR and camera
3. b, objective reporter
4. b, camcorder
5. b, one
6. a, real life
7. c, nickel cadmium batteries
8. d, to act as a safety device and aid in recording
9. b, to hold the camera steady at a height that gives the camera a good angle of view of the scene
10. d, because boring productions will not hold audience attention.
11. b, mobile units such as small vans, lightweight trucks and ENG/EFP system
12. b, low profile, high mobility
13. d, education, surveillance, and briefings
14. c, microwave links, ENG/EFP system, remote vans, mobile units
15. d, microwave transmitter
16. c, remote productions, on-site
17. b, to increase stability of portable cameras
18. c, modern circuitry and miniaturization of TV pickup tubes

LESSON 2
DEFINE PREPRODUCTION RESPONSIBILITIES FOR
A FIELD TELEVISION PRODUCTION

TASK

Describe preproduction activities, responsibilities, and preplanning tools.

CONDITIONS

Given information and illustrations relating to the preproduction and preplanning tools of field television production.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering preproduction activities, responsibilities, and preplanning tools of field television production.

REFERENCES

None

Learning Event 1

DESCRIBE PREPRODUCTION PLANNING, THE NEED FOR PLANNING, STATING THE OBJECTIVE IN A MISSION STATEMENT AND/OR TREATMENT AND THE DIRECTOR'S ROLE

1. Planning is the first step in your production. Without proper planning time, money and manpower will be wasted. Lack of planning translates into confusion, even crisis, resulting in inoperable equipment, inadequate crew or illogical scripting. Preproduction is the time prior to production when the director selects equipment and personnel, outlines a tentative schedule, and ensures that a script or shooting outline is written. The director visualizes and develops camera shots. Preproduction can require more time and effort than production itself. There are three questions the director must answer: Who is your audience? What will the tape be used for? Will you use a script or a shooting outline?

2. The director must also have an equipment inventory, a meticulous list of all equipment and accessories. The checklist must be 100 percent accurate. Without adequate operational equipment, you cannot videotape a production. If the crew is careless, or in a hurry, vital equipment may be left behind. Once you are on site, it is not possible or practical to return to the shop. If the equipment is missing or inoperable, you are out of luck.

Figure 2-1. The director is "the boss"

3. The director must be a forceful and creative individual to survive. It is on his ambition and authority that things happen. Television production is a "team effort" with one boss (fig 2-1). That boss is the director.

a. In preproduction, the director has the bulk of preproduction responsibilities. Key responsibilities include developing an equipment inventory and checklist, selecting personnel, and ensuring script or shooting outline is written. If practical, the director will perform a remote survey or on-site survey. After the script or shooting outline is finished, the director begins to visualize his key camera shots. He literally pictures the production in his mind.

b. A mission statement is a clearly stated objective. It defines the purpose, goal, or objective. The director answers the question, what is the mission? When writing the mission statement, know what the tape will be used for and what the message will be. The director must know what the viewer will be able to glean from the final tape; information, instruction, or entertainment. A program works best when it gives a combination of all three.

c. In preproduction meetings, the director will explain the mission to the crew. One purpose of this meeting is to give the cameraman a scene-by-scene breakdown of the footage expected. Plan preproduction strategies during the meetings. Time frames, deadlines, visual style, and standards will be spelled out; a briefing given on the location, equipment to be used, and personnel on the crew. During preproduction meetings, the script or shooting outline is a rough sketch of what the cameraman will videotape. The director then outlines a tentative schedule. If, however, your director is very general about what is expected; then you are on your own. At times like that it is best to shoot for who, what, where, why, and how.

d. A remote survey describes in detail the remote site and discloses general conditions. Scouting the location before hand is an excellent idea. The following is an example of pertinent questions to ask:

- (1) Where is the exact location? (Address or grid coordinates.)
- (2) Where is the nearest telephone, if any?
- (3) Who is the Point of Contact (POC)?
- (4) When is the production to be shot?
- (5) What are the power requirements?
- (6) What are the camera positions, cable runs?
- (7) What are the lighting requirements?
- (8) Does available light need to be supplemented?
- (9) Is a portable lighting kit needed?
- (10) Are there large objects or buildings blocking the camera's view?
- (11) What will be the location of the sun?
- (12) Where will the major action areas be shot?
- (13) Is a generator needed to power the lights?
- (14) What are the transportation arrangements?
- (15) Is it necessary to make arrangements for meals, overnight accommodations or overnight security for the equipment?
- (16) If applicable, what are the room measurements?

e. The director goes through a process where he reads through and marks the script or shooting outline. This is called the read-through. At this time the director pictures or visualizes the camera angles and camera positions.

(1) Determining camera angles requires a process called visualization. The director must picture the production in his mind scene by scene. This is thinking in images, in pictures.

(2) Choosing personnel generally means choosing the best. A good director knows the strengths, weaknesses, and potential of his crew.

f. The director starts the creative process. He must develop a story board (if needed), and put together a script or script outline. The kind of script chosen will depend on the type of program.

(1) To shoot a particular scene, the director must arrange camera and audio coverage for the shots. The director will mark the camera positions needed and locate the mikes. The resultant rough production plan (camera plan), together with the script-margin action notes or sketches, form the basis for the production. Even the biggest productions can be analyzed into shots or sequences in this way.

(2) Once a remote survey has been prepared it is time to examine the production treatment: evaluate, discuss, anticipate practical problems and so on. The outlines should also propose other contributions such as lighting treatment and audio effects. Other considerations are documentation, cost, manpower, scheduling, and equipment selection.

(3) Much depends, of course, on the type of show you are considering: how it is to be recorded, elaboration of treatment, any special setups, and editing facilities, etc.

Learning Event 2

DESCRIBE THE STORY BOARD AND WHY IT IS USED

1. One tool in preplanning is a story board. It is a group of 3- by 5-inch cards pinned to a bulletin board. Each 3- by 5-inch card includes a simple sketch, an important or key scene on the left, and a space for narration on the right. Stick figures are acceptable. The story board can include simple sketches, photos, illustrations and/or graphics.

a. Storyboards are useful for collecting, generating and/or organizing visuals. Arrange your cards in sequence, grouping cards with similar scenes. This aids the director in seeing, scene by scene, the final production.

b. Storyboards can be used as a reference point for the script.

c. Storyboard approach. Where systematic planning is practical, a director may use a storyboard for selected key shots only, or for scene-by-scene treatment. Here we are concerned with the shot significance, salient features, a mood or style. Storyboard methods involve analyzing the script, deciding on composition of each scene and then working it out. Prerehearsal planning must be realistic. Most directors dislike rigid planning methods, preferring a more flexible approach.

2. Shot organization is a part of preplanning. It takes time to experiment with camera shots. Shots must be appropriately chosen; only the director is in a position to do this.

a. Brainstorming is useful for generating creative ideas. After brainstorming, write down likely and unlikely ideas. Later group cards together with similar ideas. The planning board is useful for organizing ideas.

b. Together the storyboard and planning board can be a reference point for writing the script. However, simpler production may not require in-depth planning. It may require a shooting outline.

Learning Event 3:

DESCRIBE A SCRIPT, HOW IT IS PREPARED, AND ITS VALUE TO THE DIRECTOR

1. A script should have unity, or wholeness, and logical development. Reinforce the basic idea. Research your materials. Consult subject matter experts. Develop and expand the key ideas of the script.

a. Although a script is open to interpretation, it does give a general direction and guidance. Think of your script as a guide. The script influences your choice of camera shots and camera angles. It indicates lighting, audio, power, and talent requirements, pacing, and style. Suppose the script specifically tells you that a man is dying. You, as director, choose a shot of the soldier's face. An extreme closeup of the face, expressing pain and imminent death, would be very powerful. Again, a script implies setting, major action, and style. How might a training tape on a field medical procedure differ in style from a documentary on California bikers?

b. The type of script depends on the complexity of the subject and the production capabilities. The director has the final say as to the simplicity or complexity of the final copy. A script should be well written and organized. Say what you want to say, as simply as possible, with the fewest number of scenes. The style should be informal, natural-sounding and quickly grasped. Do not clutter the dialogue and narrative with too many facts and figures. Some suggested steps to writing a script are: research, brainstorming, outline, treatment, and finally, the scenario.

(1) If you are writing a script on drug and alcohol abuse, research the existing literature on drug addiction and alcoholism. Collect your research material, then evaluate. This is the fact-finding stage of scriptwriting.

(2) Brainstorming can generate creative thinking. It is playing around with ideas. Write down whatever ideas come to your mind, as bizarre or outlandish as they may seem to you. Don't be afraid to be innovative. Narrow down your usable ideas through discussion with the production team.

(3) An outline is a general description or explanation of material, listing major steps or points. Outlining is arranging topics into major categories. An informal outline can provide a sufficient framework from which to write.

(4) A treatment is a scene-by-scene description of the proposed script. It answers such questions as: Will the production be in the studio or in the field? What production modes will be used? What are the results of the audience analysis?

(5) There are several kinds of scripts: news, documentaries, training tapes, or fictional. The news writer must objectively report the news. The information should be clear and concise. The training tape should be accurate and interesting. The documentary must parallel reality. Spot announcements should be attention-getting.

(a) An audience analysis should be done before the script is written. Factors such as age, sex, rank, MOS, education level, reading level, ethnic background, religious beliefs, and knowledge of ideas presented should be considered.

(b) The TV script writer should know the limitations and capabilities of cameras and the audio recording equipment. Understanding the range of audio and visual special effects is necessary to produce a program that can be technically acceptable.

(c) The following are a few questions to ask yourself while writing: Where are you going to put your emphasis?

- Is the script practical to produce?
- Are the scenes easy to visualize?
- Is the format correct?
- Is the dialogue narrative realistic?
- Is the style natural?

c. The full script is divided into two vertical columns, one is double spaced for spoken narrative (audio), and one for video. The audio column has all narrative. Music and sound effects are identified as well as directions for talent. Narrative is double spaced, using upper and lower type. Directions, however, are capitalized and single spaced. For less complex productions, the full script is not necessarily a rigid document inhibiting all production personnel. It simply tells you what is expected each moment of production. This can be modified. The full script is a plan and details are added as the production develops.

2. For some productions, the shooting outline or outline script is sufficient. To include detailed information for lighting would be pointless. If a dialogue and/or action is spontaneous, there can be no script, only a shooting outline. As a director you must be technically and factually prepared. It is important to ensure that the subject is neither too broad or too narrow and that there is sufficient time. After researching, the idea may prove to be unworkable or dull. The sooner the producer decides that an idea is workable, the better. A promising idea does not always result in a promising production.

Lesson 2
PRACTICE EXERCISE

1. What is the first step in any professional production?
 - a. Select crew
 - b. Write script
 - c. Lighting
 - d. Planning
2. What is preproduction?
 - a. Down time prior to production
 - b. Time prior to production to plan power and lighting requirements
 - c. Time prior to production director reads through and marks script
 - d. Time prior to production when director selects equipment, personnel, ensures script is written and plans camera shots
3. Who is the final authority in a TV production?
 - a. Audience
 - b. Senior NCO
 - c. Director
 - d. First cameraman
4. What is a shooting outline?
 - a. Remote survey
 - b. Another term for script
 - c. Scouting the location beforehand
 - d. Rough sketch of what cameraman will videotape
5. What is the purpose of a remote survey?
 - a. To determine visual style
 - b. To give cameraman scene by scene breakdown
 - c. To outline a tentative schedule
 - d. To provide details of the remote site
6. What is visualization?
 - a. Planning visual style
 - b. Thinking in pictures
 - c. Marking the script
 - d. Organizing thoughts

7. What is a storyboard?
 - a. 3- by 5-inch cards pinned to a board, each containing a key scene
 - b. A specific guide
 - c. Another term for planning board
 - d. Outline for a story
8. What does the script influence?
 - a. Unity and logical development
 - b. Research
 - c. The critique
 - d. Camera shots and camera angles
9. Which of the following best describe a full script?
 - a. It is prepared in a horizontal format
 - b. It is an outline of spontaneous action
 - c. It is capitalized and single spaced
 - d. It is divided into two vertical columns
10. What is an equipment inventory?
 - a. General outline of equipment
 - b. List of all equipment and accessories
 - c. List of vital equipment
 - d. List for maintenance

Lesson 2
ANSWERS TO PRACTICE EXERCISE

1. d, planning
2. d, time prior to production when director selects equipment, personnel, ensures script is written, and plans camera shots
3. c, director
4. d, rough sketch of what cameraman will videotape
5. d, to provide details of the remote site
6. b, thinking in pictures
7. a, 3- by 5-inch cards pinned to a board, each containing a key scene
8. d, camera shots and camera angles
9. d, it is divided into two vertical columns
10. b, list of all equipment and accessories

LESSON 3
DESCRIBE PRODUCTION TECHNIQUES FOR A FIELD TELEVISION PRODUCTION

TASK

Describe aesthetics of camera composition, skills of the cameraman, lighting or location, the role of audio, operator's maintenance, and safety requirements during a field television production.

CONDITIONS

Given information and illustrations relating to field television production techniques.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering production techniques of a field television production.

REFERENCES

None

Learning Event 1:

DESCRIBE SKILLS OF THE CAMERAMAN

1. As a rule, pedestals support the camera in the television studio. Camera movements in the field, however, may require hand-held camera technique. Professional cameramen possess the grace and skill of an athlete. You have to adapt to the physical demands of the camera. In the field, you will be required to brace the camera against your body (figs 3-1a, 3-1b). The camera then becomes an extension of your body. The steady-hold technique requires calm and considerable strength. Shaky camera shots result in unusable footage. Mastering the steady-hold is a part of being a competent cameraman. Flexibility of movement is an advantage to the cameraman who can work without a tripod.

Figure 3-1a. Bracing the camera against the body

Figure 3-1b. Closeup of body brace

2. Camera movements include the pan, tilt, dolly, truck, and arc.

a. A pan is a horizontal movement of the camera lens, to the left or right, often used to follow action (fig 3-2). In a pan left, the camera lens goes to the left. Panning should not be overused because it can make the audience "dizzy." It is desirable to precede the pan with a brief, non-pan shot.

Figure 3-2. Panning with the camera

Figure 3-3. Tilting with the camera

(1) There are two reasons to pan. The first is to cover large areas of terrain or nature (the word pan comes from panorama). The second reason to pan is to follow action.

(2) Sometimes it is necessary to get a bird's-eye-view of the action. When following action, a pan is effective. The cameraman could zoom out and follow with a long shot, but that would not be as effective, since television is a closeup medium. Closeup shots are effective for television since the screen is so small.

b. A tilt is a vertical movement of the camera head, up or down (fig 3-3). It is used to follow vertical action, such as a man standing up or sitting down. A cameraman may tilt from head to foot of a stunning model to show the outfit she is wearing. Proper speed in tilting is important. If the camera tilts while the talent is standing up, the talent's-head will vanish too soon. Both a pan and tilt are used to redirect the viewer's attention.

(1) Except when following action it is best not to pan or tilt. It is generally better to avoid panning or tilting a static object. If the object is too large to be entirely included in the viewfinder, zoom to a wide angle shot (fig 3-4) or back up to a greater subject distance. When it is necessary to pan or tilt the camera over a static or stationary subject, move the camera slowly. Otherwise, the motion will appear rough and fast on the TV screen.

Figure 3-4. Using a zoom lens

(2) When panning or tilting, a long-recognized technique is to begin and end with the camera stationary. Stop the camera movement at the completion of the pan or tilt, and end the scene with the camera motionless. Do not follow one panned (tilted) scene with another. Follow shots are acceptable, panning can be covered up by having someone walk through the scene and follow.

c. A dolly is a camera movement toward the talent or away from the talent (fig 3-5). To dolly in, the cameraman moves in; to dolly out, the cameraman moves away, in a vertical line, from the action or talent.

d. A truck is a lateral movement of the entire camera, to the right or to the left (fig 3-6).

Figure 3-5. Dolly movement

Figure 3-6. Trucking movement

e. An arc is an arched dolly or truck movement of the entire camera (fig 3-7).

Figure 3-7. Arc movement

3. The technique for hand-held operation is basically the same for all cameras; size and weight are the main differences.

a. Success or failure in hand-held camera operation depends primarily on the proper stance. You must stand with your feet about 18 inches apart for good support, thus preventing body sway.

b. Hold the camera with both hands and use any aids which may be provided by the manufacturer. Many cameras are made to rest naturally against your forehead as you look through the view finder, providing another point of support.

c. Pull in your elbows and press them firmly against your sides, if you can, while videotaping the scene.

d. Practice the proper stance while holding a camera and see just how steady you can be. It will help if you can hold your breath while taping, provided the scene isn't too long. This eliminates the rise and fall of your chest. Try to relax, being tense can cause the muscles to jerk, producing jerky footage.

e. You must strengthen your skills as a cameraman. If it is possible, practice your skills as follows:

(1) Maintain subject size as a talent walks towards or runs past camera.

(2) Maintain focus, follow a moving object, maintaining focus as a subject approaches or moves away.

(3) Practice finding, focusing and composing a scene during unfolding action. The purpose is to find the object, focus and compose quickly and accurately.

(4) Practice tracking, following an object, such as a horse, while maintaining good composition. The horse should be properly framed with proper lead space.

(5) Practice steady-hold. Hand-held camera work can only be done by a calm person who possesses adequate strength.

(6) Find as many interesting shots as possible from a single camera position.

(7) Look for difficult shots.

4. Types of transitions. A simple method of going from scene to scene is a transition. These include the cut, blackout, swish pan, fade-to-black, defocus/refocus, and black surface. There is also the sound transition and montage. The director creates an appropriate transition.

a. Black out. Talent walks toward the camera until the entire picture is blacked out from lack of light. The next scene may start with the talent walking away from the camera.

b. Swish pan. A swish pan is used to show a change in time or a change in place, between scenes. A swish pan is a quick pan where everything blurs. After the swish pan, cut directly to the next scene. Or cut to a quick pan, stopping directly on the new subject. Its success depends on the right speed and smooth movement.

c. Defocus/refocus. Defocus the lens. The image becomes blurred. Start next scene out of focus. Go into focus. This implies a change of time or scene.

d. Black surface. Using a black surface or uniformly colored surface, zoom in and then cut. Zoom in to a blue wall, cut to the next scene. Again start on the blue wall.

Lesson 3
Learning Event 1
PRACTICE EXERCISE

1. What generally supports the TV studio camera?
 - a. Body brace
 - b. Spring harness
 - c. Pedestal
 - d. Grip
2. Which of the following is the term for bracing the camera against the body?
 - a. Steady state
 - b. Bracing technique
 - c. Pan
 - d. Steady-hold
3. What is a pan?
 - a. Cookery for an FTX
 - b. Vertical movement of the camera head
 - c. Horizontal movement of the camera lens
 - d. Camera movement toward the talent
4. What is a tilt?
 - a. Bird's-eye view
 - b. Lateral movement of entire camera
 - c. A shaky movement resulting in unusable footage
 - d. Vertical movement of the camera head
5. What is a truck?
 - a. Movement in a vertical line
 - b. Slow steady movement
 - c. Follow shot
 - d. Lateral movement of entire camera
6. What is a transition?
 - a. Tracking without a tripod
 - b. Simple method for going scene to scene
 - c. Abrupt change in script style
 - d. Sudden change in viewpoint

Lesson 3
Learning Event 1
ANSWERS TO PRACTICE EXERCISE

1. c, pedestal
2. d, steady-hold
3. c, horizontal movement of the camera lens
4. d, vertical movement of the camera head
5. d, lateral movement of entire camera
6. b, simple method for going scene to scene

Learning Event 2:
DESCRIBE FRAMING THE PICTURE

1. Good framing is fundamental to a good picture. Without good framing techniques, everything else is useless. For instance, tight framing emphasizes the screen's confines. Head movements can pass out of the frame, requiring catch-up panning, an obtrusive operation (fig 3-8).

Figure 3-8. Avoid tight framing

a. Allow enough headroom for the subject. Too little headroom creates tension within the TV screen. For good vertical balance, avoid the cramping effect of insufficient headroom or a bottom-heavy effect of excess room. The compositional elements can become incidental borders, depending on how they are formed (fig 3-9).

Figure 3-9. Appropriate and inappropriate headroom

b. The natural cutoff lines for people (fig 3-10) are:

- (1) Eyes, nose, or mouth line
- (2) The chin
- (3) The bust
- (4) The waist
- (5) Hands at sides
- (6) Hemline (for females)
- (7) Knees
- (8) Ankles

Figure 3-10. Cutoff lines

c. There is a transmission loss of about 10 percent when framing. To compensate, you need to assume that 10 percent of video around the edges will be lost (fig 3-11).

Figure 3-11. Transmission loss

d. When following the action of a person or object, provide enough lead room (fig 3-12).

Figure 3-12. Lead room

e. Nose room. Whenever subjects look offscreen, frame them with more room in the direction of the look. In the first frame (fig 3-13a) the subject looks as though she is being pushed by the right side of the TV frame. In the second shot (fig 3-13b) the additional room produces a more effective composition.

Figure 3-13a. Nose room, incorrect positioning

Figure 3-13b. Nose room, correct positioning

f. Placing the subject at the edge of the screen creates tension, unless a dramatic effect is required (fig 3-14).

g. Frame a person or object towards the center or near center of the screen for stability (fig 3-15).

Figure 3-14. View with subject at edge of screen

Figure 3-15. Subject near center of screen

h. Putting them exactly in the center of the screen can cause a certain amount of boredom in the audience, especially over a period of time. Unless required for dramatic effect, putting a person in the exact center of the screen should be avoided (fig 3-16).

Figure 3-16. Subject in exact center of screen

i. Avoid juxtapositioning subjects and objects. If you place a talent in front of or beside a set or prop in such a way that it appears to grow out of their side, head, or body, that is juxtapositioning (fig 3-17).

Figure 3-17. Juxtapositioning, poor placement of talent in relation to sets or props

2. Every photograph should have one definite center of point of interest which is supported by the remaining elements. The placement of the principal subject or action to gain its center of interest allows the viewer to use all the meaning of the photograph more clearly and quickly. To locate the ideal site for the center of interest, consider the scene as a tick-tack-toe board. Place the principal subject on one of the intersections (fig 3-18).

Figure 3-18. Ideal sites for center of interest

a. Another point to consider is on which of the four intersecting points to place the principal subject. The following rule should help. If the subject is facing right, place it on one of the two points on the left (fig 3-19).

b. If facing left, place it on one of the two points on the right (fig 3-20).

Figure 3-19. Subject facing right

Figure 3-20. Subject facing left

c. If the subject is looking up, place it on one of the bottom two points (fig 3-21).

d. If subject is looking down, place it on one of the top two points (fig 3-22).

Figure 3-21. Subject looking up

Figure 3-22. Subject looking down

(1) The rule of thirds states that the ratio of the length of the smaller part of a line to the larger part of that line equals the ratio of the larger part of the whole line. This ratio of 2:3 is used to locate the placement of the center of interest. It works out that this point of placement is $\frac{2}{3}$ of the picture width from either side and $\frac{2}{3}$ the picture height from top to bottom (fig 3-23).

Figure 3-23. Using ratio of 2:3 to place center of interest

(2) The center of interest should never be located at dead center of the scene. This creates a hypnotic effect on the viewer. The viewer's eye goes directly to the center almost immediately and will stay there. The viewer will see only that one point. The rest of the photograph is lost. The command of the viewer's attention is also lost if the center of interest is placed near the edge of a photograph. This brings the viewer's gaze to the edge of the picture and might move his attention away from the picture completely.

e. When framing two people, center them (using the vertical and horizontal lines) from the rule of thirds (fig 3-24).

Figure 3-24. Framing and centering two people

f. Placing two subjects too close to each other or too close to the edge of the screen creates tension and a lack of balance. Note in Figure 3-25 the subjects are positioned along the edges of the screen and the most important central screen space is empty. The solution is either to move the subjects closer together or to change the camera angle to reduce the central space.

Figure 3-25. Too much screen space

Lesson 3
Learning Event 2
PRACTICE QUESTIONS

1. What is the effect of too little headroom?
 - a. Tension within the TV screen
 - b. Emphasizes confines of TV screen
 - c. Bottom-heavy effect
 - d. Oppressive overhang
2. What are natural cut-off lines in shooting persons?
 - a. Above waist, above knees
 - b. Compositional elements along border
 - c. Chin, bust, waist
 - d. Within safe action area
3. What is noseroom?
 - a. More room in direction of look
 - b. Space between eyebrows and mouth
 - c. Extreme closeup of face
 - d. Using a natural cutoff line
4. Do not place a subject at the edge of the screen unless
 - a. A dramatic effect is desired
 - b. Stability is required
 - c. Juxtaposition is desired
 - d. There is too little screen space
5. What happens if the talent is placed dead center in the screen?
 - a. Absolute symmetry
 - b. Boredom
 - c. Dramatic effect
 - d. Command of viewer's attention
6. What is the term if a prop appears to grow out of a talent's head?
 - a. Rule of thirds
 - b. Diagonal matrix
 - c. Special effect
 - d. Juxtapositioning

7. Why should you frame a subject near the center of the screen?
- a. To create tension
 - b. For stability
 - c. To reduce space
 - d. To avoid cluttered look
8. Why is the rule of thirds used?
- a. For dramatic effect
 - b. To frame two subjects
 - c. To locate placement of center of interest
 - d. To follow the action of a person or object

Lesson 3
Learning Event 2
ANSWERS TO PRACTICE EXERCISE

1. a, tension within the TV screen
2. c, chin, bust, waist
3. a, more room in direction of look
4. a, a dramatic effect is required
5. b, boredom
6. d, juxtapositioning
7. b, for stability
8. c, to locate placement of center of interest

Learning Event 3:

DESCRIBE THE RELATIONSHIP BETWEEN THE BASIC SEQUENCE AND CONTINUITY

1. Continuity is the logical development of scenes. Continuity means keeping the production simple, not cluttering it up with distracting shots, ideas, or dialogue. Continuity means developing a single theme, idea or concept. It requires a certain amount of simplicity and clarity. Simplicity does not mean insulting the intelligence of the viewer, but visually sticking to the point. Don't go off on a tangent.

a. In a television production every minute detail or every action can not be shown. It would take too much time and the viewer would have to sit through hours and hours of videotape. The mind of the viewer naturally fills in the details and time lapses if the production is well done. This filling in the blanks is called psychological closure. The foundation of good continuity is the basic sequence. To tell your story, you must combine a wide variety of shots to obtain smooth visual flow of the action. The basic sequence is a most important technique. Continuity can be relayed through the basic sequence. The basic sequence is a related series of shots and is a fundamental unit in continuity. It has three simple elements, i.e., the long shot, the medium shot, and the closeup (fig 3-26).

LS—LONG SHOT

MS—MEDIUM SHOT

CU—CLOSE-UP

Figure 3-26. Sequence showing continuity

(1) The long shot establishes the scene, environment, location or locale of the action. It is an overview or bird's eye view of environment (fig 3-27).

Figure 3-27. Long shot

(2) The medium shot is the midway transition. It moves in a little closer to the action, building up the subject, allowing audience to begin to zero in on the action (fig 3-28).

Figure 3-28. Medium shot

(3) The closeup shows detail of the subject matter, creates an atmosphere of intimacy and knowledge of the subject with the audience (fig 3-29).

Figure 3-29. Closeup

b. It is important that shots in the basic sequence and its variations should portray a story or idea that makes sense. You don't want to confuse the audience. The story or documentary is developed with the long shot, medium shot, closeup, and variations. Important or key ideas are not to be left up to the imagination of the audience.

(1) Every TV production is made up of one or more sequences. A sequence is a series of related scenes composed of the long shot, medium shot, and closeup technique. Each sequence is a complete story within itself. In recording activity, the need for sequences becomes apparent.

(2) Closeups are the most interesting and important shots in the basic sequence. Television has been described as a closeup medium because of the small screen size. What may look good on the motion picture screen may not look good on the television screen. Once you have obtained what you feel are the necessary introductory long shots and medium shots, move in for the closeups. Screen-filling closeups are extremely effective and interesting and are used for emphasis when a normal closeup might fail to achieve the vivid impression desired.

Lesson 3
Learning Event 3
PRACTICE EXERCISE

1. What is continuity?
 - a. Psychological closure
 - b. Absence of time lapse
 - c. Logical development of scenes
 - d. Area and viewpoint of the camera
2. What is the fundamental unit of a related series of shots?
 - a. Script
 - b. Closeup
 - c. Overview of the environment
 - d. Basic sequence
3. What are three elements of basic sequence?
 - a. Scenes, shots, and single photograph
 - b. long shot, medium shot, and closeup
 - c. Logical development, continuity, and psychological closure
 - d. Consecutive order, coherent relationship and main and subordinate parts
4. Which shot generally establishes the scene?
 - a. Long shot
 - b. Bird's-eye view
 - c. Locale shot
 - d. Key shot
5. What does a medium shot generally do?
 - a. Creates an atmosphere of intimacy
 - b. Portrays emphasis
 - c. Moves in a little closer to the action
 - d. Gives audience time to react
6. What is a sequence?
 - a. Series of related scenes composed of long shots, medium shots, and closeups
 - b. A relationship between main and subordinate shots
 - c. Shots building towards a climactic event
 - d. Use of simplicity, clarity, and refining

7. When you use the basic sequence, what should not be left up to the imagination of the audience?
- a. Long shots
 - b. Medium shots
 - c. Closeups
 - d. Key shots
8. Which shots are the most interesting and important in the basic sequence?
- a. Long shots
 - b. Medium shots
 - c. Closeups
 - d. Keyshots
9. Which shot shows detail of subject matter and creates an atmosphere of intimacy?
- a. Long shots
 - b. Medium shots
 - c. Closeups
 - d. Key shots

Lesson 3
Learning Event 3
ANSWERS TO PRACTICE EXERCISE

1. c, logical development of scenes
2. d, basic sequence
3. b, long shot, medium shot, and closeup
4. a, long shot
5. c, moves in a little closer to the action
6. a, series of related scenes composed of long shots, medium shots and closeups
7. d, key shots
8. c, closeups
9. c, closeups

Learning Event 4:
DESCRIBE CAMERA ANGLES

1. Choice of camera angles is fundamental to style. Position the camera for the best view of the talent or action at that moment. Camera angles have power. They can manipulate audience attention and reactions by controlling what the audience sees and how they see it. Changing angles can evoke a definite attitude or emotion. The general rule states: When shooting a new scene, change the size of the image, or change the angle, or both. A change of image size only would be a long shot, a medium shot, and a closeup from the same angle. A camera angle is defined as the area and viewpoint recorded by the lens. Placement or positioning of a camera determines the area to be included in the picture and the viewpoint from which the viewer will observe. Do not forget the relationship between camera angle and viewer. Four factors determine the camera angle; camera height, angle of subject, position of camera and image size.

a. Audience reaction may be manipulated by the camera height.

(1) A normal camera angle is eye level with the subject. A normal camera angle is generally not as interesting as a high angle or low angle shot.

(2) In a high angle shot, the camera (and thus camera lens) is positioned above the eye level of a subject or above an object. The camera is looking down at the action or subject. This gives the illusion of "humbling" the subject, reducing him in size or stature. It can also give the illusion of slowing down motion. Psychologically, a high angle may suggest a loss of power or even loneliness. To show a subject in a position of inferiority, have the camera shoot down on the subject (fig 3-30).

Figure 3-30. Shooting down on the subject

(3) In a low angle, the camera is below eye level of the subject. The camera is low to the ground, looking up at the subject. The low angle dramatizes height and appears to speed up motion. This creates the illusion that the subject is powerful and dominant. Advertising often uses this angle on products for the psychological effect (fig 3-31).

Figure 3-31. Shooting up at a subject

b. The camera position determines several angles.

(1) The flat angle or head-on shot should not be used, in general, when the subject is still or stationary. There will be no illusion of depth. The flat angle can be used when the subject is running at you, head-on, toward the camera. This angle can carry the motion well (fig 3-32).

Figure 3-32. Flat angle or head-on shot

(2) The side angle is valuable for giving depth and perspective to people, objects, action. Imagine how powerful a racing thoroughbred appears from a low angle, side angle (fig 3-33).

Figure 3-33. Side angle shot

(3) The reverse angle shows the viewer opposite viewpoints (fig 3-34).

Figure 3-34. Reverse angle shot

(4) A canted angle is used very little in the military. This is accomplished by tilting the camera on its horizontal axis (fig 3-35). This angle suggests instability and excitement. Use sparingly.

c. Subject angle affects camera angle.

(1) Subject or object viewed head-on shows height and width, not depth. It has the appearance of some flat cartoon figures. That tall building viewed from an angle appears three-dimensional.

(2) A human face is best when the subject is turned 45 degrees to the camera. If lighting is good, the face, side of face, and eyes are fully on display (fig 3-36). In other words, if the camera is at the side of the subject or object is at an angle, there is more three-dimensional effect, or depth. This three-dimensional effect is also supported by good lighting and good color.

Figure 3-35. Canted angle shot

Figure 3-36. Excellent facial shot

(3) Overlapping planes is an effective way to increase the three-dimensional effect (fig 3-37).

Figure 3-37. Overlapping planes

d. Subject size or image size affects the camera angle. When the camera is close to the subject, the image will be larger, and when the camera is further away from the subject, the smaller the image or subject size. A good way to think of change of image size is long shot, medium shot, and closeup (fig 3-38). However, this is not inclusive, there are many types of shots.

Figure 3-38. Changing image size

e. Often camera angles are described in shots. These would include the two-shot, the three-shot group shot, the over-the-shoulder shot, and the reaction shot, the cut-in shot and the cut-away shot.

(1) A two-shot is two talents, e.g., a boy and a girl, the good guy and the bad guy. There are many types of two-shots. The most interesting is the two-shot in which the subjects sit or stand facing each other (fig 3-39). One of the two may dominate due to lighting, a more favorable angle to the lens, or better position or one is physically taller.

Figure 3-39. Two-shot camera angle

(2) A three-shot defines the type of scene. It also identifies the number of people; this aids in further identifying what is expected (fig 3-40).

Figure 3-40. Three-shot camera angle

(3) An over-the-shoulder shot (fig 3-41) is an effective shot, establishing a relationship between persons; it enhances the depth in the shot.

Figure 3-41. Over-the-shoulder shot

(4) A cut-in shot cuts into a portion of a scene (fig 3-42).

Figure 3-42. Cut-in shot

(5) A cut-away shot is a secondary action elsewhere, a few feet, miles or another location (fig 3-43).

Figure 3-43. Cut-away shot

(6) A reaction shot is a shot of a player reacting. He may be reacting to what someone says or does, or react to some action, such as a tornado (fig 3-44).

Figure 3-44. Reaction shot

g. Camera angles can also be defined in terms of objective and subjective.

(1) A subjective camera angle gives the viewer the illusion of personal experience. The camera acts as the eyes of the audience. The viewer feels as if he has traded places with the talent in the production and sees the event through the talent's eyes. The camera acts as the eyes of the audience. Think of the personal involvement of the subjective camera on the roller coaster. This gives the audience the illusion that he is in the scene. In other words, the camera exchanges places with the talent (fig 3-45).

(2) An objective camera angle gives the viewer the illusion that he is on the sidelines (fig 3-46).

Figure 3-45. Subjective camera angle

Figure 3-46. Objective camera angle

Lesson 3
Learning Event 4
PRACTICE EXERCISE

1. Which of the following defines camera angle?
 - a. Relationship between viewer and camera
 - b. Illusion of depth
 - c. What the audience sees
 - d. Area and the viewpoint recorded
2. Which may be directly related to camera height?
 - a. Flat angle
 - b. Audience reaction
 - c. Point of view
 - d. Horizontal axis
3. A normal camera angle is:
 - a. Head on
 - b. A medium shot
 - c. Eye level with the subject
 - d. Valuable for showing depth
4. Where is the camera positioned for a high angle shot?
 - a. Above eye level of a subject
 - b. Below eye level of a subject
 - c. Tilted on its horizontal axis
 - d. In a helicopter
5. What is another term for head-on shot?
 - a. Low angle
 - b. Straight angle
 - c. Subjective angle
 - d. Flat angle
6. What may a low angle suggest?
 - a. Power
 - b. Loss of power
 - c. Instability
 - d. Excitement

7. Why is a side angle valuable?
 - a. For depth and perspective
 - b. For height and width
 - c. For personal involvement
 - d. Easier to light
8. What does reverse angle show?
 - a. Instability
 - b. Perspective
 - c. Opposite viewpoint
 - d. Reverse image
9. There is more depth if:
 - a. Camera is tilted on its horizontal axis
 - b. Object is at an angle
 - c. The shot has detail
 - d. It is over-the-shoulder
10. Which angle is best for depth in a face?
 - a. Head-on
 - b. 45 degrees
 - c. Reverse angle
 - d. Longshot
11. What is another word for image size?
 - a. Proportionate dimension
 - b. Graphic dimension
 - c. Overlapping planes
 - d. Subject size
12. The further away the camera:
 - a. The smaller the image size
 - b. The larger the image size
 - c. No change in image size
 - d. Gives the viewer the illusion he is on the sidelines
13. A cut-away is:
 - a. Switch pan
 - b. Subjective angle
 - c. Secondary action
 - d. Dominate due to lighting

14. Which angle gives the viewer the illusion of personal experience?
- a. Objective
 - b. Subjective
 - c. Over-the-shoulder
 - d. Reaction shot

Lesson 3
Learning Event 4
ANSWERS TO PRACTICE EXERCISE

1. d, area and the viewpoint recorded
2. b, audience reaction
3. c, eye level with the subject
4. a, above eye level of a subject
5. d, flat angle
6. a, power
7. a, for depth and perspective
8. c, opposite viewpoint
9. b, object is at an angle
10. b, 45 degrees
11. d, subject size
12. a, the smaller the image size
13. c, secondary action
14. b, subjective

Learning Event 5:

DESCRIBE CAMERA SKILLS AND PRINCIPLES OF COMPOSITION

1. Composition is the creative arrangement of the subject, objects, and action. Good composition will stimulate a positive viewer response. It is an artistic blending of shape, forms, and patterns. Composition is the heart of production techniques. Composition, good composition, should give the scene an emphasis and should manipulate viewer response. You as director cameraman need to train your eyes and mind to work together to evaluate your scene's composition. Why should it be necessary to arrange the subject or objects in a picture? Why not point the camera in the general direction of the action? The explanation is this: once a frame has been placed around a scene, it matters very much how the subjects/objects of that scene are arranged within the frame.

a. There is a main point of interest in every picture. If the picture is not composed, the eye is distracted from this center of interest. There goes the audience interest. If a picture is correctly composed, it is balanced. There are no disturbing empty spaces and the eye does not have to wander over the scene looking for a focal point. There are no hard and fast rules that apply to something as creative as composition. What is good composition to one person may not appeal to another. However, there are classic guidelines. Strict devotion to these guidelines would result in stereotype camera style. Combine these principles with ingenuity and expression, and the results will be creative and stunning. Artistic composition is improved when you develop your ability to observe. The following are guiding principles to help you develop an eye for good composition:

1. Illusion of depth
2. Movements
3. Center of interest
4. Balance
5. Lines
6. Forms
7. Mass

The cameraman should master these principles of composition.

b. An important principle of composition is achieving the illusion of depth. The television screen has a horizontal format. That means the screen is 3 units high to 4 units wide. It is wider than it is high, i.e., the format is horizontal as opposed to vertical. The TV screen has no depth, only height and width.

(1) The illusion of depth must be created or the production will look flat; this will be disconcerting, or not realistic to the viewer and you will lose your viewer.

(2) The illusion of depth can be created by use of overlapping planes. This requires positioning of subjects and objects in overlapping foreground, middle ground, and background (fig 3-47).

Figure 3-47. Overlapping planes

c. Compositional movements are a particularly important aspect of motion picture and television photography. Movements may be only suggested in still photography. Movements may be suggested and shown in motion pictures. Movements can have a psychological effect on the viewer. Movements may change during a shot, or a sequence of shots, to match the change of mood or pacing. Meanings of various compositional movements may be described as follows:

(1) Horizontal movements (fig 3-48) suggest momentum or impetus. Reading from left to right allows the audience to follow left to right with little effort. Right-to-left is stronger, because it goes against the grain. Right to left movement is stronger, for opposition shots such as the good guy moving toward the bad guy.

Figure 3-48. Horizontal movement

(2) Upward-rising movement or ascending vertical movement suggests elation or freedom from earth weights. Free flight may be inferred by an upward-rising missile (fig 3-49).

Figure 3-49. Ascending vertical movement

(3) Movement directed downward, a descending vertical movement, may imply impending doom, e.g., an avalanche (fig 3-50).

Figure 3-50. Descending vertical movement

(4) A diagonal movement is most dramatic; it gives the impression of overcoming obstacles by force in battle scenes. Climbing a mountain should be shown by a left-to-upper-right diagonal. Crossed diagonals suggest opposing forces; an example would be crossed swords (fig 3-51).

Figure 3-51. Diagonal movement

(5) Curved movement such as a curved snake suggests fear (fig 3-52).

Figure 3-52. Curved movement

(6) Movement that changes direction attracts the eye of the viewer more than movement in one direction.

d. Shape is an important concept in composition, used to create balance or tension. Use the contour of an object or subject to your advantage. A single shape against a plain background can be striking. A dark form against a light background adds contrast to the scene. Several shapes, combining in a cohesive whole, result in a strong picture. Avoid scattered, non-unified forms.

(1) Regular shapes appear heavier than irregular shapes.

(2) The location of a shape inside the frame can change the picture weight. If an object or subject is lower in the frame, this implies heaviness. Higher in the frame renders a feeling of lightness. If the object or subject is centered, there is stability.

e. Lines lure the viewer's eye to the center of interest.

(1) A vertical line implies formality or dignity.

(2) Horizontal lines imply breadth or inactivity.

(3) A curved line suggests rhythm.

(4) Diagonals imply conflict.

(5) Well-defined lines are very strong, whereas a curved line is softer. The well-defined line suggests excitement, whereas the softer line suggests peacefulness.

(6) Irregular lines can be more interesting. You will need to discern what form and what line to use to best emphasize the center of interest.

f. Texture adds realism to a subject or object, adding character or special qualities. Closeups best reveal texture.

g. Depth can be suggested by proper use of the foreground and background. Whatever is in the foreground is usually dominant. For a different effect, change this dominance. Some variations of the foreground-background effect are the over-the-shoulder shot and the foreground positioning, i.e., positioning talent in foreground specifically to frame background elements.

h. A precise balance results in formality. No balance is unstable. Informal balance is generally preferred, unless you want either a formal or wild effect. There should be balancing in planes in depth, e.g., foreground and background, balance in perspective and balance in angles.

Lesson 3
Learning Event 5
PRACTICE EXERCISE

1. What is composition?
 - a. No disturbing spaces
 - b. Arrangement of the subject in the picture
 - c. Hard and fast rules that apply to creativity
 - d. Pleasing array of lines
2. What are some basic principles of composition?
 - a. Illusion of depth, center of interest, balance
 - b. Horizontal format, height and width, balance
 - c. Long shot, medium shot, and closeup
 - d. Horizontal, vertical, and diagonal
3. Horizontal movements suggest:
 - a. Travel, momentum
 - b. Aspiration, growth
 - c. Heaviness
 - d. Opposing forces
4. Diagonal movements suggest:
 - a. Crushing power
 - b. Overcoming obstacles by force
 - c. Swifttness
 - d. Relentlessness

Lesson 3
Learning Event 5
ANSWERS TO PRACTICE EXERCISE

1. b, arrangement of the subject in the picture
2. a, illusion of depth, center of interest, balance
3. a, travel, momentum
4. b, overcoming obstacles by force

LESSON 4
DESCRIBE LIGHTING TECHNIQUES FOR A FIELD
TELEVISION PRODUCTION

TASK

Describe aesthetics of lighting techniques on location, and safety requirements during a field television production.

CONDITIONS

Given information relating to lighting techniques during a field television production.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 85 percent of multiple-choice test covering aesthetics of lighting techniques on location and safety requirements for lighting of a field television production.

REFERENCES

None

Learning Event 1:

DESCRIBE LIGHTING PRINCIPLES AND TECHNIQUES

1. Good lighting techniques are critical to all TV productions. Lighting is much more than aiming a single light source. In fact, a single light, straight on, will give a flat picture, i.e., no depth. To achieve the desired result, TV production personnel must be aware of technical and artistic reasons for lighting.

a. Technically, TV cameras require a certain level of light, except for those with charged-coupled device (CCD) capabilities. The ENG/EFP cameras you will be using in the field will not function without proper light. There must be light sufficient to reproduce detail and resolution. Technically, the camera requires: (1) enough light for the camera to function and, (2) enough light for detail. There is a minimal light level necessary for technical operation; on the other hand, there is a maximum level of light the camera will accept.

b. Artistically, lighting must create the illusion of depth, space, and form; ultimately, a sense of reality. Good lighting can simulate time of day, weather, environment, atmosphere or style. Distracting features can be reduced and appealing features enhanced.

2. Television is a two-dimensional medium. That is, television shows height and width. Lighting will add the depth needed. With depth, a scene appears three-dimensional. This illusion of depth is further enhanced by proper use of camera angle, set design, color, placement of talent and set pieces. Lighting alone does not provide an illusion of depth, but without it your scene will have an amateurish flat, look.

3. Light can be described as either hard or soft.

a. Hard light is highly directional; a single stream of light pointing in a definite direction (fig 4-1). The hard light defines features well; however, the result may be harsh (fig 4-2). Hard lighting casts definite shadows which need to be diffused by another light source. Texture and form are revealed under a hard lighting source. Hot spots are a problem with hard light, causing glare.

Figure 4-1. Fresnel light in the "spot" position produces hard light

Figure 4-2. Effect of hard light

b. Soft light is diffused or scattered (fig 4-3). It is not highly directional like hard light, but nondirectional. Soft light does not create distracting shadows. Misuse of soft light will make the subject look flat, i.e., no depth. Soft, directionless light will spill over into an undesired space. It is difficult to control soft light.

c. Dense shadows can be reduced with a soft light source (fig 4-4). Remember, you do not want to eliminate shadows entirely. A good way to describe lighting is the proper use of light and shadow in proportion to each other. Good lighting means good contrast.

Figure 4-3. Fresnel light in "flood" position produces soft light

Figure 4-4. Effect of soft light

4. Direction is another part of lighting. When we talk of direction we mean the direction of light falling on a subject, not the direction the subject is facing. When you alter the direction of the light, you alter the appearance of the subject or object you are lighting. Lights may be positioned in front of, in back of, or to the side of an object or subject. With each new position, the appearance of the subject is altered.

a. Imagine you are using a clock and the light is positioned at 6 o'clock and the subject is in the center (fig 4-5). This is frontal lighting.

- (1) The appearance of the subject is flatter
- (2) Texture is diminished
- (3) Frontal lighting creates needless shadows

Figure 4-5. Frontal lighting

b. Back lighting has different results. The back light will silhouette sides of the subject (fig 4-6). This can cause a high contrast between highlights and shadows.

(1) A back light outlines all or part of the subject. This rim of light appears to separate the subject from the background.

(2) It can illuminate areas that are in shadows, although that is not the purpose.

(3) If the back light is too high the result will be stilted.

(4) Rimming caused by a back light should be used appropriately (fig 4-7).

Figure 4-6. Back lighting

Figure 4-7. Rimming or halo effect by using back lighting

c. Side lighting, often called edge lighting, is to the side of the subject or object (fig 4-8). Using a side light in conjunction with the front light will reduce the harsh shadow areas. General shape will be emphasized if the light is at the 3 o'clock position or the 9 o'clock position. Side lighting can caricature as well as emphasize detail and distort it.

Figure 4-8. Sidelighting

5. Intensity is varied by changing distance between light and subject or object. Intensity can be changed by using another size light or by using dimmers. However, too much dimming will affect the color quality.

6. Do not forget shadows.

a. Avoid positioning the talent directly in the sun. The sun should be behind the camera. Shady areas with indirect lighting are good for outdoor shooting. An even distribution of light cuts down on too much contrast.

b. Lighten the very deep shadows with fill lights. If the overall baselight is not too low, you should not have a problem with sharp difference between the shadows and the lit areas.

7. There are three main lights, key, back, and fill, used in three-point lighting. The first is the key light.

a. The key light is the principal source of directional illumination falling upon a subject or area. As the main or source light, the key should dominate whatever its direction. The key light develops desired shadows.

(1) The normal position of the key light is in front of and to the side of the subject (fig 4-9).

Figure 4-9. Key light

(2) Position and angle of key can be other than in front of and to the side. The choice of position and angle depends on the emphasis and appearance desired (fig 4-10).

Figure 4-10. Key light positioning

(3) Because it is the strongest light, the key light gives well-defined modeling of features. However, a soft light will be required to subdue harshness and unwanted shadows.

(4) Key light is a hard light; it is easily controlled and beam is easily focused.

(5) Key light is the basis for facial lighting. The eyeline is an imaginary line projecting out at eye level at 90 degrees angle (fig 4-11). Set key light 20 degrees to either side of eyeline.

(6) If there is too little key light, both sides of the subject's nose will have shadows.

(7) If there is too much key light, the contrast between light and shadow will be excessive.

Figure 4-11. Key lighting using the eyeline concept

b. Back light is behind the subject and pointing towards the camera (fig 4-12).

(1) Hard light is generally used for a back light.

(2) Back light adds a rim or halo. This rimming separates subject from background which gives the illusion of depth.

Figure 4-12. Back lighting position

(3) The camera is at 6 o'clock position and subject is in center. Backlight should be positioned at 12 o'clock at a 45-degree angle.

(4) Too much back light causes a halo effect.

(5) With too little back light it appears that the subject blends into the woodwork.

c. Fill light softens undesired shadow densities. Reduce contrast between shadows and light. Supplementary illumination reduces shadow or contrast between highlights and shadows (fig 4-13).

Figure 4-13. Fill light

(1) A fill light is generally a soft light.

(2) Position fill light at 30 degrees.

(3) Too much fill subdues facial features, e.g., cheeks, nose, and area above eyes. Subject's face will look flat (fig 4-14).

(4) Too little fill and the key will dominate; the effect may be a harsh look or be shadowy.

Figure 4-14. Fill intensity too high

8. Sunlight changes throughout the day. The position of the sun changes constantly with the hour. Remember the sun's direction and elevation when videotaping.

a. If the area is relatively small it is possible to supplement sunlight, picking out certain detail, creating patterns of light and shade.

(1) For many outside shots, there is no way to change the natural lighting conditions. You may have to change camera viewpoint or shoot from another location offering better lighting angles.

(2) If it is bright and the area is large, supplementary lighting may be ineffectual. The large daytime areas will swallow up even larger lights. On a bright day, in larger areas, it is difficult to fill in the daytime shadows.

(3) For closer shots, tungsten halogen lamps may be used as shadow fillers. However, a high power light source requires adequate power.

(4) A scrim (a gauze or mesh panel diffuser) may soften or reduce excessive sunlight (fig 4-15).

Figure 4-15. A scrim

(5) Strong frontal sunlight behind the camera has a generally flat, hard effect and may be used if that effect is sought. Colors on the subject may appear coarsely saturated.

9. Portable lighting. A portable light can be used either indoors or outdoors. If there is no AC power for hookup then a generator or batteries can be used. Quartz-halogen light sources make good portable lighting equipment by reducing the size and weight of equipment. Portable lighting usually comes in a suitcase-packed kit. It is excellent for use on small location

sites and includes lamps which can be moved to spot or flood positions, and accessories which include barndoors, metal flaps in front of a spotlight to control the light; full and half scrims, and cucalorus (kookie), a special cutout placed in front of a spotlight (figs 4-16 and 4-17).

Figure 4-16. Barndoors

Figure 4-17. Cucalorus (kookie) inserted in front of a spotlight

- a. A battery-powered light can be used anywhere.
- b. Photoflood lamps are excellent for on-site shooting; they can be attached to lightstands or a bracket.
- c. Tungsten halogen lamps are smaller lamps and emit constant color temperature in spite of age.
- d. A portable sungun is a hand-held battery-powered light. It can be used in television news gathering. The battery has a built-in charging device and will operate between 20 and 30 minutes (fig 4-18).

Figure 4-18. A sun gun can be held or clamped

f. Night lighting is possible with the portable lighting kit or lights for a smaller area.

g. If the location is naturally lit, campfire, moonlight or streetlights, lighting treatment is built up from these directions.

Lesson 4
Learning Event 1
PRACTICE EXERCISE

1. Which attracts greater viewer interest?
 - a. Continuous movement
 - b. Receding movement
 - c. Movement that changes direction
 - d. Movement in a constant direction
2. What happens if the picture is not composed correctly and the eye is led from center of interest?
 - a. There will be disturbing empty spaces
 - b. Persistence of vision will fill in the gap
 - c. There are no hard and fast rules
 - d. The value of the shot could be minimized
3. What is the effect of a single light straight on?
 - a. Helps create the illusion of depth
 - b. A flat picture with no depth
 - c. Simulates an environment
 - d. Enough light to function
4. What is a two-dimensional medium?
 - a. One that gives the illusion of depth
 - b. A normal camera angle
 - c. One that is technically and artistically correct
 - d. One that shows height and width
5. Which light is highly directional?
 - a. Fill light
 - b. Side light
 - c. Soft light
 - d. Hard light
6. A hard light defines features well, however:
 - a. It is not highly directional
 - b. It may make features appear harsh
 - c. It reduces dark shadows
 - d. It spills light into undesired space

7. What is a result of soft lighting?
 - a. Can have an abrupt effect on talent
 - b. Reveals texture
 - c. Is scattered
 - d. Causes rimming
8. What is one way to describe lighting?
 - a. Changing intensity
 - b. Proper use of light and shadow
 - c. That which is scattered to give a wide angle of illumination
 - d. Well defined modeling of features
9. Which of the following is true concerning shadows?
 - a. Should be eliminated entirely
 - b. Should not be eliminated entirely
 - c. Remove with proper back lighting
 - d. Always create an unprofessional look
10. How do you reduce dense shadows?
 - a. Pinning the beam
 - b. Highly directional lighting
 - c. Positioning light in front of, in back of, or to the side of heavy density shadow
 - d. Soft light source
11. How does the term "direction" apply in lighting?
 - a. Direction subject is facing
 - b. Single stream of light
 - c. Direction of light falling on a subject
 - d. Redirecting soft, directionless light
12. What is high relief?
 - a. High contrast between light and shadow
 - b. High separation between subject and background
 - c. High degree of illumination
 - d. Position and angle of key
13. What is a key light?
 - a. Three lights used in three-point lighting
 - b. A light that softens dense shadows
 - c. One that reduces hot spots
 - d. Principle source of directional illumination falling upon a subject

Lesson 4
Learning Event 1
ANSWERS TO PRACTICE EXERCISE

1. c, movement that changes direction
2. d, the value of the shot could be minimized
3. b, a flat picture with no depth
4. d, one that shows height and width
5. d, hard light
6. b, it may make features appear harsh
7. b, reveals texture
8. b, proper use of light and shadow
9. b, should not be eliminated entirely
10. d, soft light source
11. c, direction of light falling on a subject
12. a, high contrast between light and shadow
13. d, principle source of directional illumination falling upon a subject

Learning Event 2:
DESCRIBE LIGHT METERS

1. A light meter is accurate under many types of lighting conditions. Vision, alone, might not allow the cameraman to gauge the lighting. Resultant exposure could vary remarkably between individuals. Poor lighting can ruin even the most common or easy camera angle or shot. The intensity of a single small area cannot contrast too greatly from overall intensity. This contrast could be very obvious to the audience.

a. During the early part of the 1930's, science placed light meters in the hands of photographers. This light meter, also called exposure meter, or photoelectric exposure, measures light intensity or brightness. The meter measures the intensity of light falling on an object or subject or reflected by that object or subject.

b. Light strikes the light-sensitive surface of the meter. That surface reacts to light by generating a current. The current is in proportion to the light; the greater the light the greater the current.

c. The "meter" is simply a galvanometer, i.e., an instrument for detecting small electric current. The galvanometer movement causes a needle or light value indicator to deflect across the face of the meter scale (fig 4-19).

Figure 4-19. Types of light meters

2. Types of readings. Reflected light readings are measurements of the intensity of the light reflected from a scene or object and generally are more accurate than incident light readings, except when the prevailing light is low level (fig 4-20).

a. Use the near-object position when certain details are to be emphasized and surrounding light is in definite contrast to that reflected from the pertinent area. Hold meter near object or portion of the scene or object to be emphasized. Be careful not to cast a shadow on the object while a reflected light reading is being taken.

Figure 4-20. Reflected light meter reading

b. Incident light readings are measurements of the intensity of the light by which a scene or object is illuminated (fig 4-21). Use incident light readings to determine the best average exposure when the general illumination is at a low level. Hold meter near the object or the center of the scene and aim the meter toward the camera, in direction of the light. If the light comes from one side, point meter about halfway between the light source and the camera. Never point the exposure meter directly at the sun.

Figure 4-21. Incident light meter reading

3. Selecting suitable method for reading. Use average brightness method when scene has no outstanding or dark area and no details are required for special emphasis. Take reflected readings from camera position or near-object position.

a. Use brightest-object method when both the brightness of the darkest object and the average brightness of the scene are below range of light meter, when complete detail in the brightness portion of the scene is required and when light reading of the brightest object is required to determine the average brightness of a scene. Hold meter close to the brightest object in which full detail is desired. Disregard incidental bright spots such as a window in an interior scene or a patch of bright sunlight in an otherwise shaded area.

b. Use a reflected light reading when most important object in a scene is very dim or has adjacent reflections or bright spots unrelated to the subject and when a light reading of the darkest object is required to determine the average brightness of the scene. The method may be used for any scene.

c. Use the substitution method when it is impractical or impossible to take reflected light readings from the near-object position because the actual objects or most important are inaccessible. Take reflected readings from nearby objects that are lighted in the same manner as the inaccessible objects. Be sure the substitute object and actual object are lighted in the same way.

4. A light meter will last for a long time if you do not drop it or abuse it. Consider the following:

a. Always handle meter correctly since quality of video depends on correct readings.

(1) Do protect meter from bumping against other objects. Carry meter in your pocket or camera case when not in use. The meter case is not adequate in extreme conditions.

(2) Do not subject photoelectric cell to extreme light intensities. These intensities cause indicator needle to bounce at the high end of the scale and eventually cause damage.

(3) Do not subject the meter to extreme hot or cold.

b. Care in arctic areas. Extreme cold, i.e., subzero temperatures, and sudden changes in temperature, are both detrimental to the mechanism of the meter.

(1) Protect meter by placing meter inside jacket or in a packet and store in a warm but not hot place after use.

(2) In cold, dry weather, the window may receive a static charge that will deflect the pointer and cause a false reading. Breathe on the window to remove the static charge before taking light readings.

c. In desert regions protect meter from dust, extreme heat and sudden temperature changes. Always enclose the meter in its case when it is not actually in use and store in a cool place.

(1) Never leave the meter exposed to the direct rays of the sun.

(2) Temperatures of 125 degrees Fahrenheit and over may cause permanent damage to the light-sensitive area or to the photoelectric cell.

d. In the tropics, follow light meter readings exactly because tropical sunlight, although extremely bright, may have less effect than weaker sunlight of the moderate temperature zones.

(1) Shield exposure meter from extreme heat at all times and store it in a cool, dry, well-ventilated place when not in use.

(2) Clean frequently to prevent corrosion caused by high relative humidity.

Lesson 4
Learning Event 2
PRACTICE EXERCISE

1. When is a light meter accurate?
 - a. In sunlight
 - b. Indoors, under tungsten halogen lights
 - c. Seldom
 - d. Under many types of lighting conditions
2. What does a light meter do?
 - a. Measure intensity of light falling on an object
 - b. Measures intensity of light reflected by an object or subject
 - c. Both a and b
 - d. Measures reflected readings of inaccessible objects
3. The current inside the light meter is in proportion to what?
 - a. Temperature and humidity
 - b. DC output
 - c. AC output
 - d. Light
4. What is a reflected light reading?
 - a. Measurement of sun striking a subject or object
 - b. Measurement of the intensity of light reflected from a scene
 - c. Measurement of key light minus back light in a 2 to 1 ratio
 - d. Measurement of illumination without shadow density
5. What is a galvonometer?
 - a. Instrument for measuring best average exposure
 - b. Instrument for detecting small electric current
 - c. Instrument for transposing current values into footcandles
 - d. A light-sensitive surface
6. What is an incident light measurement?
 - a. Measurement of intensity of light by which a scene is illuminated
 - b. Measurement of fill light
 - c. Measurement of average brightness of a scene
 - d. Measurement of incidental bright spots

7. Which of the following is true about light meters?
- a. Clean frequently in arctic temperatures
 - b. Place meter inside jacket in tropics
 - c. Temperatures of 125 degrees Fahrenheit and over do not damage light meter
 - d. Never leave meter exposed to the direct rays of the sun

Lesson 4
Learning Event 2
ANSWERS TO PRACTICE EXERCISE

1. d, under many types of lighting conditions
2. c, both a and b
3. c, AC output
4. b, measurement of the intensity of light reflected from a scene
5. b, instrument for detecting small electric current
6. a, measurement of intensity of light by which a scene is illuminated
7. d, never leave meter exposed to the direct rays of the sun

Learning Event 3:
DESCRIBE REFLECTORS

1. Field productions have produced their own lighting problems. Have you noticed the deep shadows on the talent's face when sunlight comes from the side or back? How to fill in the shadows with appropriate light is a problem generally solved by reflectors which will compensate for the extreme differences in light level and lighten up the shadows. Reflectors serve the same purpose as fill lights in a studio situation. Tinfoil or aluminum foil is used for homemade reflectors.

2. Reflectors, also called reflector boards, are an inexpensive and convenient way of reducing shadows (fig 4-22). They redirect light to the subject. Reflectors bounce sunlight into areas of shadow that won't photograph well, supplying light to an area that needs more light for detail. Artificial light as well as sunlight can be reflected.

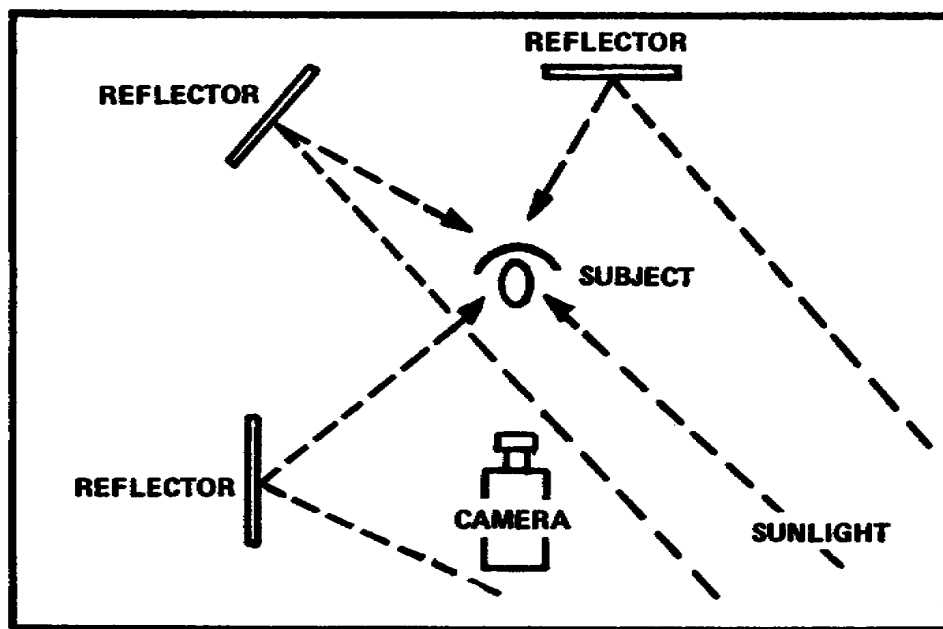

Figure 4-22. Reflector boards

a. When talent is back lit using sunlight as the keylight or dominant light, the amount of light reflected from the subject's face may be insufficient. The face is in its own shadow. In closeups, facial detail is more prominent than a long shot. To compensate for the facial shadows and define detail in the face in a closeup, use a reflector which will help balance contrast.

b. Remember, as you increase the distance from the reflector to the reflected area, any movement of the reflector is magnified. The reflector should be stable and steady. Movements due to wind or any kind of vibration

should be minimized. Mount reflector on a stand or have it secured by yourself or another person, just as you would do with a camera.

c. Monitor the position of reflectors because as the sun moves, it may make the reflector ineffectual.

3. Many varieties can be purchased. It may be easier or cheaper to make your own reflectors.

a. Use polystyrene for one side and put crumpled tin foil on the other side. The polystyrene will give you hard light reflectance and crumpled tin foil will give you soft light reflectance.

b. If you do not have polystyrene, use a piece of a cardboard or plywood for backing material. Glue smooth foil to one side and crumpled foil to the other.

c. Use white paper or possibly newspaper if you do not have tin foil.

d. Use a piece of cardboard or plywood or something similar for backing. Crumple foil and partially smooth it, then glue to backing. Smooth foils give hard light, crumpled foils produce diffused light. A crumpled foil reflector is preferred to avoid hotspots.

4. Types of reflection. One type of reflector has two sides, one with smooth silver paper and the other silver leaf. The two sides offer specular and diffuse reflection. With specular reflection (the smooth side), the rays are hard and parallel, casting sharp, well-defined shadows. Diffuse reflection (the silver leaf side) is the type seen on a cloudy, overcast day. The rays are soft, scattered and not parallel. It results in flat lighting and poorly defined shadows.

a. With a homemade reflector, the smooth foil is spectral light or harder light. The crumpled foil side produces a diffused light. The chance of hot spots is minimized with the crumpled foil.

b. When using polystyrene for one side and tin foil for the other, a variation on the foil reflector, the polystyrene will give you hard light reflectance and crumpled tin foil will give you soft light reflectance.

5. Other uses for reflectors. For a very bright spot of light, use mirrors or polished tin for distant objects or special effects. A reflector isn't usually required for a long shot, since detail is not important in faces; the person is small in comparison to overall picture.

a. Silver reflectors are used as back lights or cross lights or illuminating a dark background.

b. Polished tin or mirrors can be used for distant objects or special effects where an extremely strong light is required.

Lesson 4
Learning Event 3
PRACTICE EXERCISE

1. What problem do reflectors solve?
 - a. They form necessary hot spots
 - b. They fill in shadow areas on a subject's face
 - c. They are used in emergencies to signal the director
 - d. To replace back lights
2. A reflector is often compared to which light source?
 - a. Key light
 - b. Fill light
 - c. Back light
 - d. Side light
3. Which type of light will you get from the crumpled foil side of a reflector?
 - a. Hard
 - b. Special effect
 - c. Diffused
 - d. Not spot
4. Which of the following is true about a reflector?
 - a. Smooth foil is preferred to avoid hot spots
 - b. Use for facial detail in long shots
 - c. It is unnecessary to monitor position of reflector
 - d. Be sure the reflector is steady
5. How do you compensate for facial shadows and define detail on the face?
 - a. Use polished tin
 - b. Use silver reflectors
 - c. Use of the soft light reflectance
 - d. Use of specular reflection

Lesson 4
Learning Event 3
ANSWERS TO PRACTICE EXERCISE

1. b, they fill in shadow areas on a subject's face
2. b, fill light
3. c, diffused
4. d, be sure the reflector is steady
5. c, use of the soft light reflectance

LESSON 5
DEFINE THE POSTPRODUCTION PHASE
OF A TELEVISION FIELD PRODUCTION

TASK

Describe postproduction activities, viewing raw footage, editing, aesthetics, operator's maintenance, and preparing a postproduction package.

CONDITIONS

Given information and illustrations relating to postproduction.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of multiple-choice test covering postproduction activities.

REFERENCES

None

Learning Event 1

DEFINE EDITING AS A CREATIVE ACTIVITY, LIST THE PRINCIPLES OF EDITING

1. Editing is an art. Art implies aesthetics, i.e., is the product well made, does it possess excellence, value, and quality? A production can be assembled indifferently or ruthlessly, with no regard for quality. It would be easy to assume that editing is a matter of throwing scenes together. To the craftsman, this is the perfect way to mutilate quality camera footage. Editing requires a competent craftsman, one with an aesthetic sense. Without care, the final product is the same old thing. If the editor has pride, the production will reflect excellence.

2. Each editor has a different editorial approach. There are no set rules for editing. Editing is a creative affair requiring the editor's judgment. Editorial judgment reflects a sense of timing, personal preference, and emphasis.

a. The editor can be meticulous with his product or he can be lazy and thoughtless of the audience. The editor has it in his power to enhance or destroy quality footage that the cameraman has worked hard to produce, or a conscientious editor may be pressured to "save" mediocre footage from an incompetent cameraman. Many cameramen prefer to edit their footage to ensure a quality product.

b. Reviewing original or raw footage is not a laid-back job; it is analyzing, not just viewing. A good editor will mentally visualize 75 percent of the edits to be made, with most of the planning accomplished in one session. Before editing, review and note all footage for the following:

- (1) Video quality (good, fair, bad, unusable).
- (2) Type of shot (closeup, medium shot, long shot) and subject.
- (3) Identify shots used for cut-ins and cut-aways.
- (4) Audio quality.
- (5) Time and length of each shot.
- (6) Log all counter numbers.
- (7) Maintain quality check or control track.
- (8) Note inadequate lead-in of control track.
- (9) List all shots or scenes to be reshot.

3. Beginning the tape. Before editing any of your work, there are some signal requirements that you must be aware of. You will implement these requirements during your editing exercises.

a. Video test signal. The video level of the VTR normally is automatically controlled as it is often not possible to adjust for rapid changes in video levels manually. Typically, you record one minute of video consisting of color bars. The color bars provide you and the video engineer with a reference used to set up other video equipment during playback.

b. Audio test signal. The audio test signal recorded is a 1000 Hz tone used to set the VTR volume levels. You set the levels in the manual mode, not the automatic gain control (AGC) mode, as the AGC will cause hiss and roar as it seeks a signal during quiet portions of the program. Once you set the VTR audio levels with 1000 Hz tone, leave the controls alone. All subsequent audio level adjustments are done at the audio console.

c. After the test signal, there is a short section of "black," possibly a leader or countdown from ten to two seconds, one second of "black," then the opening of the program.

4. Editing principles are not rules, they are suggested techniques. Two fundamentals of editing are continuity and aesthetics. We must maintain audience attention by keeping their interest, by not boring them, by not confusing them. Be thoughtful of the audience while editing.

a. A rule of thumb is be aware of where the audience's attention is located on the screen before and after each edit. Good editing includes smooth transitions.

b. Continuity is fundamental. Are sequences coherent? Do shots parallel the script?

c. Avoid jump cuts. Do not edit two shots together in such a way that an obvious movement is deleted. Subject will appear to jump.

d. Avoid double action. Redundant action destroys continuity and action doesn't flow.

e. Don't change screen direction without explanation.

f. Don't cut or edit too soon. Don't lose confidence in the scene too soon. The effect may be jerky.

g. Match action.

h. Edits are often motivated by a causal relationship.

i. Edits can also be a bridge or transition.

j. Cut in on action. Cut action a fraction after the beginning of movement.

k. Avoid cutting from one shot to a shot of an irrelevant detail. You must capture the audience's attention; the production should carry itself. Audiences must not have to fight to follow the action. They should not be aware that they are being manipulated by good editing technique.

l. Use re-establishing shots any time something, someone, or somewhere new is introduced to the production.

m. Be alert to scenes that are supposed to be happening at the same time of day but were shot at different times or days.

n. Use cut-ins and cut-aways to help audiences forget former scenes.

5. Aesthetics are important. Smooth transitions are foremost; set pace and mood. Maintain quality throughout.

a. Good timing is good editing.

(1) Short cuts result in fast tempo, that is, one scene right after another, right after another.

(2) Long cuts result in slow tempo.

(3) Is scene length appropriate?

(4) Editing can compress time.

(5) Editing can lengthen time.

(6) Edit for the appropriate moment.

b. Use cut-ins and cut-aways of the same quality as overall scene.

c. When choosing from a variety of like shots, select the one with best composition, focus, color, and least distracting foreground or background.

d. Ensure that special electronic effects have a purpose and enhance the program.

e. Use appropriate change of angle. The shot should be different enough to avoid boredom but angle should not be so different as to be confusing or give a jerky effect.

f. Use sufficient close-ups. Television is a close-up medium. Closeups look better on small television screens.

g. Never cut just for the sake of it. Intercut different angles, juxtapose, begin to build up complex sequences. Establish pace and mood. Did you use a script? Do the shots parallel the script? Does audio support the video? Are the shots in order? Is there continuity?

h. Don't always edit for video. Sometimes it is necessary to edit for sound, e.g., one might edit at the end of a powerful dialogue as opposed to the middle of a conversation. However, strong video, in general is more effective than strong narrative.

6. The professional editor must first understand the process behind how the audience sees. The human mind has the capability to fill in information omitted from the basic sequence. A cut from a long shot of the cowboy on the horse, to medium shot of a closeup of his face, is psychologically acceptable to the audience. The audience requires key information.

a. The specific details must be emphasized. The general impression leaps into the specific. At the fitting moment, the editor will cut from a general view of the whole to the specific. The editor does not show every detail and movement. By cleverly editing together scenes of the basic sequence, the editor gives an impression of the real.

b. The director exercises his right to select details which he deems significant, those details which best portray his story or documentary. A 1-hour show on television may cover a 2-week period in a man's life. There is not time to show everything that happened in that 2-week period; only key events, in sequence. The mind will fill in the rest. What a tedious affair it would be if it took 2 weeks to watch a story about 2 weeks in a man's life.

7. For smooth continuity, the actions of two consecutive shots in a single scene should match. Another rule is to keep background consistent throughout.

a. In shooting a production, the cameraman changes image size. The editor uses appropriate change of angle between two consecutive shots. It must be done well or the spectator will get the impression that a subject or object has inexplicably shifted. The viewer will be aware of the change; the edit will not be smooth.

b. To cut to an insignificant detail would be irrelevant. Do not confuse your audience with meaningless detail. It is necessary to preserve screen direction if continuity is the editor's purpose.

c. If there is a new development which alters the situation, the scene usually must be re-established. At this point, the editor must edit in a long shot to re-establish the situation and retain continuity. The cuts must be smooth and continuity consistent.

d. There must be a reason for a cut. An idea may need to be carried across to another spot or the edit can mark a new subject or action. An edit can re-establish. An edit can be a transition or a bridge. Good editing means the key action or significant events are included, and inessential, superfluous movements deleted. Not every action is necessary, but there must be enough action to imply with the audience mentally filling in the unsaid, closing up time and condensing space. Good editing is dependent upon a competent editor.

Lesson 5
PRACTICE EXERCISE

1. Which of the following statements is true?
 - a. Editing is a matter of throwing scenes together
 - b. Editing is a low-level skill
 - c. Editing is a science
 - d. Editing is an art
2. Which best describes editing?
 - a. Reviewing original footage in a laid-back manner
 - b. Mentally visualizing and analyzing
 - c. Identifying unusable footage
 - d. Going by the set rules of aesthetics
3. When you are reviewing original footage, what do you look for in video quality?
 - a. Audio quality
 - b. Closeup, medium shot, long shot
 - c. Cut-ins, cut-aways
 - d. Good, fair, bad, unusable quality
4. Which of the following is true?
 - a. Identify type of shot in terms of long shot, medium shot, and closeup
 - b. Identify type of shot in terms of color or black and white
 - c. Identify type of shot in terms of transitions
 - d. Identify type of shots in terms of powerful dialogue
5. What is the purpose of color bars?
 - a. Variety
 - b. Enhance video signal
 - c. Provide video engineer with a reference
 - d. Administrative procedure
6. What tone is used to set VTR volume levels before editing?
 - a. 25 footcandles
 - b. Cardoid pattern
 - c. 1000 KHz tone
 - d. 1000 Hz tone

7. Which best describes principles of editing?
- a. Assemble raw footage
 - b. Editing principles are not rigid rules
 - c. Follow rules rigidly
 - d. Forget the audience temporarily at this point
8. What is a jump cut?
- a. Raw footage is jerky
 - b. Cutting in on action
 - c. One edit in a series of non-parallel actions
 - d. An obvious movement has been omitted
9. What is double action?
- a. Two talents moving simultaneously
 - b. Repeated actions that destroy continuity
 - c. Two similar shots back to back
 - d. Psychologically powerful action
10. What may happen if you cut from one shot to another too soon?
- a. Effect may be jerky
 - b. No causal relationship
 - c. Irrelevant detail
 - d. Compression of time

Lesson 5
ANSWERS TO PRACTICE EXERCISE

1. d, editing is an art
2. b, mentally visualizing and analyzing
3. d, good, fair, bad, unusable quality
4. a, identify type of shot in terms of long shot, medium shot, and closeup
5. c, provide video engineer with a reference
6. d, 1000 Hz tone
7. b, editing principles are not rigid rules
8. d, an obvious movement has been omitted
9. b, repeated actions that destroy continuity
10. a, effect may be jerky

BASIC TELEVISION LIGHTING TECHNIQUES

BASIC TELEVISION LIGHTING TECHNIQUES

SUBCOURSE NO. SS 0549-7
(Developmental Date: 30 June 1987)

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

Three Credit Hours

GENERAL

The Basic Television Lighting Techniques Subcourse, part of the Audio/Television Specialist, MOS 84F Skill Level 1 course, is designed to teach the knowledge necessary for performing tasks related to lighting techniques in the studio and in the field. Information is provided on several tasks which are performed at increasing levels of difficulty at Skill Levels 1 and 2. The subcourse is presented in three lessons, with each lesson corresponding to a learning objective as indicated.

Lesson 1: DEFINE BASIC TELEVISION LIGHTING TECHNIQUES IN THE STUDIO

TASK: Define studio lighting techniques for a television production, define lighting, three-point lighting, four-point lighting, and describe the lighting equipment used in television.

CONDITIONS: Given information and illustrations relating to studio lighting techniques.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to 70 percent of the multiple-choice test, covering definitions of lighting, three-point lighting, four-point lighting, equipment used and different studio lighting techniques.

(This objective supports STP tasks listed at the end of this section.)

Lesson 2: DESCRIBE MEASUREMENT OF STUDIO LIGHT WITH A LIGHT METER

TASK: Describe light meters, their function and techniques of using light meters.

CONDITIONS: Given information and illustrations relating to light meters, their function and proper technique.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to 70 percent of the multiple-choice test covering descriptions of light meters, their functions and techniques.

(This objective supports STP tasks listed at the end of this section.)

Lesson 3: DEFINE BASIC LIGHTING TECHNIQUES IN THE FIELD

TASK: Define lighting techniques in the field, define equipment used, field lighting techniques and the difference between field and studio lighting techniques.

CONDITIONS: Given information and illustrations relating to field lighting techniques.

STANDARDS: Demonstrate competency of the task skills and knowledge by responding correctly to 70 percent of the multiple-choice test covering field lighting techniques of a television production.

(This objective supports STP tasks listed at the end of this section.)

THE OBJECTIVES FOR THIS SUBCOURSE SUPPORT STP TASKS:

113-577-1044	Set Up Studio Lights for a Television Production
113-577-1045	Connect Studio Lights to Patch Board/Dimmer Control Board (Electrical Sources)
113-577-1046	Perform Measurement of Studio Light Intensity

THIS PAGE INTENTIONALLY LEFT BLANK

INTRODUCTION TO BASIC TELEVISION LIGHTING TECHNIQUES

Lighting for studio and field productions is critical. Lighting is both an art and a science. Not all rules of studio lighting apply to field lighting for a television production. Portable equipment can be used entirely for field productions. An Audio/Television Specialist requires knowledge in the techniques of lighting. The soldier should be flexible in applying techniques to the production at hand.

LESSON 1
DEFINE BASIC LIGHTING TECHNIQUES IN THE STUDIO

TASK

Define basic lighting techniques for a television production. Define lighting, 3-point lighting, 4-point lighting, and describe the lighting equipment used in television.

CONDITIONS

Given information and illustrations relating to studio lighting techniques.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 70 percent of the multiple-choice test covering definitions of lighting, 3-point lighting, 4-point lighting, and the lighting equipment used.

None

Learning Event 1:

DEFINE LIGHTING, LIGHTING PRINCIPLES, TECHNICAL AND AESTHETIC REQUIREMENTS FOR LIGHTING, 3-POINT LIGHTING, AND 4-POINT LIGHTING

1. Lighting is an art. Clever lighting manipulates the audience and their perception. This would include their perception of size, shape, color, and weight. Lighting can enhance the illusion of three dimensions. Poor lighting can result in footage without character (boring). Good lighting is critical to a quality television production.

2. Like the human eye, the television camera needs light in order to "see" and function properly. Unlike the human eye, the television camera is much more demanding as to the amount of light, the color of the light, and its relative harshness and direction.

a. Although we may see quite well with only a flashlight as an illuminating source or under extremely bright sunlight, the camera may not operate correctly under these conditions. The flashlight may not radiate enough light for the pickup tube to give off sufficient electricity. The resulting television picture lacks signal strength and consequently suffers from excess video noise, often called picture snow. Bright sunlight, on the other hand, may be too much light for the camera to handle. At best the picture looks washed out; at worst, the superabundance of light can destroy the camera pickup tube.

b. A lamp, which appears to the eye to give off a perfectly white light, may look so red to the camera that the resulting picture has a reddish tint on the color monitor (television set). Another lamp may produce light that looks to the camera quite bluish, although our eyes again perceive it as normal white light.

c. A harsh light, or a light coming from an unusual angle or direction, may produce shadows that conceal, rather than reveal, the actual shape of an object.

3. Television lighting technique is defined as the adjustment and manipulation of light to meet the technical requirements of the camera while creating a pleasing television picture. Controlling lighting for television is critical. To explain how we control lighting, we will further discuss the following areas:

a. Types of light and illumination.

b. Color temperature.

c. Technical requirements.

d. Aesthetic requirements.

4. As in all photographic arts, in television you encounter two basic types of light and illumination. The two types of light are directional and diffused. The two types of illumination are outdoor and indoor.

a. Directional light illuminates only a relatively small area with a distinct beam. It produces a well-defined shadow and produces fast falloff, which means that the light area changes rather abruptly into a dense shadow area. To achieve directional light we must use spotlights.

b. Diffused light illuminates a relatively large area with a wide indistinct beam. It produces soft, undefined shadows and causes slow falloff. The lighting instruments used to emit diffused light are called floodlights.

c. Outdoor illumination is primarily accomplished by the most reliable source we have, the sun. But, the sun does not always emit the same type of light. On a cloudless day, the sun emits a highly directional light, like a spotlight. On an overcast day, the clouds act as diffusers and change the sun into a diffused light source, like a floodlight. This light is nondirectional (diffused) and has a slow falloff. Although we use special light sources and reflectors to adjust the lighting as much as possible when outdoors, we generally have little control over outdoor illumination.

d. Indoor illumination will almost always require the use of lighting instruments. If the room is partially illuminated by available light (i.e. light coming through a window) the job of matching the amount and the two types of illumination becomes even more challenging. The amount and types of lighting instruments used varies from one handheld light to complete lighting grids that allow total and precise control over the light.

5. Color temperature is the standard presently used in television to measure the relative reddishness and bluishness of "white" light. A fluorescent bulb actually emits a blue-green tint while a candle emits a reddish tint. This difference can be measured precisely and expressed in degrees kelvin. Lord Kelvin devised this scale by heating a carbon filament, which he considered to be completely light absorbing and therefore a black body, from absolute zero to various degrees centigrade. He observed that the hotter the black body got, the more bluish the emitted light became. Conversely, the more the temperature dropped, the more reddish the light became. If he heated the filament to 3200K (3200 degrees from absolute zero centigrade) it emitted a fairly white light. Therefore, we consider 3200K the standard for "white" indoor light.

a. Outdoor illumination is bluer than indoor light and, therefore, has a different color temperature. The standard color temperature outdoors is about 5600K as measured on a midsummer day at high noon in Washington, DC.

b. Most studio lighting instruments are rated as 3200K, assuming they receive full voltage. Lighting instruments that are used to simulate or augment outdoor illumination have bulbs that are rated at 5600K. We will discuss these lighting instruments in more detail in a later section of this subcourse.

6. Technical lighting requirements are to provide enough light so that the camera can "see well" and to limit the contrast between highlight and shadow areas. In order to understand technical requirements, it is necessary to break them down into two separate areas, operating light level (base light), and contrast.

a. In order to make the camera see well, that is, so the pictures are relatively free of video noise and lag, a minimum operating light, called base light, must be established. Base light is the overall light level on a set or event area.

(1) Base light can be achieved in two distinctly different ways. The first method is to establish a highly diffused illumination through the use of floodlights. The specific areas requiring lighting (people, specific set areas, etc.) could then be added to the base lighting.

(2) The second and most preferred method is to light those areas requiring specific lighting first, then fill in the harsh shadow areas with floodlights. By using this method, very little additional light will be required to meet the base light requirements.

(3) On remote productions, where time and lighting equipment are limited, using the first method of establishing base light is the more practical of the two.

(4) The level of intensity required for proper base light varies with the type of camera used. However, if 250-foot candles are used as a standard light intensity level, practically any camera on the market today will function properly.

b. The television camera can tolerate only a limited difference between the lightest and darkest areas of a scene if it is to show the subtle brightness differences in the dark picture areas, the middle range, and the light picture areas.

(1) When working with contrast, the primary concern is the amount of light reflected by the colors and various surfaces reflecting the light, rather than the amount of light being emitted by the lighting instruments themselves. For example, a white object, such as a refrigerator, will reflect a great deal more light than a dark-blue velvet cloth, even when they are illuminated by the same light source. Further, if you should place a highly polished piece of brass on that same velvet cloth, you would probably have too much contrast without even beginning to light.

(2) The difference between the lightest and darkest parts of a picture is known as the contrast ratio. For most color television cameras, the primary contrast ratio is 30:1. This means that the lightest part of the picture area is 30 times as bright as the darkest picture area. If the contrast ratio is more than 30:1, the camera can no longer reproduce the subtle brightness differences in the lightest and darkest parts of the picture area.

(3) There are three general ways to keep the contrast ratio within television's 30:1 limits. If you follow these guidelines, you should be within the contrast limits of your equipment.

(a) Stay aware of the level of reflectance of objects. A highly reflective object needs less illumination than a light-absorbing object.

(b) Avoid high brightness contrasts in the same shot. For example, instead of placing a highly polished piece of brass on a dark-blue piece of cloth, place it on a more light-reflecting piece of cloth.

(c) Lighten the shadow areas with fill light. This will help to show some of the detail that otherwise might be lost because of too high a contrast ratio.

7. Aesthetic requirements pertain to the artistic value of a scene. To meet these requirements the following points must be considered:

a. Producing a pleasing picture by the proper distribution of light and shadows.

b. Support the illusion of reality such as moonlight, sunlight, or other similar settings.

c. Help bring out the depth and dimension of a scene.

d. Add beauty and glamour to the talent or subject.

e. Enhance the actors' looks by bringing out the good side of their features and playing down objectional ones.

8. It may seem an incredibly difficult task to light for television given all the considerations. However, if the lighting technician follows proven techniques of photographic lighting, the job becomes much easier than originally thought. Let us take a look at these techniques. Television, like all the photographic arts, is subject to photographic lighting principles. Three-point lighting is the most basic of these principles.

a. Three-point lighting, also known as triangle lighting, consists of three main light sources (as its name suggests). These three light sources are known as the key light, the back light, and the fill light (fig 1-1). These lights are positioned in such a manner to most effectively perform their function.

Figure 1-1. Three-point lighting

b. When setting up three-point lighting, the primary source of illumination is the key light (fig 1-2). Its main function is to bring out the basic shape of an object. In order to do this, the key light must produce some shadows. A spot light is generally used as the key light. This allows a great deal of directional control over the light.

Figure 1-2. Key light on person

c. When lighting is natural, the light is coming from above. Therefore, the key light is placed above and to the left or right front side of the subject being lighted. This is from the camera's point of view (fig 1-2); note the deep shadows present on the side of the face opposite the key light. When the key light is set, the object will have very dark shadows on the side opposite the key light.

d. The back light (fig 1-3) has several important functions. It helps to distinguish between the shadow area of an object or subject and the background. The back light also emphasizes the outline of the object, separating it from the background. Thirdly, the back light adds dimension and gives sparkle to a scene.

Figure 1-3. Back lighting a person

e. Generally, it is best to position the back light directly behind the object or subject being lighted (opposite the camera). However, if due to studio size constraints, the back light must be placed to one side or the other, it is best to keep it as near to the rear of the object being lighted as possible.

f. A more critical problem is controlling the angle at which the back light strikes the object. If it is positioned directly above the object, it becomes a toplight, which is undesirable. If it is placed too low, the back light may shine into the camera lens causing flare and halo. This could also damage the camera pickup tubes. In general, lighting angles of 45 degrees are considered ideal for normal lighting situations.

g. Like the key light, a spotlight is generally used as the back light. Once again, this allows a great deal of directional control over the light.

h. Once the key and back lights are set, the dimension of the object should be shown quite well. However, the falloff from light to dark areas is extremely fast. Also, the shadow area of the object is so dense that the camera is unable to see any object detail within this shadow area. Consequently, it becomes necessary to slow down the rate of falloff through the use of a fill light (fig 1-4).

Figure 1-4. Fill light

i. When placing the fill light, care should be taken not to eliminate all shadows because this eliminates the three-dimensional effect we are trying to create.

j. The ratio of key light to fill light is best, if it is about 2:1 (fig 1-5). That is, the key light is twice as bright as the fill light. This will reduce shadow density but still maintain enough shadow area to complement, rather than eliminate, the three-dimensional effect.

LIGHTING BALANCE

	Too bright	Too dim
Key light	Back light less effective. Skin tones are high. Facial modeling lost. Lightest tones tend to be overexposed. Gives a harsh effect.	Back light predominates and often becomes excessive. Darker tones are underexposed. Possible muddy effect
Back light	Excessive rim light. Shoulders and tops of heads. Excess back light causes key light to appear inadequate.	Two-dimensional picture which lacks depth. Subject and background tend to merge together.
Fill	Modeling from key light reduced and flattened.	Excessive contrast. Subject too harshly modeled.

Figure 1-5. Lighting ratio

9. Four-point lighting. Although three-point lighting yields a very good result, it is somewhat restrictive if more than one camera angle is desired. Therefore, an alternative lighting technique, known as four-point lighting, is also used. Four-point lighting uses four spotlights (fig 1-6). The illumination from these lights should strike the object being lighted at approximately a 45-degree angle from above.

a. Along with allowing greater camera angles, the four-point lighting technique is simpler to set up than three-point lighting. However, the illumination from four-point lighting is very flat (low contrast ratio).

b. The lighting ratio for four-point lighting is 1:1 for all the lights used. This means that all the lights are illuminating at the same intensity.

10. Methods of eliminating shadows.

a. Regardless of how well you light or which lighting principle you use, shadows are going to be cast on areas of the set. Usually, with careful planning and lighting adjustment, these shadows will fall in areas that the camera will not "see"; that is, areas of the set that we, as the production crew, will not use as part of the "on camera" shot. Furthermore, when lighting a set, additional background lighting must be added to illuminate the remaining parts of the scene that do not require three- or four-point lighting; i.e., the flats, props, etc. By adding this background light, the shadows cast by other lighting instruments are diluted to the point where they are no longer a problem.

Figure 1-6. 4-point lighting

b. One problem, however, cannot be so easily solved. That is the problem of shadows cast by the boom microphone. If a boom microphone is going to be used, careful coordination between the boom operator and lighting technician is required to ensure that the boom does not cast shadows on the set area that is "on camera."

11. Special lighting techniques. Many studio productions require very specialized lighting in order to set the desired mood or nature of the event. The four most common special lighting techniques are cameo lighting, limbo or silhouette lighting, colored background lighting and chroma key lighting.

a. Certain television shows, especially those of a dramatic nature, are staged in the middle of an empty studio against an unlit background. This technique, where only the performers are highlighted against a dark background, is commonly known as cameo lighting.

(1) All cameo lighting is highly directional and is achieved entirely with spotlights. In small studios, the background areas are carefully shielded with black, light-absorbing draperies from any kind of distracting spillage of light.

(2) Although cameo lighting was a highly effective technique in monochrome television, it is rather difficult to handle in color. The major problems are high contrast, dense shadows, and the low baselight levels, all adverse factors to good color lighting. However, in certain circumstances, cameo lighting can be highly effective.

b. The lighting for a silhouette effect is exactly opposite to cameo lighting. In silhouette lighting, you light the background but leave the figures in front unlighted. Silhouette lighting shows only the contour of objects and people, but no volume and texture. Obviously, you light only those scenes in silhouette that gain by emphasizing the contour of things.

(1) You can also use silhouette lighting for concealing the identity of a person appearing on camera.

(2) In silhouette lighting, you use highly diffused light (usually from scoops with scrims or soft lights) to get the background evenly illuminated.

c. Color background lighting. To change the colors of the set background, you can use various color gels to add or change the color of the background.

(1) For example, if you want a background of an even red color, you would "gel" all the background scoops with red colored gels. If you wish to break up your neutrally-colored background, you could gel a few background spotlights with the appropriate blue-colored gels.

(2) By using several sets of background lights (several instruments grouped together) with different color gels for each set, you can easily change background colors by dissolving from one set (on group dimmer 1) to another (on group dimmer 2).

(3) When lighting the background at a set, it is best if the illumination for the background comes from the same general direction as the key light. Further, the background light should be about half as bright as the key light (key to background ratio 2:1).

d. The chroma key set area consists of a colored background (normally blue) and the foreground area, such as a newscaster's desk or interview chairs and table. The blue background is used for chroma key matting. That is placing the picture from another source into the scene electronically. Wherever the color blue is within that scene, the picture would be inserted.

(1) The most important aspect of lighting the chroma key set area is even background illumination. In order to achieve an optimally effective chroma key matte, (electronically supplied background image), the blue background must be lighted with highly diffused instruments, such as soft lights or scoops with scrim attachments.

(2) If there are hot spots (undesirable concentrations of light in one spot) on the blue background or unusually dark areas, the matte looks discolored, or worse, has a tendency to break up. When lighting the foreground set, make sure there are no spotlight beams hitting the background area so that you can preserve the evenness of the chroma key background illumination.

Learning Event 2:

DEFINE AND DESCRIBE STUDIO LIGHTING EQUIPMENT

1. In order to accomplish studio lighting, we must have equipment available that is functional and easy to use. Great strides have been made over the years to improve the reliability and operational ease of lighting equipment. Studio lighting equipment is defined as the lighting instruments and accessories necessary to accomplish studio lighting.

2. Simply stated, a spotlight or "spot" is a device which focuses light in a narrow beam. Spots use a movable reflector device to make the beam narrow or wide, although its beam, even at its widest point, is still not as wide an angle as a floodlight.

a. The fresnel spot light is by far the most common and most widely used spotlight in the television studio. This type of spotlight uses a glass lens in front of the housing. The glass lens consists of concentric grooves or steps on its front surface which forms the light into a soft-edged beam as shown in Figure 1-7. Within the fresnel spotlight, the lamp and reflector position are adjusted by a crank and screw system. This allows the light beam to be made broad or narrow as desired.

Figure 1-7. The fresnel spotlight

b. The second type of spotlight we will discuss is the ellipsoidal spotlight (fig 1-8). This lighting instrument produces intense, sharply defined light beams. The ellipsoidal spotlight is used primarily for special effects lighting. For example, if you want to create "pools" of light reflecting off the studio floor, the ellipsoidal spotlight would be the instrument to use. Even when the fresnel spotlight is in its focused position, it cannot emit as sharp an outline as the ellipsoidal.

Figure 1-8. The ellipsoidal spotlight

(1) The ellipsoidal spotlight can also be used as a pattern projector. In this case, the ellipsoidal spotlight has a slot in its housing next to the beam-shaping shutters which can hold a metal pattern called a cucalorus or more simply a cookie. The ellipsoidal spotlight projects the cookie as a clear shadow pattern on any surface.

(2) The ellipsoidal spotlight is generally used for specific, precise lighting tasks, rather than for standard television lighting.

c. Another type of spotlight that is sometimes used in the studio is the follow spotlight. This type of lighting instrument is a powerful, special effects spotlight that is primarily to simulate theater or stage effects. The follow "spot" allows you to simultaneously pan (move the light left or right) and tilt (move the light up and down). The follow spot is used to follow action, such as dancers on a stage or single performers moving about in front of a stage curtain.

3. Floodlights are designed to produce a great amount of diffused light. They are primarily used to slow down the rate of falloff, reduce shadow density, and to provide base light.

a. The most common and popular type of floodlight used is known as the scoop because of its shape (fig 1-9). It is a very versatile lighting instrument that can hold colored gels, which are used to change the color of the light, or scrims, which are used to further diffuse the light and reduce its intensity.

Figure 1-9. The scoop diffused light beam

b. Another type of floodlight, which acts as a series of scoops, is known as the broad. Broads illuminate a rather large area evenly with diffused light. When using broads for fill light, it is usually possible to adjust the beam of light either through the use of barn doors or with an adjustable beam, something like the fresnel spot.

c. The last type of studio floodlight we will discuss is the strip, or "cyc" light. This type of lighting instrument is used to achieve even illumination of large set areas. The strip light consists of rows of three to twelve incandescent or quartz lamps mounted in long, boxlike reflectors. Strip lights are often used for silhouette lighting, when the background must be evenly illuminated while foreground set pieces remain unlit.

4. Even though many lighting instruments have directional controls for the light beam, it is often necessary to control the direction of the beam beyond these controls. Because of this, several other devices are used to assist you. The first of these devices that we will discuss are known as the barn doors.

a. Barn doors (fig 1-10) are extremely effective when it is necessary to block certain set areas, either partially or totally, from illumination. For example, if it is necessary to keep the upper part of some scenery dark, while illuminating the lower part of that same scenery, you could simply "barn door" the upper half of the beam. Barn doors are also important for blocking the back light from shining into the camera lens, causing lens flare.

Figure 1-10. Barn doors

b. Another type of directional control device is known as a flag. Flags are rectangular metal frames with heat-resistant cloth that act much the same as barn doors except flags are not mounted directly to the lighting instrument. Flags, like barn doors, will block illumination from spilling onto unwanted areas.

c. Yet another type of directional control device is the reflector (fig 1-11). Reflectors are usually highly reflecting sheets that bounce back a strong light source onto an object or scene to slow down falloff (make shadows more translucent). Sometimes all that is needed to reflect a light source is a white cardboard sheet. Another way of making a reflector is to crumple up some aluminum foil (creating a more diffusal reflection) and tape it onto a piece of cardboard.

Figure 1-11. Reflector

d. The final type of directional controls we will discuss is known as the scrim (fig 1-12). Scrims are spun glass diffusers that are placed in front of floodlights or external reflector spotlights to achieve maximum diffusion of the light beam. In the studio, scrims are frequently used to produce "soft" light, especially if you need to light a large area evenly, or if you want to raise the overall base light level.

Figure 1-12. Scrim

5. Now that we have discussed the equipment used to control the direction of a beam, let us take a look at how we can control the intensity or brightness of lighting. The simplest way to control the intensity of lighting is to use only the minimum number of lighting instruments needed to light the set area. However, minimizing the lighting instruments is not always enough.

a. Another technique used to control light intensity is to use scrims, not only as light diffusers, but also to reduce light intensity. There are also thin wire mesh screens that are put in front of lighting instruments, much the same as scrims, to reduce the light output (intensity) without influencing the color temperature of the light.

b. The dimmer is the most flexible of the different light intensity control devices as it allows easy manipulation of each lighting instrument, or a group of lighting instruments, to burn at a given intensity from zero (off position) to full strength.

(1) Although dimmers are technically quite complex, their basic operational principle is quite simple; by allowing more or less current to flow to the lamp, the lamp burns as a higher or lower intensity.

(2) It can be argued that dimmers are not always useful for reducing light intensity. If the current to a lamp is reduced by more than 10 percent, the color temperature of the illumination emitted from that lamp is changed along with the light intensity. You will remember, that as the color temperature of a light source is reduced, the illumination from that light source begins to emit a reddish tint. Therefore, color temperature must be considered when using the dimmer to reduce light intensity.

(3) Dimmers, however, are used as more than simple light intensity reducers and are a very important part of lighting in the television studio. Dimmers enable you to change quickly from one type of lighting to another, or to light several areas in the studio at once and activate parts or all of this lighting whenever necessary. This eliminates, or greatly reduces, setup time between different lighting situations as all are set up and checked out prior to "show time."

(4) The patch panel, or patch bay, is a device that connects lighting instruments to the dimmer control. It allows you to connect widely scattered lighting instruments to a specific dimmer, or separate dimmers, on the dimmer control board. The patch panel, like the dimmer, is very simple to operate as all the patches are numbered to coincide with the area of the lighting grid that they activate. If a few minutes are taken by the beginning lighting technician to familiarize himself with the lighting grid and patch panel, they will be able to patch a light or a group of lights with little or no assistance.

Lesson 1
PRACTICE EXERCISE

1. Which is the best definition of lighting?
 - a. Use of a key light, back light, and fill light
 - b. Combination of overall baselight level, plus key light and back light
 - c. The contrast between light and shadow
 - d. Meeting the technical requirements of the camera while creating a pleasing picture
2. Which of the following types of light will you use to light a set?
 - a. Aesthetic and standard
 - b. Directional and diffused
 - c. Illumination and shadow
 - d. Back light and key light
3. Which of the following are two types of illumination you will be working with?
 - a. Ellipsoidal and spot
 - b. Indoor and outdoor
 - c. 3200°K and 6400°K
 - d. Incident and reflected
4. Which of the following will you use as a standard for "white" light, indoors?
 - a. 3200°K
 - b. 5500°K
 - c. 3400°K
 - d. 5280°K
5. You wish to illuminate a relatively small area with a distinct beam. Which type of light will you choose?
 - a. Directional light
 - b. Fill light
 - c. Base light
 - d. Bidirectional
6. Which of the following best defines base light?
 - a. Light source which emphasizes the outline of the object
 - b. Soft, diffused light
 - c. Widely scattered lighting controlled by the dimmer board
 - d. Overall light level on a set or event area

7. Which of the following standards will you use for outdoor color temperature?
- a. 3200°K
 - b. 3400°K
 - c. 5200°K
 - d. 5600°K
8. Which best explains contrast ratio?
- a. Outdoor lighting color temperature as compared to indoor color temperature
 - b. Difference between the lightest and darkest parts of a picture
 - c. Base light ratio versus key light ratio
 - d. Difference as defined in foot candles
9. You have selected a key light and a back light for your three-point lighting. Which other light source will you use?
- a. Directional light
 - b. Fresnel light
 - c. Side light
 - d. Fill light
10. When setting up three-point lighting, what is your primary source of illumination?
- a. Fresnel light
 - b. Hard light
 - c. Directional light
 - d. Key light
11. Which of the following light sources will you utilize to separate an object from its background?
- a. Backlight
 - b. Fill light
 - c. Side light
 - d. Key light
12. Which of the following will you use as a guide for a four-point lighting ratio?
- a. 4:1
 - b. 3:1
 - c. 2:1
 - d. 1:1

13. Which spotlight will you most likely use in television studio lighting?
- a. Fresnel
 - b. Scoop
 - c. Dimmer
 - d. Ellipsoidal
14. Which floodlight is the most popular type used in the studio?
- a. Fresnel
 - b. Dimmer
 - c. Ellipsoidal
 - d. Scoop
15. Which device would you use to block certain areas, partially or totally, from unwanted illumination?
- a. Barn doors and scrims
 - b. Barn doors and flags
 - c. Battens and barn doors
 - d. Dimmers and barn doors
16. Which device will you use to bounce the illumination from a strong light source back onto an object or scene to slow down falloff?
- a. Barn door
 - b. Batten
 - c. Reflector
 - d. Scrim
17. Which of the following devices will you use to diffuse reduce light intensity?
- a. Scrim
 - b. Dimmer
 - c. Reflector
 - d. Batten
18. What is a major drawback when using a dimmer?
- a. Safety
 - b. Hard to handle
 - c. Intensity
 - d. Color temperature may be affected

19. By which percentage can you reduce the current to a lamp without affecting its color temperature?
- a. 2 percent
 - b. 5 percent
 - c. 10 percent
 - d. 20 percent
20. Which device will you use to connect widely scattered lighting instruments to a specific dimmer or separate dimmer?
- a. Patch-to-dimmer control
 - b. Dimmer control board
 - c. Patch bay
 - d. Patch control

LESSON 2
DESCRIBE MEASUREMENT OF STUDIO LIGHT WITH A LIGHT METER

TASK

Describe light meters, their functions, and techniques of using light meters.

CONDITIONS

Given information and illustrations relating to light meters, their function and the technique of using a light meter.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 70 percent of the multiple-choice test covering descriptions of light meters, their function, and techniques of using light meters.

REFERENCES

None

Learning Event 1:

DESCRIBE LIGHT METERS, THEIR FUNCTIONS, AND THE TECHNIQUES OF USING A LIGHT METER

1. In the television studio, it is necessary that we control how much light is sent to the television camera. There are various ways of controlling the light but only one accurate way of measuring its brightness. That is with a light meter (also referred to as an exposure meter).
2. The light or exposure meter measures light intensity or brightness. Light entering the meter falls upon a light-sensitive surface, usually made of selenium, which reacts to light generating a small electric current (fig 2-1).
3. The meter is actually a microammeter which measures the current produced. The microammeter causes a needle to deflect across the face of the meter scale. The brighter the light, the more current is produced, causing greater deflection of the needle. The scale that the needle deflects across is often marked in footcandles and f/stops. For television studio lighting, the footcandle scale is the most often used.
4. When using a light meter, it stands to reason that we are measuring the amount of light on a set or event area. In actuality, we may be measuring the amount of light falling on the set or the amount of light reflecting off of the set. These two methods are called incident and reflected light measurements.

Figure 2-1. The light meter

5. Incident light measurement is measuring the amount of light falling on the set area. Incident light readings are normally taken from the position of the subject or set area being lighted (fig 2-2).

Figure 2-2. Incident light reading

6. Reflected light readings measure the amount of light reflecting or bouncing off of the subject or set area and are often used to measure the contrast ratio of a scene. These readings, if taken from the camera position as shown in Figure 2-3, measure the average light reflecting back to the camera.

Figure 2-3. Reflected light reading

7. If reflected light readings are taken from specific parts of a scene (fig 2-3), they are used to measure surface brightness and tonal values, allowing accurate measurement of contrast ratios. This type of reflected light measurement is called the surface brightness method.

8. Refer to Table 2-1 for explanations of various methods used in measuring light, with the advantages and disadvantages listed for each method.

METHOD OF LIGHT MEASUREMENT		
INCIDENT LIGHT METHOD	REFLECTED LIGHT METHOD	SURFACE BRIGHTNESS METHOD
METER POSITIONED BESIDE THE SUBJECT POINTING AT LIGHT SOURCES.	METER POSITIONED BESIDE THE CAMERA, POINTING AT SUBJECT.	METER POSITIONED BESIDE THE CAMERA POINTING AT THE SUBJECT.
MEASURES LIGHT INTENSITY FALLING UPON SUBJECT FROM EACH LAMP DIRECTION IN TURN.	MEASURES AVERAGE AMOUNT OF LIGHT REFLECTED FROM SCENE AND RECEIVED AT CAMERA LENS.	MEASURES BRIGHTNESS OF SURFACE AT WHICH THE INSTRUMENT IS DIRECTED.
PROVIDING FOR (AVERAGE) SUBJECTS OF FAIRLY RESTRICTED TONAL RANGE TYPICAL INCIDENT LIGHT INTENSITIES AND BALANCE SUITABLE TO CAMERA CAN BE ASSESSED. BASE LIGHT, KEY LIGHT, FILL LIGHT, AND BACK LIGHT MEASURED IN TURN.	PROVIDING AVERAGE REFLECTED LIGHT LEVELS SUITABLE TO CAMERAS SENSITIVITY. MEASURE LIGHTEST AND (DARKEST TONES SEPARATELY AND USE MIDWAY READING FOR GUIDE EXPOSURE.)	PROVIDES READINGS BY MEASURING SURFACES KNOWN REFLECTANCE SKIN, (STANDARD WHITE AND BLACK). YOU CAN THEN DEDUCE THE SUITABILITY OF LIGHT INTENSITIES FALLING UPON THEM. ALSO ALLOWS SCENIC TONAL CONTRASTS TO BE MEASURED TO PREVENT OVER-CONTRASTY LIGHTING OVER LIT HIGH-LIGHTS UNDER LIT SHADOWS.
EASE OF OPERATION: METHOD IS SIMPLE AND CON CONSISTENT. DOES NOT REQUIRE EXPERIENCED INTERPOLATION WIDELY USED IN MOTION PICTURE LIGHTING.	EASE OF OPERATION: READINGS VARY WITH METER ANGLING AND EXPERIENCE IS NEEDED TO MAKE ALLOWANCE FOR SUBJECT TONES, AND CONTRAST. LARGE DARK AREAS CAUSE READINGS TO BE FALSELY LOW, ENCOURAGING OVEREXPOSURE OF HIGHLIGHTS. LARGE LIGHT AREAS GIVE HIGH READINGS WHICH MAY CAUSE UNDEREXPOSED SHADOWS	EASE OF OPERATION: METHOD REQUIRES SOME EXPERIENCE IN JUDGING THE IMPORTANCE OF INDIVIDUAL SURFACES BRIGHTNESS RELATIVE TO OVERALL EXPOSURE.
ADVANTAGES: WHEN A SHOW IS TO BE REPEATED ORIGINAL LEVELS CAN BE DUPLICATED READILY. BALANCE BETWEEN VARIOUS LIGHT DIRECTIONS READILY CHECKED.	ADVANTAGES: METHOD PROVIDES A QUICK ROUGH CHECK OF AVERAGE LIGHT LEVELS CAN FACILITATE EVENNESS OF LIGHTING.	ADVANTAGES: METHOD IS CAPABLE OF ASSESSING SURFACE BRIGHTNESS AND CONTRAST VERY ACCURATELY.
DISADVANTAGES: ARBITRARY ALLOWANCE HAS TO BE MADE FOR SUBJECT TONES. THE AMOUNT OF LIGHT REQUIRED DEPENDS UPON THE SUBJECT--WHICH THIS METHOD CANNOT ASSESS. METHOD ONLY DIRECTLY USEFULL FOR AVERAGE SUBJECT-TONES. DOES NOT TAKE INTO ACCOUNT TONAL VALUES PROPORTION OF TONES AND TONAL CONTRAST.	DISADVANTAGES: METER READINGS ARE ONLY OF AN AVERAGE NATURE WHICH VARIES CONSIDERABLY WITH TONAL VALUES AND PROPORTIONS. METHOD DOES NOT INDICATE CONTRAST RANGE OF SUBJECT OR LIGHTING. METER'S ANGLE-OF-VIEW SELDOM IDENTICAL WITH THE CAMERA-LENS WHERE 3 SINGLE SURFACE (E.G.A FACE) IS TO BE EQUALLY EXPOSED IN A VARIETY OF SETTINGS MEASURED EXPOSURE SHOULD BE CONSTANT BUT WILL VARY AS ADJACENT TONES CHANGE.	ADVANTAGES: SEVERAL SEPARATE READINGS ARE NECESSARY TO CHECK EVENNESS OF LIGHTING AND CONTRAST. METHOD MEASURES SCENIC TONES, BUT DOES NOT DISTINGUISH THEIR RELATIVE IMPORTANCE: AND HENCE THE DESIRED EXPOSURE. TONAL CONTRAST MEASUREMENTS MAY NOT SIGNIFY: IF THE TONES MEASURED DO NOT APPEAR TOGETHER IN PICTURE. IF THEIR PROPORTIONS ARE SMALL AND UNIMPORTANT. IF THEY MAY BE ACCEPTABLY CRUSHED OUT WITHOUT INJURING PICTORIAL QUALITY.
NOTE: WHERE METER IS HELD CLOSE TO SUBJECT, MEASURING INDIVIDUAL SURFACE BRIGHTNESS, METHOD BECOMES AS FOR SURFACE BRIGHTNESS METHOD.		

Table 2-1. Methods of light measurement

Learning Event 2:

DESCRIBE THE TECHNIQUE OF USING LIGHT METERS

1. As discussed in Lesson 1, it is necessary for us to measure both lighting ratios and contrast ratios.
2. Lighting ratios are realized by measuring the difference in light intensity being emitted by different lighting instruments. Lighting ratios are measured by using incident light readings. For example: to measure the lighting ratio between the key light and the fill light, when setting up three-point lighting, turn on just the key light and measure its light intensity. Then turn off the key light and turn on just the fill light. Now measure the fill light's intensity. If the key light intensity is 100 footcandles and the fill light's intensity is 50 footcandles, then the lighting

ratio between key light and fill light is 100:50 or more simply 2:1. This same procedure could be used to measure the lighting ratio for all lighting instruments in the studio.

3. Contrast ratios, on the other hand, are measured quite differently. When measuring contrast ratios, the important factor is the amount of light reflecting off the screen, rather than the amount of light falling on it. The surface brightness method of light measurement is used to measure contrast ratios. To measure contrast ratio, it is necessary to measure the scene in the different brightness areas (fig 2-3). If the lightest area of the scene reflects 200 footcandles and the darkest area of the scene reflects 20 footcandles, we have a contrast ratio of 200:20 or 10:1, well within the 30:1 contrast limits of today's color television cameras.

4. There are many different makes and models of light meters with varied options and functions. When working with your light meter for the first time, read the operating instructions and familiarize yourself with the light meter prior to taking important light readings.

5. Once familiar with your light meter, a little practice using the different methods of light measurement should enable you to measure the light levels on your set precisely and accurately.

6. The beginning lighting technician often becomes a slave to lighting measurements and ratios. Usually, a quick check of baselight levels is all that is needed for most lighting situations. In especially critical situations, it may be necessary to check reflectance of faces or bright objects. Some lighting technicians get so involved in reading the light meter that they forget to look into the monitor to see if the lighting looks the way it was intended. If you, as the lighting technician, use your knowledge of how the camera works and combine that knowledge with artistic sensitivity and especially common sense, you will not have the light meter tell you how to light; rather, you will use it as a guide to make your job more efficient.

Lesson 2
PRACTICE EXERCISE

1. You are measuring light intensity. Which of the following would you choose for accuracy?
 - a. Metric light gauge
 - b. The trained eye
 - c. Selenium calibrator
 - d. Light meter
2. Which two methods will you employ to measure light intensity?
 - a. Technical and aesthetic
 - b. Incident and reflected
 - c. Concentrated and diffused
 - d. Minimum and maximum
3. Which method of light measurement would you use to measure light falling on the set?
 - a. Aesthetic
 - b. Baselight
 - c. Incident
 - d. Technical
4. How do you measure contrast ratio?
 - a. On a waveform monitor
 - b. Using an f/stop
 - c. By measuring ASA
 - d. By measuring surface brightness
5. You are measuring light intensity emitted by different light instruments. Which ratio will you use?
 - a. Brightness ratio
 - b. Lighting ratio
 - c. Contrast ratio
 - d. Reflectance ratio
6. You are measuring the different brightness areas of your scene. Which ratio are you measuring?
 - a. Brightness ratio
 - b. Intensity ratio
 - c. Contrast ratio
 - d. Reflectance ratio

7. Which of the following is a standard contrast ratio for a color television?
- a. 60:1
 - b. 50:1
 - c. 40:1
 - d. 30:1
8. Which method of light reading would you use to measure the amount of light emitted from the object to the camera?
- a. Diffused
 - b. Optical
 - c. Reflected
 - d. Principal
9. Which method of light measurement would you use to measure the difference in light intensity between the key light and the fill light?
- a. Principal
 - b. Incident
 - c. Optical
 - d. Incandescent
10. The brightest area of your set reflects 200 footcandles whereas the darkest area reflects 20 footcandles. How would you best describe your contrast ratio?
- a. 20:20
 - b. 30:1
 - c. 20:1
 - d. 10:1

LESSON 3
DEFINE BASIC LIGHTING TECHNIQUES IN THE FIELD

TASK

Define lighting techniques in the field, describe the equipment used, and the differences between field and studio lighting.

CONDITIONS

Given information and illustrations relating to field lighting techniques.

STANDARDS

Demonstrate competency of the task skills and knowledge by correctly responding to 70 percent of the multiple-choice test covering field lighting techniques of a television production.

REFERENCES

None

Learning Event 1:

DEFINE LIGHTING TECHNIQUES IN THE FIELD AND DESCRIBE THE EQUIPMENT USED

1. When engaged in field or "remote" productions, you will not be working in the studio where all lighting equipment is in place and ready to go. Every piece of equipment; however large or small, must be hauled to the remote location and set up in places that always seem too small or too large for good television lighting. Also, there never seems to be enough time to experiment with various lighting setups in order to find the most effective one. Because of these factors, a lot of planning is necessary to complete a remote lighting task with the minimum amount of time and equipment.

a. Remote productions can vary from a simple interview in someone's office to highly complex scenes shot "on location." Regardless of how simple or complex the remote production is, you will soon find out that time is at a premium. Therefore, you must plan your lighting task within time and equipment constraints, be prepared to compromise, and strive for the best lighting possible, relative to the other production requirements.

b. When lighting for remote productions, you will find yourself confronted with both indoor and outdoor lighting requirements. Frequently, you will be using available light; that is, the illumination already present at the remote site. But there are many occasions when you must supplement the available light or provide the entire lighting for the production.

2. When shooting outdoors, the primary source of illumination is the sun. Even though we have no direct control over the sun, there are ways to make it work to our advantage. The sun's illumination can also be supplemented by using special lighting instruments and accessories.

3. The ideal light for shooting outdoors is an overcast day. The clouds act as diffusers for the hard, directional sunlight, providing an even illumination. Because the diffused light of an overcast day creates rather soft shadows and therefore slow falloff, shadows are not usually a problem. However, try not to position a person in front of a white or otherwise bright background. The auto-iris of the camera will read and adjust to the bright background rather than the person. Consequently, the person will be underexposed and appear as a silhouette in front of the properly exposed background.

4. Most outdoor lighting problems occur on bright, sunny days. During this type of day, the sunlight is highly directional and produces dense shadows (fast falloff). Here are some helpful hints of how to "shoot" in bright sunlight.

a. Whenever possible, shoot with the sun, not into it. That is, the sun should be in the camera operator's rear. If you shoot against the sun (backlit), the auto-iris in the camera lens will expose about two stops under the proper exposure causing the subject to be underexposed. If you must shoot your subject backlit, try to get as close a shot as possible and use a reflector to bounce as much light on your subject as possible (fig 3-1).

Figure 3-1. Shooting backlit

b. In bright sunlight, the problem of bright backgrounds is more severe than in the diffused light of an overcast day. Again, try to avoid shooting against a bright, sunlit background. Even if the camera is on manual iris control and is adjusted for this foreground figure, the bright background will

often push the contrast ratio beyond the 30:1 limit. This extreme contrast would cause background overexposure. If you cannot avoid the bright background, you may have to shoot the scene anyway. If this is the case, be sure your subject is exposed properly, by using the manual iris control on the camera, and allow the background to overexpose.

c. The dense shadows (fast falloff) on bright days can be lessened (slow down the rate of falloff) somewhat by using a reflector. The reflector bounces back some of the sunlight and renders the dense shadows more translucent (fig 3-2).

Figure 3-2. Use of reflector to lighten shadows

5. When shooting in inadequate outdoor illumination, try to keep the camera as steady as possible in order to minimize lag and comet-tailing. It is also important to note that when you are shooting under low light conditions, the camera iris must be opened much wider than when shooting under adequate lighting. This will shrink the depth of field, making the focus much more critical than when shooting in bright sunlight. This is because the amount the iris is open directly affects depth of field. When the iris on the camera is set to a wide opening, the depth of field is shallow, meaning that some parts of the scene will be in focus while others will not. In good lighting conditions, the iris will be set to a smaller opening, which increases the depth of field. If this knowledge is combined with the fact that the focal length of the camera lens also affects depth of field, (the longer the lens focal length the more shallow the depth of field will be); you should be able to shoot under low light conditions and still keep the important parts of the scene in acceptable focus.

Learning Event 2:

DESCRIBE THE DIFFERENCE BETWEEN FIELD AND STUDIO LIGHTING TECHNIQUES

1. Shooting outdoors may require the use of lighting instruments in addition to reflector. However, you will recall that most lighting instruments illuminate a color temperature of 3200 degrees kelvin. But outdoor illumination has

a color temperature of 5600 degrees kelvin. Television cameras can be adjusted to operate under either of these color temperatures but not both at the same time. Therefore, when using lighting instruments outdoors to supplement available sunlight, the color temperature of the available light and the lighting instruments used to supplement that light must be matched. Since we can't change the color temperature of the sun, we must match the color temperature of the lighting instruments to the sun.

a. The easiest method of changing a lighting instrument's color temperature is by attaching a dichroic daylight filter to the front of the lighting instrument. A daylight dichroic filter will change the color temperature of the illumination emitted by the lighting instrument to 5600 degrees kelvin, matching the color temperature of outdoor illumination. A blue gel can be used as a substitute for a dichroic daylight filter, but care must be taken to ensure that the gel does not change the illumination beyond 5600K. Otherwise, the scene will take on a bluish tint.

b. When shooting indoors, matching color temperatures of different light sources can be even more difficult than when shooting outdoors. Some interiors are illuminated by the daylight that comes through large windows, others with fluorescent lighting, and still others use desk and floor lamps to augment the daylight that is coming through windows. The major problem here is not so much how to supply additional light but how to match the various color temperatures.

2. The most difficult problem is having to shoot your subject with a large window in the background. Often a general wants to make his or her brief statement from behind a desk, and the desk may be located in front of a large viewing window. There are two lighting problems in this situation. First of all, there is a problem identical to that of a person in front of a bright background. If you set the iris according to the background brightness, the general in front tends to turn into a silhouette. If you adjust the iris to the general, the background is overexposed. Secondly, the color of the light coming through the window does not match the illumination used to light the room. If you adjust the camera to the daylight color temperature, the illumination will appear bluish. Let us take a look at some possible solutions to these problems.

a. The best method of controlling both of these problems is to draw the curtains or blinds and light the set using portable lighting instruments. Unfortunately, not all office windows have curtains or blinds. Another easy method of controlling these problems is to "shoot" your subject using only closeups, thus eliminating most of the background. The "closeup only" method is not always practical either. For instance, some people just do not look good when shown close up.

b. If you must shoot the scene with the window in the background, it is possible to cover the windows with large plastic neutral density and color correction filter sheets. Neutral density (ND) filters act like sun glasses, reducing the intensity of the light without changing color temperature. Color correction filters, on the other hand, change the color temperature of the light. A combination neutral density and color correction filter sheet can be

used to change light intensity and color temperature. Even though they are very effective, these filter sheets are not used very often primarily because of the cost associated with them, or the time that is required to put them in place.

c. Another possible method of handling this situation is to shoot your subject with the window to his side, rather than to his rear and use a reflector or a portable lighting instrument with a daylight dichroic filter attached to it as an additional light source (fig 3-3). By using this method, the daylight coming through the window is used as the key light and the additional light source or reflector is the fill light. As you can see, this allows the daylight coming through the window to be used as part of the set lighting, rather than a hindrance to it.

Figure 3-3. Using daylight from a window as the key light

3. The problem of working under fluorescent lights is their color temperature. It is always higher than the standard of incandescent lights (3200K). So, if you use additional lighting instruments, you are once again confronted with two color temperatures. Some lighting people advise turning the fluorescent lights off altogether when using quartz lights (3200K), but this is not always practical. If you are shooting a fast-breaking story, you just won't have time, first, to locate the building manager and persuade him to turn off the lights, then relight the scene before you start shooting.

a. If you have to use a quartz light for additional illumination, either boost the color temperature of the quartz light (using a dichroic filter) or adjust the camera using the illumination provided by the quartz light (3200K). Generally, a quartz light, such as a sun gun, is strong enough to "wash out" the bluish tint emitted by the fluorescent base light. Even if you could turn off the fluorescent lights, you might want to leave them on to

have enough base light. A higher base light allows you to work with smaller lens iris openings which increases depth of field, making it easier to focus.

b. When lighting large groups of people, such as commanders' calls or chaplains' briefings, the easiest and most efficient method to light is by establishing a general, nondirectional base light. Simply use two or three portable lights and bounce the illumination emitted by them off the ceiling or walls. If this is not possible, direct the light on the group but diffuse the light with scrims. The most efficient method is to use two or three small, high intensity lights, such as tota-lights and diffuse their beam with umbrellas (fig 3-4).

Figure 3-4. Lighting a large group

4. When time and equipment are available, the same basic lighting principles are used in field lighting as are used in the studio. If you refer to Figure 3-5, you see three-point lighting set up the same way it would be set up in the studio. In this situation, however, the portable lights are of a type that can be placed in either the spot or flood position. This lighting also shows the use of a background light.

a. It is worth noting that the background light is positioned on the same side of the subject as the key light. This is because the lighting should appear to be coming from the same direction, as if the scene were being illuminated by the sun. You will remember that in three-point lighting, the key light is the primary light source; therefore, in order to maintain directional continuity in our lighting, it stands to reason that any background lighting should come from the same direction as the key light.

b. Figure 3-5 also shows an alternative to using three lights to accomplish three-point lighting. If, because of electrical power restrictions or lack of enough lighting instruments, you cannot use three instruments, a reflector can be used in place of the fill light. The reflector will bounce enough light back on our subject to adequately fill in the shadow areas cast by the key light.

Figure 3-5. Three-point lighting in the field

5. There are many times when three- or four-point lighting is just not practical to use. A two-person interview is certainly one of those times. When lighting for this type of production, whether in the studio or on remote, it just is not practical to set up three-point lighting for each subject. Lighting this scene, using the three-point lighting setup would take six lighting instruments and a great deal of electrical power. Even if the lighting instruments and the electrical power are available, the intensity of the light from so many instruments would be extremely high causing "hot spots" on your subject.

a. A good alternative to using three-point lighting is shown in Figure 3-6. Here, the key light for the interviewer is also the backlight for the guest and the key light for the guest becomes the back light for the interviewer. This eliminates two lighting instruments while still meeting the key/back photographic principle.

b. Figure 3-6 further shows camera lights being used as the fill lights, although reflectors could be used to perform this function, further reducing the lighting instruments used.

Figure 3-6. Lighting for a two-person interview

Lesson 3
PRACTICE EXERCISE

1. You are shooting outdoors, what is your primary source of illumination?
 - a. Sunbelt
 - b. Sun gun
 - c. Sun
 - d. Reflector
2. Which of the following would be the ideal situation for shooting outdoors?
 - a. An overcast day
 - b. Bright sunlight
 - c. Directional sunlight
 - d. Fast falloff
3. Your lighting situation is an overcast day with soft shadows. Which of the following best describes your falloff?
 - a. Fast falloff
 - b. Slow falloff
 - c. Medium falloff
 - d. No falloff
4. Whenever possible, what should be the position of the sun in relation to the cameraman?
 - a. Sun should be in rear
 - b. Sun should be directly overhead
 - c. Sun should be in front
 - d. Whichever the cameraman prefers
5. What will be the position of your auto-iris if you are shooting backlit?
 - a. One stop under the proper exposure
 - b. Two stops under the exposure
 - c. Three stops under the exposure
 - d. Four stops under the exposure
6. You are shooting outdoors in bright sunlight. What is the best way to lighten shadows by slowing down the rate of falloff?
 - a. Use a scoop
 - b. Use a cucalorus
 - c. Use a flag
 - d. Use a reflector

7. What is your depth of field if your camera iris is set to a wide opening?
 - a. Inverted
 - b. Long
 - c. Shallow
 - d. Great
8. Which type of filter should you attach to your lighting instrument to change your color temperature?
 - a. Neutral density
 - b. Diffusion filter
 - c. Dichroic daylight
 - d. Starburst
9. Your focal length also affects depth of field. Which of the following is a true statement?
 - a. The longer the focal length, the greater depth of field
 - b. The longer the focal length, the more shallow depth of field
 - c. The longer the focal length, the more intense the depth of field
 - d. The longer the focal length, the depth of field is inverted
10. Your subject is seated at a desk in front of a window and you adjust the camera to indoor illumination. What color will the illumination appear that is coming through the window?
 - a. Bluish
 - b. Reddish
 - c. Greenish
 - d. Brownish
11. Which filter should you use to reduce light intensity without affecting color temperature?
 - a. Diffusion
 - b. Dichroic daylight
 - c. Neutral density
 - d. Starburst
12. What is the color temperature rating of your quartz light?
 - a. 5600°K
 - b. 4800°K
 - c. 3400°K
 - d. 3200°K

13. You are positioning your background light. Where should it be positioned in relation to the key light?
- a. On the same side as the key light
 - b. Opposite from the key light
 - c. Above the subject and the key light
 - d. Below the subject and the key light
14. What is your primary light source in three-point lighting?
- a. Base light
 - b. Fill light
 - c. Key light
 - d. Back light
15. You are using three-point lighting for an on-site production. There are two lighting instruments available. What is the best alternative?
- a. Delay production
 - b. Use a reflector as a key light
 - c. Use a reflector as a fill light
 - d. Adjust for indoor illumination

FILMING CONTROLLED ACTION

SUBCOURSE NO. SS0550-8
(Developmental Date: 30 September 1988)

US Army Signal Center and Fort Gordon
Fort Gordon, Georgia

EDITION 8
CREDIT HOURS: 2
NEW: 1988

This subcourse is designed to enhance your knowledge and performance of tasks relating to filming controlled action. Information in this subcourse is also available in the resident motion picture course taught in Advanced Individual Training (AIT) for MOS 84C. This subcourse is intended to provide transition and merger training for soldiers holding MOS 84F (Audio Television Production Specialist). The course is presented in two lessons, each lesson corresponding to a terminal objective listed below.

Lesson 1: PREPARATION FOR FILMING CONTROLLED ACTION

TASK:

Prepare outline and equipment for filming controlled action.

CONDITIONS:

Given information and diagrams relating to preparation for filming controlled action.

STANDARDS:

Demonstrate competency of the task skill and knowledge by correctly responding to 80 percent of the multiple-choice test questions concerning preparation for filming controlled action.

Lesson 2: FILMING TECHNIQUES

TASK:

Filming controlled action.

CONDITIONS:

Given information and diagrams relating to filming controlled action.

STANDARDS:

Demonstrate competency of the task skill and knowledge by correctly responding to 80 percent of the multiple-choice test questions covering filming techniques for controlled action photography.

These objectives are supported by these tasks:

113-577-1064	Prepare a Scene Breakdown Sheet for Controlled Action Photography
113-577-4035	Operate Camera Set Motion Picture B&H 70 HR
113-577-4040	Perform Motion Picture Filming Techniques for Television
113-577-4048	Operate Camera Set 16mm Motion Picture Arriflex 16S for a Production

INTRODUCTION TO FILMING CONTROLLED ACTION

These two lessons on filming controlled action are designed to teach you the methods of filming controlled action within your unit. The techniques are based on the use of a motion picture camera, however, these lessons are equally adaptable to television camera usages. The television camera operators can and should use these same techniques. Increasingly, Army visual information units are becoming more tactically oriented and will require efficient motion picture filming and television documentation. Most of this filming will be performed in the field. Your ability to support the Army with useable motion picture footage or television documentation may spell the difference between mission failure and mission accomplishment.

***** IMPORTANT NOTICE *****

THE PASSING SCORE FOR ALL ACCP MATERIAL IS NOW 70%.

PLEASE DISREGARD ALL REFERENCES TO THE 75% REQUIREMENT.

LESSON 1
PREPARATION FOR FILMING CONTROLLED ACTION

TASK

Prepare outline and equipment for filming controlled action.

CONDITIONS

Given information and diagrams related to preparation of filming controlled action.

STANDARDS

Demonstrate competency of the task skill and knowledge by correctly responding to 80 percent of the multiple-choice test concerning preparation for filming controlled action.

FM 11-82

INTRODUCTION

Controlled action cinematography is simply using the skills and techniques acquired through school or on-the-job training, and applying them in a situation where you control the entire aspect of the production: music, sound effects, special effects, dialogue, action, and targeted length of the project. You probably will not be filming a major production, but you will still need careful planning and preparation to make your production effective and informative. Training productions do not have to be dry, dull and boring. It is your job as the cameraman/director to make sure that the images on the screen, whether 16mm, 35mm or videotape, are clear, well composed and framed, and shot from a variety of angles to add interest and help the flow of continuity. And you may do as many retakes of a scene as needed to get it right.

The term "visual information" has replaced "audiovisual" in the Army of Excellence.

Learning Event 1:
PREPARE TO FILM CONTROLLED ACTION

1. As the name implies, in controlled action photography, while working from a carefully developed script, you control all aspects of the production, including the actors and their actions. If the actors have lines to speak, the dialogue is in the script; if the action is described by a narrator, the narrator's lines are in the script. Examples of controlled action film include training films, portions of documentaries or historical records, and many publicity and recruiting films.

2. Essentially a motion picture is another medium for telling a story. One can compare the camera to a typewriter. Each is a simple tool by which the cinematographer or author expresses himself. Many people consider motion pictures to be merely a form of photographic medium, but it is a narrative one also.

a. Basic photographic techniques include the technique of storytelling. To ensure that every film story has the required elements of story construction; central theme, introduction, buildup, climax, and ending, it is advisable that an outline be prepared.

b. Scripts, as outlines are called, vary considerably in content and degree of detail. The script is the blueprint of the production and to make your job easier, as well as ensure a smooth production, it should be carefully and thoroughly prepared.

c. Depending on the size of the production company, there may be from 5 to 25 people on the set, not including actors. The military crews usually have from four to eight. On a small production set the camera crew may consist only of a director and a camera operator.

3. Types of military productions suitable for controlled action filming may be shot on film or video tape and may be of any length, from three minutes to one hour. Training films are usually developed to assist soldiers to improve performance of critical tasks such as:

- a. Weapons maintenance
- b. Electronic/mechanical repair
- c. Safety
- d. Battlefield orientation
- e. New equipment operation
- f. Common tasks for all soldiers

4. Joint Optical Information Network (JOIN). The U.S. Army Recruiting Command uses controlled action film scripts to show candidates the type of work each military occupational specialty (MOS) offers in training and duty opportunities. These productions are normally 3 to 6 minutes in length.

5. The rules of controlled action filming are that there are no rules or limits to what can be created through your own imagination and efforts. However, no matter how brilliant your ideas may be, you will always need a plan from which to build your production.

Learning Event 2: PLAN A PRODUCTION

1. Categories of style. Generally, there are two styles of filming; fantasy and fact.

a. Fantasy is the product of imagination, and in book form it would be called fiction.

b. Factual film depicts events or activities that did, or do, take place.

(1) Films can be instructional, training or showing "how-to-do-it". They can also be documentaries - factual stories on people, places or things.

(2) A second type of factual style would be historical films, which are renderings or reconstructions of certain eras or events.

2. Preplanning your production. As with most endeavors, filming controlled action is only as good as the planning that goes into the effort. A great deal of time and money can be wasted if a person tries to complete a task without first planning how he or she will accomplish it. Generally, the more planning that is done before starting a task, the faster and more efficient will be the final outcome.

a. Preplanning must include such things as: researching the subject, writing a shooting outline, notifying team members, assembling equipment, coordinating with other agencies that may be involved with the mission, contacting the public affairs office if necessary, and ordering transportation.

b. As part of your preplanning you will want to find out if there are any special or abnormal situations that may cause problems with filming or taping. Also, it is important to keep in mind that climatic extremes can pose technical problems for the operator and his equipment. You may be stationed at a post where the temperature is 70 degrees and the sun is shining, but where you are going the temperature is 10 degrees and snow is falling. It is up to you to ensure that you and your equipment are prepared for any climatic extremes at the area you will be working in.

3. Research your material.

a. Once you are informed of the mission you can start your research. First of all, familiarize yourself with the subject matter. You may want to go to the library, look up the subject, find out what it is, where it is at, how it is played, how it works, how it is done, or how to operate it. The more you know about the subject, the more insight you will have in your filming. It would be difficult for you to film "Field Strip an M-16," if you did not know what an M-16 looked like. It is the same with any assignment; an effective cameraman understands the subject. Research makes the difference between a good product and a poor one.

(1) There are many sources for material on any given subject. If it is a military subject, you may be able to obtain the information you need in unit publication files, technical orders, or regulations. You may have a unit on your base or post that does essentially the same job as your subject and you may be able to get the basic facts about the job there.

(2) Do not forget about the post library; it is an invaluable source of facts and information.

b. After all of the necessary data has been assembled, it is time to write a shooting outline. The outline is not a script one might use in a production. It is a plan of what scenes you want to use to document a complete story. The shooting outline is one of the first steps to take in preparing to film a story.

c. Secondly, you will want to go to the various locations where you intend to film, and locate the best shooting positions. Some things to check are: location of the sun (try to keep it behind you); if indoors, is power available for lights or will equipment such as portable sun guns be necessary; what areas would be best for filming, and what angles will be best.

Learning Event 3: WRITE A SCRIPT OUTLINE FOR CONTROLLED ACTION

1. Before you can shoot a controlled action scenario, you must have a plan. The first part of planning is gathering the data necessary, then decide what script format will be used, A or B.

a. The class A script, also called the Hollywood format, is a one-column script used only when new or original footage is required. Scene description (visual) comes first and runs the full width of the page, margin to margin. The narration or dialogue (audio) follows and is indented well back from each margin. An example of a Hollywood "A" script follows:

INT. DAY. THE OFFICE OF THE FIRST SERGEANT, WHO IS SEATED AT HIS
DESK, WRITING A REPORT. THERE IS A KNOCK ON THE DOOR.

FIRST SERGEANT

Come income in.

THE DOOR OPENS AND PFC WINTERS ENTERS, DRESSED IN HIS BDU CLOTHES, WALKS TO THE DESK AND ASSUMES A PARADE REST STANCE.

PFC Joseph Winters, reporting as ordered, First Sergeant.

FIRST SERGEANT

At ease, PFC Winters. Have a seat.

PFC WINTERS NODS, AND SITS IN THE DESIGNATED CHAIR BY THE DESK.

WINTERS

Thank you, First Sergeant.

FIRST SERGEANT

(Picks up the paper he's writing)

Relax. You're my 25P. I've got a little job for you to do.

WINTERS

(obviously less tense, now)

Great, sir...I mean, First Sergeant...Film or video?

FIRST SERGEANT

Film. The colonel needs some new opening footage shot for the "Welcome to Fort Halliday" visitor's briefing.

THE FIRST SERGEANT RISES AND WALKS TO THE WINDOW. HE BECKONS PFC WINTERS TO FOLLOW HIM. THEN HE POINTS OUTSIDE.

FIRST SERGEANT

Somewhere over there on the parade ground. The first camera man's work was too flat and dark. Try to pick a good vantage point, and with people going in and coming out of the main door. Got it?

WINTERS

Yes, sir...I mean, First Sergeant. I've been waiting for a chance to put my school training to work.

FIRST SERGEANT

When did you sign in?

WINTERS

Yesterday.

NOTE: Scenes with actors and dialogue are usually shot with a MASTER shot, continuous action from one camera vantage point; then on subsequent shots, close-ups of each actor are filmed that may be edited in later. It is extremely important that each actor duplicates his previous movements for each "take", For example, if a master shot showed an actor holding a half filled glass of water on a certain line, you must ensure the same the same amount of water is in the glass on the same line when you shoot him or her for reverse angles or medium close-ups which show the glass. And make sure the same hand holds the glass as in the previously filmed shot, and at the same height or location. For the sake of continuity, polaroid camera shots are usually taken at each new scene setup to check on clothing, ties, props used, and hair styles, etc. It is not unusual to film a sequence over that may have been shot originally a few days or even weeks in the past.

b. The class B script is in a two-column format and is used when most or all of the film will be made up from stock footage. The division is vertical with scene description on the left and narration on the right. With certain "nuts-and-bolts" films, the class B format is used even though original shooting is required. Let's follow the storyline established in the A script format, with an example of the Hollywood B script format:

SCENARIO

AUDIO

EXT.DAY

Pick up PFC Winters as he comes out of the headquarters building, carrying a camera case and tripod. As he comes to front walk he hesitates, then turns to his right. (Do not PAN). Let actor make a clean exit out of the frame.

Winters: (Thinking aloud) SOME ASSIGNMENT.

SHOOT A STUPID SHOT OF

THE FRONT OF A BUILDING.

Head-on shot of Winters
as he walks a few steps,
then stops and looks to his
left. Hold until he smiles.

POV Winters. Shoot from
Winter's position a view of
the parade ground. Slowly PAN
left, then back to the right.
Stop at the Statue.

(Change Angle) Pick up Winters
crossing the street and follow
him as he heads towards the
statue.

(Change angle) Winters stops and
puts camera down and begins to
set up the tripod. Hold until he
leans over to pull down a tripod
leg.

(Change Angle) Start shot on the
boot area and hold until he sets
the tripod leg tip on the ground.

(Change Angle) Pick up Winters
extending all of the tripod legs
to the proper height.

Start shot as the platform head
of the platform is raised to
the level of Winter's nose. Hold
until Winters places a hand on
top of platform, then leans down.

Pick up hand as Winters adjusts
the knob on the tripod legs.

(Change angle) Winters stands up,
puts the tripod in place and
pushes on it from the top, with
both hands to check its stability.

WELL, NO ONE PROMISED
EVERY FILM ASSIGNMENT
WOULD BE "RAMBO III."

MAY AS WELL LOOK AT THE
OLE "H.Q" FROM GENERAL
HALLIDAY'S PERSPECTIVE.
NOT BAD. GOOD STARTING
POINT.

SUN'S NOT TOO BRIGHT.
DON'T THINK I'LL
NEED FILTERS.

GLAD I PRE-OPPED THIS
THING. IT NEEDED A
LITTLE LUBE JOB.

WHAT WAS IT INSTRUCTOR
BROWN SAID--SET THE
TRIPOD UP TO CHIN OR
NOSE...YEAH.....
AND ALWAYS TIGHTEN THE
LEGS.

OK. C'MON, ARRIFLEX
16S, LET'S GET TO WORK

Then he reaches for the camera case.

"SARGE" WANTS AN

ACADEMY AWARD WINNING

SHOT FOR THE COLONEL'S

BRIEFING.

NOTE: When using A or B script formats, the left margin information may be typed in or handwritten by the director. The choice of camera shots, long shot (LS), medium shot (MS), close-up (CU), and point of view (POV), and scene numbers, are usually written in by the director after he reads the script for the daily shoot.

c. Production scripts are basically a breakdown from the master script, or a shooting script. In order of presentation, the shooting script contains; the title, project number, requesting agency, project office, technical advisor, running time, and scene breakdown. The shooting script also shows the camera position (LS, MS, CU, ETC.); day, and a brief description of the action. A special script is simply a "retake" of some shot areas to pick up cut-ins or cutaways, or other transition-type shots to be edited into the film at some future time.

2. Sources of film material. There are a number of sources of film material. It can be original shooting, animation (the same as used for cartoons), or stock footage. Stock footage is the same way books are kept in a library. Each U.S. Armed Service maintains a film depository. The Army depository is at Tobyhanna Army Depot, PA. Historical film shot by all of the services is stored at the National Archives in Washington D.C.

3. Prepare equipment. After the outline is written, you must get your equipment together.

a. By analyzing your outline you may realize that you will need more than one camera and cameraman. This is the time to go to your NCOIC and present your outline. The NCOIC may modify it to use less equipment or personnel, but a good outline will justify itself in terms of manpower and equipment requirements.

b. In addition to camera equipment, you will need film or tape, batteries, and an extra microphone and cable.

c. No matter which position you either assign or fill yourself, the correct camera, film, and equipment must be selected.

(1) For instance, if you will be shooting from a stationary position with a tripod-mounted camera, you will need large magazines or several 3/4-inch tapes. If hand-held, you usually film 16mm or portable 3/4-inch video. So you would need to carry at least one spare film pack or two extra video tapes.

(2) Are sufficient spare parts and extra expendables available for the mission? Extra batteries are always first on a list of spare parts, followed by extra film reels and cables, spare light bulbs for lamps, extension cords, and filters. Something as simple as a broken take-up reel could completely stop a filming session. The last thing you want to happen is to run out of film, tape, or to have the batteries die. Select your equipment, test it, and make sure your film is of the right ISO and matches that of the other cameramen. A good cameraman has everything necessary to perform the mission well and to keep it going in case of equipment failure.

4. Duties of a camera crew

In order to properly film a scripted movie it is necessary to have a closely knit, well functioning crew. One person cannot possibly carry out all the jobs that must be done, unless he has extensive training and experience in each of the jobs. Now, lets look briefly at the duties of a working camera crew:

a. Director. As with all large groups there must be one central person who is in charge, in a motion picture production this person is the "director". He is in charge of the motion picture personnel, sound personnel, editorial personnel and laboratory personnel during the production of the film.

b. Director of photography. The director of photography, sometimes called the first cameraman, is responsible for the pictorial quality of the production. He also supervises the lighting of the set. The director of photography does not, as a rule, manipulate the control of the camera. That is the job of the assistant cameraman or camera operator.

c. Camera operator. The camera operator or assistant cameraman is responsible for the movements and settings of the camera. He receives instructions from the director of photography, operates the camera being used, checks that the film core is correct, and assures proper loading of the camera. As a cameraman, you, and you alone, are responsible for what comes out of your camera. In order to make sure the product is correct, it is necessary to check and double check each item before the camera rolls.

d. Assistant cameraman. On large productions there may be an assistant cameraman. His job is to assist the camera operator and may handle the follow-focus duties. Follow-focus is a technique where the cameras focus is changed while the camera is operating. You may have a scene where an actor must walk toward the camera from a long distance. This requires the camera focus to change. A good "follow-focus" assistant is a valued technician on any crew.

e. Soundman (mixer). If you are filming sound, you will have a soundman.

f. Grip. The grip is a general handyman on the set. He moves sets, scenery and props, makes general repairs, lays down camera tracks for trucking shots, and pushes the camera dolly during takes.

g. Gaffer. The gaffer is an electrician. He wires the set, provides power as necessary, and when required, brings in power generators.

5. Checklist of items to remember before, during, and after filming.

a. Prior to shooting:

- | | |
|---------------------------|---|
| (1) Preshooting inventory | Check to make sure everything needed is available for the production. |
| (2) Setting up | Secure camera, adjust lenses, work controls, clean camera aperture and lenses. |
| (3) Film scratch test | Run a short piece of film to assure there are no scratches (also called a slop test). |

b. During shooting:

- | | |
|-------------------------|---|
| (1) Focus measurement | A tape measure is used to get an exact measurement. |
| (2) Lens aperture stops | Verify that f/stop is correct on every scene. |
| (3) Shutter | Correct shutter speed and degree shutter opening (DSO) must be verified on every scene. |
| (4) Tachometer | Check the tachometer for correct film speed while filming each scene. |

(5) Filters

Verify that the correct filters and filter factors are being used.

(6) Film jams

If a film jam occurs, make every effort to correct it on camera. If this is impossible, take the camera to the loading room and save as much film as possible.

c. End of shooting day:

(1) Disassemble equipment

This includes a thorough cleaning of aperture, film chamber, lenses, and magazines.

(2) Store equipment

In proper cases, boxes, or cartons.

(3) Secure equipment

This includes both physical security of equipment (camera equipment is a favorite target of thieves) and placing equipment so that it will not fall or otherwise unintentionally cause harm.

Lesson 1
PRACTICE EXERCISE

1. Which type of controlled action film or videotape does the recruiting command use?
 - a. Soldier common task orientation films
 - b. Historical film productions or videotapes
 - c. Joint optical interservice network productions
 - d. Documentaries that show recruits what the Army was like in WWII, Korea, and Vietnam
2. What are the lengths of controlled action films?
 - a. 5 to 10 minutes
 - b. 3 minutes to 1 hour
 - c. 1 minute to 5 minutes
 - d. 30 seconds to 1 minute
3. There are five basic elements of story construction. Introduction, buildup, and ending are three of them. What are the other two elements?
 - a. Mood and location
 - b. Music and sound effects
 - c. Central theme and climax
 - d. Dialogue and action
4. What are the minimum number of technicians needed for a military controlled action production?
 - a. 25
 - b. 15
 - c. 6
 - d. 2
5. What must you always be prepared for when filming or taping a controlled action production?
 - a. Climatic extremes in the weather
 - b. Long delays due to transportation foul-ups
 - c. Interference from local unions or guilds
 - d. All of the above
6. You are told to shoot a master shot. What would you do?
 - a. Film a set series of LSs, MSs, and CUs
 - b. Film a continuous shot of an entire sequence
 - c. Shoot a series of reverse angles and long shots
 - d. Shoot CUs, LSs, and cutaways

7. What is the one thing a camera operator can do in a controlled action film that cannot be done in an uncontrolled action film?

- a. Shoot special effects footage
- b. Shoot as many retakes as needed
- c. Shoot sound on film in a 70mm camera
- d. Shoot cut-ins, cutaways, and re-establishing shots

8. Who writes in the scene numbers and type of shot to be used in the script's left margin?

- a. The chief cinematographer
- b. The director
- c. The author
- d. The cameraman

LESSON 2
FILMING TECHNIQUES

TASK

Filming controlled action.

CONDITIONS

Given information and diagrams relating to filming controlled action.

STANDARDS

Demonstrate competency of the task skill and knowledge by correctly responding to 80 percent of the multiple-choice questions covering filming techniques for controlled action photography.

FM 11-82

Learning Event 1:
USE BASIC SEQUENCE

1. The foundation of good camera technique is referred to as the "basic sequence." This applies to both film and TV cameras. A basic sequence is a set of simple points used by professionals to achieve good footage. If you want to tell a story, you must put together a wide variety of shots to obtain a smooth, meaningful, visual flow of action. The basic sequence is the most important of all the camera techniques that you will learn in your motion picture or television course. In short, you must understand your medium as well as your camera; you must know pictorial continuity. Pictorial continuity is the framework of every well-constructed motion picture, whether it is a Hollywood epic, newsreel, documentary, or service training film.

2. Continuity in cinematography.

a. The main goal of a cinematographer is to present the scenes he films in such a manner that they convey a complete idea to the viewer. To accomplish this requires considerable thought and planning. Individual scenes, each presenting an idea or part of an idea, must be arranged in logical sequence. Related scenes should flow one into another so that there will be no gap in continuity. Unrelated scenes must be joined into the film with

smooth transitions so that they are accepted by the viewer as part of the story continuity. A well-filmed sequence, like a good story, starts with an interest-exciting introduction, progresses smoothly through its story, builds up to a climax, and reaches a reasonable conclusion.

b. As a motion picture or television cameraman, you will contribute the most vital element to a film production. You will supply the footage of the action and also film the footage needed for transitions that allow the editor to maintain continuity. You will work from a script when shooting controlled action, and you will furnish the scenes called for.

3. Basic sequence.

a. Every motion picture or television story is made up of one or more sequences. A sequence is a series of related scenes photographed with the long shot, medium shot, and close-up technique. Each sequence is a complete story within itself.

b. In recording activity, the need for sequences becomes even more apparent. It is important that sequences be photographed with the idea that they will portray a completely understandable story when they are put together and projected on the screen. In other words, the story must be developed in the long shot, medium shot, and closeup, and not be left to the imagination of your audience.

(1) A good cinematographer will employ the three basic sequence shots of scenes, the long shot (LS), medium shot (MS), and close-up (CU). Let's examine the long shot first. As the name implies, this is a shot taken at some distance from the subject. In the case of a man standing, it would most likely be a full-figure shot and would probably include some sky and foreground area. Second, the medium shot of the same person would probably cover from the top of his head to just below his waist line. Third, the closeup would most likely be of the person's head and shoulders.

(2) In many cases the three basic sequence shots are expanded to include the extreme long shot (ELS) and the extreme-closeup (ECU). An extreme long shot of a standing person might show him as being quite small in relation to the rest of the picture. As an example, you can visualize an extreme long shot of a boat on the shore of a lake with a small figure of a man approaching it. The LS, MS, and CU show him getting in the boat, sitting down, and preparing to start the motor. Then an extreme closeup of his hands on the starter.

(3) When shooting the basic sequence, you should bear in mind that the size of the subject in relation to the full picture area is purely relative. The camera-to-subject distance will vary for any particular long shot, depending on the size of

the original subject being photographed. For example, the distance required for a long shot of a hummingbird would be an extreme closeup of a man's face. The main point to remember is that the size of the subject, in relation to the area it occupies on the screen, determines whether it is a long shot, medium shot, or closeup. You may find it hard to differentiate between these shots. Where does a long shot end before it becomes a medium shot? There is no hard-and-fast rule governing it. Your own good judgement and opinion is the only answer.

c. A typical example of events in their logical sequence might be to place a camera in the position of a soldier when he walks into an orderly room to pick up his leave papers. His first impression is a broad general view of the room and the people in it; this is the long shot. Next, he walks closer to the first sergeant who is talking to the company clerk. The soldier approaches the group and the usual greetings are exchanged. That is your medium shot. Finally, the soldier walks up close to the first sergeant to pick up his leave papers and directs his conversation exclusively to him. At this point you see only the first sergeant's head and shoulders. Now you have your closeup. If this series of events were to be filmed, the camera lens would take the place of the soldier's eyes and normally would record the same sequence of events.

(1) To impress this concept firmly in your mind, let us repeat the entire sequence once more, only this time see Figure 2-1 as a guide.

Figure 2-1. The three basic shots

(1) continued)

You can see that this scene shows a soldier field-stripping a rifle. This is basically what the long shot shows--the man is leaning over the table with the rifle parts spread out. If you are interested in this action, you would move in for a closer look, and, as you approach, at one point you would get an intermediate view of the action which is pictorially represented by the medium shot. Then when you finally arrive at the scene of the action, you see it represented by the close-up. Each shot shows the action in more detail until, in the close-up, you can

see every bit of the action. In Figure 2-1, this would be the soldier taking the weapon apart under the guidance of his squad leader.

(2) The shot breakdown, long shot, medium shot, and close-up are transitions intended to take the viewer from a distant point to the place where the action is taking place and to do it in reasonable, believable steps. There are other means of accomplishing this and they will be mentioned later.

(3) At this point you may be wondering if changes to the LS, MS, and CU sequences can be made. Can you start with the CU? Yes, you can. After you have gained some experience, you might try such a technique.

(a) To illustrate, say you are shooting a training sequence for the military police. The first shot in the sequence might show a closeup of a gun lying on the floor. Then the camera might back up and a medium shot would show an over-turned lamp and table. Immediately the viewer assumes that some act of violence has occurred. Where has this taken place? Up to this point, until he sees the long shot, the viewer doesn't know. The LS establishes the fact that the action has taken place in, say, the library of an old home, and perhaps the police are just entering the room. Notice how the 1, 2, and 3 pattern (LS, MS, and CU) has changed to a 3, 2, 1 (CU, MS, LS) pattern. One word of caution: before you try this reversal technique, be sure you are familiar with the normal pattern. The reversal technique is generally used to obtain a special effect only; it should not be overdone.

(b) You may wonder if you can use a 3, 1, 2 order. The answer is that it generally produces an incoherent sequence and tends to confuse the audience. This is not to imply that it cannot be done. Almost anything can be done to the basic sequence, but any variation of technique is dependent on the story. Be sure there is a logical reason when you deviate from the normal pattern. Remember that in most cases, the audience wants to see the action as if they were actually there.

4. There is one approach to cinematography that you must consider at all times. Anytime you are taking motion pictures, you should feel that you are actually seeing for your audience. The simple fact is that if you don't shoot a scene, your audience won't see it. As soon as you stop shooting, your audience stops seeing; and if there are gaps in the continuity, your viewers cannot fill them simply by looking around. The audience will see only what is on the screen. In the above mentioned mystery story, the culprit may have left by an open window, but the viewer won't know this unless you show the window on film. If the open window is important to the story, you must show it. Otherwise, a vital part of the story will be lost. Rather than risk

forgetting the first important point in shooting successful motion pictures or television, let's briefly review the important reasons for including all three of the basic shots.

a. The long shot. This normally is the first shot of the sequence, and establishes the locality of the area the audience is viewing; hence this shot is sometimes called an establishing shot. It also gives the audience some background knowledge to prepare them for the scenes that follow. Without the long shot your audience may wonder where they are, and where the action is taking place. The locale must be set for every sequence, and the long shot is the technique used to accomplish this purpose.

b. The medium shot. While the long shot sets the scene, the medium shot introduces the action and the audience becomes aware of who, or what, the center of interest is. In addition, the medium shot allows for smooth transition from the long shot to the closeup. Remember in our earlier orderly room scene, the long shot showed the first sergeant and the company clerk. The MS then led the viewer's attention away from the room as a whole to a group of three people. The MS also provided a smooth transition to a closeup of the main actors. A smooth transition from LS to CU is most necessary. Can you imagine the confused faces of the audience if you went from a LS of the whole room to a CU of the first sergeant's face?

c. The close-up.

(1) The close-up takes the viewer right to the action. Everything is eliminated from the scene except the particular thing you are bringing to the viewer's attention. The CU can create a feeling of intimacy and warmth. The next time you are talking to someone, notice how you are constantly looking at their face and picking out various details. Certainly you don't back off about 20 feet while talking with them. The same principle applies when shooting your film.

(2) The close-up is the most important shot of a sequence. It shows detail of the action, thereby holding the interest of the audience. You might consider it the climax of the sequence, for just as a story has its introduction, build-up, and climax, each sequence has its LS, MS, and CU, with the CU being the most dramatic of them all.

(3) But there are other applications of the close-up. For instance, in training films, the close-up shows the viewer what he is supposed to learn. Through the close-up, the actual performance of a task can be demonstrated in such a way that the viewer has little difficulty understanding it, and complex operations can be made comparatively simple. Situations of this sort usually call for a series of close-ups, perhaps three or four. After that, it is necessary to re-establish the scene to remind the viewer of the action as a whole.

5. There is, in the art of cinematography, what is known as the Absolute Rule. This rule states, "Whenever the camera is stopped, change the angle and/or image size before you resume filming." Sometimes it is preferable to change both. This rule must be followed at all times when shooting action of any type. About the only time it is not used is when you are filming animation or inanimate objects.

a. With the filming of sequences comes the problem of visual retention versus close-ups. The average person viewing a film or tape on a screen will ordinarily retain only one or two scenes immediately preceding the scene being projected. With so much of the surroundings being eliminated in close-ups, the audience occasionally must be reoriented in relation to those surroundings. Close-ups without reorientation will tend to confuse, and may even completely "lose" the spectator; especially where several close-ups appear consecutively. This reorientation is accomplished by making what is generally termed the re-establishing shot. This will be explained in the next learning event.

b. When we speak of the extended sequence we mean the basic sequence, that is; long, medium, and close-up, with the addition of extreme long shots and extreme close-ups.

c. A final point to remember is that the entire sequence can be reversed. Start with a close-up and move back to the long shot.

6. Sequence development.

a. The basic sequence technique is the fundamental step in producing a good storytelling documentation. Remember that your job is to tell a story. The basic sequence breakdown, camera angles, and overlapping action all play an important part in maintaining continuity of the story. In a motion picture, continuity is the continuous and coherent flow of the action and story. If you shoot the proper amount of overlapping action, the transition from one scene to the next is unnoticeable, thus contributing to a smooth flow. All of these things play a large part in the production of a good documentary. However, this isn't the entire offering of a good story. Many other factors must still be considered.

b. Maintaining audience interest is the main consideration of a good motion picture or television story. The picture is a failure and is not doing the job it was designed to do if the interest of the audience is lacking. In the case of an instructional or research film, the result is more than just a loss in entertainment value. A new rifle can look good, it can be sturdily constructed, and it can have the latest features; but, if it won't shoot, it's like a movie that can't keep the audience interested -- it just is not doing the job it was designed to do.

Learning Event 2:

SHOOT RE-ESTABLISHING SHOTS (RS) AND CAMERA ANGLES

1. Re-establishing shots.

a. An audience usually has difficulty remembering more than one scene back. The experienced cameraman reorients his audience from time to time by furnishing scenes for this purpose. These scenes are called re-establishing shots (RS).

(1) A series of related shots make a sequence and sequences joined together make a story. Sequences should be joined together with an RS. This makes the story clear, unbroken, and results in a smooth flow of action.

(2) The RS usually is a medium or long shot. It often follows a close-up and is used to re-establish the general scene. In other words, it reminds the audience of where they are.

(3) The RS is used to tie sequences together and to keep the audience from getting confused or lost since it can rarely keep in mind more than one scene at a time. The RS will help keep audiences oriented, reminding audiences how a small scene fits into the larger scene that includes it.

b. Re-establish the scene when the subject is moved from an old to a new location. Use the RS to end a sequence.

(1) In the RS, the camera is moved back from the closeup position and a scene is made in which the spectators once again will see where the close-ups were taking place in relation to the surroundings. Usually a medium or medium-close shot will serve very well for re-establishing, after which it is perfectly permissible to move in again for more close-ups. Not only does the RS keep the audience oriented at all times, but it lends variety in camera positions, which is always a desirable factor.

(2) Instead of ending a sequence with a closeup, use an RS. This leaves the spectator with the satisfied feeling that he has seen all the important details as the sequence ends, and is not left "hanging in midair" on a close-up while expecting a continuation of the action.

(3) Re-establishing is also used to tie two sequences together.

(a) one way of accomplishing this is to re-establish at the end of one sequence and have the person walk out of the scene. Now, by showing the person entering in the establishing scene of the second sequence, a definite relationship has been achieved between the two separate actions even though there may be some distance between the locations of the two sequences; the audience accepting the fact that the story has continued uninterrupted up to this point. This technique is called "moving out and in the frame."

(b) Another technique of tying two sequences together is to make a re-establishing shot, then pan with the person as they move from the location of the first sequence. By using the pan shot as the opening scene of the second sequence, and continuing the second sequence with medium and closeup shots, the two sequences are tied together.

c. Where two sequences take place near each other, a reestablishing shot can be made in which both locations can be seen. When sequence number 1 is finished, move the camera back to include the location of both number 1 and 2, thus establishing the second location in relation to the first location. The camera can then be moved in for the story taking place at location number 2. This conveys to the spectator the exact distance between the two locations.

2. Methods of re-establishing.

a. Re-establishing a scene. There are three methods of re-establishing a scene.

(1) The first is by pulling back; we pull or move the camera back away from the subject. In other words, we go from a closeup to a medium or long shot. We could possibly go from a medium to a long shot.

(2) The second method is pulling back and panning. This method is used to follow a subject from one location to another. This is normally used for covering short distances only.

(3) The third method is shooting a reverse angle. This is done by turning the camera around 180 degrees from the preceeding shot. It is usually used to show a subject changing location over a great distance.

b. Re-establishing action. Transitional devices are sometimes used to re-establish action. These devices are: gesture or implication; in and out of frame; clean exit and entry; and optical effects.

(1) The gesture or implication is used to show that something is about to happen and the audience knows by the gesture or implication what is going to happen next.

(2) Several in and out of frame scenes with clean exits and entries will carry the subject to a very long distance.

(3) Clean exit and entrance used once will carry a subject to a nearby location.

c. Optical effects are mechanical methods done in the laboratory to re-establish action and make transitions between sequences. The most common opticals are fade-in and fade-out, wipes, dissolves, and swish pans. The swish pan is a panning shot in which the camera moves so fast that the action is blurred and unrecognizable. These effects can be made with a television editing system when shooting TV tape.

3. These techniques are all part of filming a production. That is, you control all the action. You must first understand what makes a good film. Once you have mastered the techniques, then you will find it rather simple to make good films or tapes.

4. Using camera angles and techniques. By combining three different techniques--changing camera angles, varying subject distance, and changing camera height--you reach the ultimate in getting the most interest and variation from the basic sequence. This is not to say that you must use all the variations at all times. Each separate scene will vary as to shooting possibilities, and it is impossible to make definite rules, or if they were made, they would be impossible to follow. Rely on your judgement, and eventually your experience, to make decisions on camera angles and techniques.

a. Camera angles. Although the subject of camera angles is different from that of the basic sequence breakdown, the two are very closely tied together. Look again at Figure 2-1 and examine the soldier field-stripping a rifle. If these three scenes had been shot a little differently, the quality of the sequence could have been greatly improved. A simple way to build interest at this point is to change the camera angle between each of the scenes. When you bring the camera closer for each scene, change its angle at the same time, as shown in Figure 2-2.

(1) Very often mechanical features of the terrain force you to make a change in your camera angle. Using Figure 2-1 as an example, it is possible that an object such as a cabinet might be in the way, causing you to shoot from the rear of the table instead of the side.

(2) When changing camera angles, be careful that you do not suddenly reverse or change the camera position to an excessive degree between any two scenes. If the reversal or change is too abrupt, the scene may look as if an entirely different subject is used. By the time viewers realize what has happened, they may have lost the plot. A good rule to follow is never change angles more than 45 degrees between shots.

Figure 2-2. Angle and distance variation

(3) By regulating the angle at which the action passes across the axis of the lens, angle shots can serve to speed up or slow down action. Objects moving at right angles to the axis of the lens appear to be the fastest, while objects approaching the lens directly, or going straight away from it, are the slowest. Any degree of apparent speed can be obtained by selecting some angle between these two extremes.

b. Varying subject distance. It should be apparent there is a definite improvement in the sequence when you change not only the camera angle but also the subject distance. If you merely change distance, the only variation between the scenes of the sequence is the change of subject size. Moreover, slight differences in action will be more noticeable on the screen and a change of camera angle will minimize this. Another advantage of changing the camera angle is that it provides variety in your scenes and makes the overall production much more interesting.

c. Changing camera height. While you are changing the angle between scenes during the basic sequence breakdown, another variation possibility exists--you can also vary the height of the camera. For example, both the LS and MS are shot at eye level, and then, when you are coming in for the CU, you lower the camera to almost ground level. Any type of variation would be suitable here, depending on the circumstances of the sequence and the mood you are trying to convey.

(1) You will find that a low camera angle tends to make the subject higher and seem more important, while a high viewpoint tends to reduce both the size and apparent importance of the subject. Here again, a too-abrupt change of angle can cause audience confusion. Unless you are after a special effect, 45 degrees should be the maximum.

(2) The mood of a scene and its psychological effect on an audience can be molded by a proper choice of angle. For example, in some of the horror movies you have seen, the villain is usually shot from a low angle to make him seem huge and menacing, while the heroine would be seen from a high angle to emphasize her helplessness. The scene now gives you the feeling that the villain is all powerful and cannot be overcome. But when our hero comes to the rescue, he is given the low angle treatment making him the strong personality.

d. One very important point to remember when using angle shots is to be careful that your angles are not obvious. Your audience should be aware only of the action and the mental impression being conveyed. If they admire the terrific angles in your sequence, the main objective--telling the story--is lost. In the various camera angles that carry a sequence of scenes from a long shot to a closeup, each shot must match the other so closely that anyone viewing the picture on the screen will feel as though he had actually stepped closer to the person or object shown.

Learning Event 3:
USE CUT-INS AND CUTAWAYS

1. Accepting the premise that the motion picture or television audience has difficulty in recalling more than one scene immediately preceding that which is currently being screened (a fact which the reader may personally check) the cameraman may insert a special scene (or even entire sequences), between two scenes which otherwise, following in rapid succession, would interrupt story continuity. These scenes of slight, yet important, differences intended to divert audience attention are classified as either "cut-ins" or "cutaways".

2. Cut-ins.

a. A technique for maintaining continuity and bridging gaps in action is that of shooting a cut-in. As the name implies, the cut-in cuts into the action taking place and is usually a closeup or extreme close-up. In a sequence showing two people meeting, a close-up of their handshake is a cut-in. If your subject is packing for a vacation, and you wish to show how well-traveled he is, an extreme closeup of hotel labels on his bag constitutes a cut-in.

(1) For another illustration; suppose you are filming an Armed Forces radio and TV public service announcement that uses a golf game as the theme. The highlights of the action in a golf game are the drives, the various approach shots, and, of course, the putts. Then, walking is part of the game, but it would be ridiculous to try to show it all because you and the audience would be bored. Here's where the cut-in technique can make an interesting sequence out of one that would otherwise be unbearable. Your cut-in could be the shot shown in Figure 2-3.

(2) The next scene of the series most likely would be another long shot showing a continuation of the action. The golfer might approach the ball, stop, and sight the cup before making his putt. Another variation of the same technique could be a cut-in filmed in slow motion of the club hitting the ball. Or, you could use a closeup of the golfer's grip on the handle of the club. Any number of variations of the cut-in are possible.

b. Use your imagination, but do not overdo a good effect. Remember, a cut-in does just that, it cuts into the action and must have been established in the previous scene.

Figure 2-3. The cut-in

3. Cutaways.

a. An opposite, but also effective, technique from the cut-in is the cutaway. In a cutaway, the camera is directed away from the main action to show some parallel action that is taking place at the same time. For example, while filming a troop review, a shot of the audience is a cutaway. It is related to the main action, and although not part of it, it is a part of the story and must be shown. The cutaway smooths out the continuity by bridging gaps and is used to cover up major jumps in action.

b. The cutaway is also used to build atmosphere and stimulate the interest or the imagination of the audience. For instance, while filming a sequence in a training film about missile launching, cutaways of the block house and the strained faces of the engineers might transmit the feeling of excitement to the audience.

c. During a long story, the cutaway also helps to reorient the audience in essential parts of the plot that are not being shown at the moment. A cutaway of action taking place at widely separated locations can be included even though the scene shifts from one area to another if the transition is smooth and acceptable. A simple illustration of the effective use of the cutaway is shown in Figure 2-4. Variety and interest in a golf game are increased by a cutaway to the caddy showing him removing the flag from the cup.

Figure 2-4. The cutaway

4. Requirements and limitations of cut-in and cutaway scenes.

a. In order for scenes to be considered suitable for use as cut-ins or cutaways, they must meet certain requirements. These limitations are three-fold:

(1) The scenes must change audience attention from what otherwise would be a loss of continuity in order to prevent audience distraction. Losses of continuity can be prevented by footage which includes jumps in action, changes of screen direction, or allowance for time passage.

(2) The scenes must be part of the immediate action (a cut-in) or pertain to the story (a cutaway). Footage which does not contribute to the story is not suitable for use. Rather than aid in keeping the audience oriented to what is occurring, such footage would only serve to confuse the viewers and contribute to the loss of continuity.

(a) If the cut-in or cutaway is to be useful in maintaining audience orientation, it must be clearly established in the audience's mind. The two methods by which this may be accomplished are by either visual awareness on the part of the audience or by suggestion resulting from reasoning or expectation of the audience. For example, a long shot of the grounds where a training film fire sequence was taking place, would show some spectators who would normally be expected at the site of a catastrophe. Later, close-up scenes of one or more of these bystanders could be used as cutaways.

(b) The audience had previously been made aware of onlookers by actually seeing them (visual awareness).

(c) The cameraman could then film close-ups of any "extras" (actors) as cutaways, providing they had concerned looks on their faces.

5. Because a cut-in must have been clearly brought to the attention of the audience, as well as having appeared in the immediately preceding scene, the cameraman cannot be satisfied with merely having the cut-in material included in the first scene. The camera angle, image size, and action must be such that where the cut-in is screened, the audience will immediately recognize and understand it. Being part of the immediate action and having been included in the preceding scene, the cut-in is usually a medium shot or close-up.

6. Cutaways, not part of the immediate action, but pertaining to the story, do not necessarily appear in the preceding scene, but must have been established, either visually or by suggestion at any earlier point in the story. Therefore, a cutaway may be anything from an extreme long shot to an extreme close-up.

Learning Event 4:

MAINTAIN SCREEN DIRECTION

1. What screen direction is.

a. In motion pictures, your subject spends considerable time moving about. When the subject is seen on the screen going from one place to another, the direction it takes is known as screen direction. It seems obvious that once your subject establishes the direction he is going to take, the audience should see him move in that direction until there is some logical reason for him going in another direction. The audience should then be made aware that the subject is changing direction.

b. To illustrate, suppose you are making a training film that starts with a parade and your camera is set up as shown in Figure 2-5. The troops are moving from left to right in front of your camera and will move from left to right across the screen. If you cross the street and pick up the same subjects (fig 2-6), you reverse their screen direction. Even though the parade is still going in the same direction down the street, it is crossing in front of the camera from right to left, and will take that same screen direction. To the viewer, it will look as though the parade is returning to its starting point. He may be completely confused. Thus, you owe it to your viewer to keep him oriented.

2. Maintaining screen direction.

a. It is not difficult to maintain screen direction when you are shooting controlled action that behaves in a predictable manner. A simple method for establishing and maintaining screen direction is to use an imaginary line drawn through the direction of travel. In the case of the parade (fig 2-7), the imaginary line is from the rear through the front of the car, or, left to right. If all your shooting is done from the same side of the imaginary line there is no problem. All your shots will have left to right screen direction.

b. Sometimes it is necessary to take up a camera position on the opposite side of the action. And sometimes it is necessary to have your subject change direction. In either case, you must let your audience know that the change is taking place. Some of the ways that you can show or mask changes in screen direction are:

Figure 2-5. Screen direction

Figure 2-6. Screen direction reversed

Figure 2-7. The imaginary line

(1) Have your subject actually change direction and show the change on the screen. If you film a sequence showing a sentry walking his post, show him moving in one direction; then pick him up as he is doing an about face and show him moving in the opposite direction.

(2) Gradually film around your subject and include a neutral shot. In the parade scene mentioned previously, if you film from the other side of the street you could have worked around the vehicle. This of course will change screen direction. Before crossing the street you would have to move out in front for a "head-on" shot, or behind for a "tail away" shot, either shot is neutral in direction. Now you can pick up the action from the opposite side of the street. The screen direction is reversed, but the audience knows how it came about. Remember not to change your angle too abruptly or it will cause a shock to the audience. Gradually working around the subject is the key to this technique.

(3) Introduce a scene (cutaway) to divert your audience. The attention of the audience can be diverted from the screen direction of the subject by the use of a cutaway. Again using our parade scene as an example, to conceal the change in screen direction, a cutaway shot of a person watching the parade will serve to divert the audience awareness in the change of screen direction. It is always better to use two or more cutaway scenes in a diversion situation, thereby utilizing the audience's inability to remember more than two scenes back.

(4) Use of a prominent object to orient the audience to the movement of your subject. Use a reference point that the

audience can recognize, as, for example, our subjects in the parade marching toward a prominent statue. One cameraman filmed the scene from one side and another cameraman filmed the action from the other side. These two scenes edited together would have contrasting screen direction. By seeing the statue in both scenes the audience will accept the fact that the subject is still going in the same direction.

3. Contrasting screen direction. Abrupt changes in screen direction are sometimes used to create special effects.

a. For example, scene 1 is a sports car speeding from left to right across the screen. Scene 2 is a fast passenger train crossing the screen from right to left. Scene 3 cuts back to the car, and scene 4 shows the train again. The audience begins to realize the car and the train are coming together and a crash is imminent. But, the car's direction must remain from left to right, and the direction of the train must remain from right to left. The whole effect will be lost should the car or train change direction. Contrasting screen direction creates suspense.

b. In travel sequences, be map conscious. If you have a plane, car, or person going from New York to California, they should move from right to left on the screen, as you would picture it on a map. Conversely, if a person, boat, or plane is going from New York to England, the object should move from left to right on the screen; again as you would picture it on a map. This is known as map direction.

4. Dynamic screen direction is shown as moving bodies either from left to right or right to left, while neutral screen direction is moving away from or towards the camera. A static direction is that of a body at rest. Remember that even the static body must show screen direction. Remember also the imaginary line. Crossing improperly will change screen direction and cause confusion. Finally, clean entrances and exits are important when introducing or eliminating different elements, whenever a series of moving shots are filmed against different backgrounds, or when a subject moves from one room to another.

5. You can now establish a few rules to help maintain screen direction.

a. Remember the direction in which your subject is moving at the end of a scene. Maintain that direction in the following scene. Use the imaginary line.

b. Show the subject making changes in direction, whenever possible.

c. Visually explain the change to your audience so they can maintain continuity.

Lesson 2
PRACTICE EXERCISE

1. What is included in an extended sequence that is NOT in the basic sequence?
 - a. Long shot
 - b. Close-up
 - c. Re-establishing shot
 - d. Extreme close-up
2. What is the foundation of good camera technique?
 - a. Shoot everything
 - b. Basic sequence
 - c. Different angles
 - d. Various shooting speeds
3. Which is the main goal of a cinematographer?
 - a. Cover scenes
 - b. Expose total film
 - c. Shoot basic sequences
 - d. Convey a complete idea
4. Which shot is used to re-orient the audience?
 - a. Change in angle
 - b. Extreme close-ups
 - c. Cut-ins or cutaway
 - d. Re-establishing shots
5. You want to show a person as powerful and tall. Which technique will you use?
 - a. Close-up
 - b. Medium shots
 - c. Shoot from the left
 - d. Shoot from a low angle
6. In the final analysis of a motion picture, what is the main consideration?
 - a. Good exposure
 - b. Complete basic sequence
 - c. Maintaining audience interest
 - d. Total use of cut-ins and cutaways

7. You want to divert the audience's attention. Which technique will you use?
 - a. Distractive scenes
 - b. Cut-ins or cutaways
 - c. Extreme long shots
 - d. Extreme close-ups
8. What is one purpose of the cutaway?
 - a. Show specific action
 - b. Cover major jumps in action
 - c. Complete a basic sequence
 - d. Maintain screen direction
9. How can you show or mask changes in screen direction?
 - a. Film around your subject
 - b. Shoot an extreme long shot
 - c. Shoot an extreme close-up
 - d. Shoot a reverse angle
10. You want to show an imminent disaster. Which filming technique can you use?
 - a. Rapid basic sequence
 - b. A series of cut-ins
 - c. Long shots and close-ups
 - d. Contrasting screen direction
11. When should you use contrasting screen direction?
 - a. To show distraction
 - b. To cover jumps in action
 - c. To create suspense
 - d. Confuse the audience

APPLICATION OF TV TEST EQUIPMENT

SUBCOURSE NO. SS0602-6

(Developmental Date: 30 Sep 86)

U.S. ARMY SIGNAL CENTER
Fort Gordon, Georgia

Six Credit Hours

GENERAL

The Application of TV Test Equipment block is a major part of the Radio/Television System Specialist, MOS 26T Skill Level 1 course. This subcourse is designed to teach the knowledge necessary to perform tasks related to maintenance and repair of television system equipment. Information is provided on several tasks which are performed at increasing levels of difficulty at Skill Levels 1 and 2. The subcourse is presented in three lessons, each lesson corresponding to a terminal objective as indicated below. This subcourse will assist personnel in MOS 41E to merge into MOS 26T30 as prescribed by AR 611-201.

Lesson 1: APPLICATION OF TEST METERS

TASK: Describe and identify theory and terminology used in the application of test meters.

CONDITIONS: Given the information and illustrations about terms and theory relating to application of volt/ohmmeter for TV maintenance.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of the application of test meters.

Lesson 2: DEFINE THE THEORY AND APPLICATION OF AN OSCILLOSCOPE

TASK: Describe the theory and terminology related to maintenance procedures for the oscilloscope.

CONDITIONS: Given the information and illustrations about terms and theory relating to application of the oscilloscope.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of using an oscilloscope.

Lesson 3: DESCRIBE THE APPLICATION OF GRATING GENERATOR, DOT BAR GENERATOR, AND VIDEO SWEEP MARKER GENERATOR

TASK: Describe the theory and terminology of maintenance with the application of video sweep marker generator, grating generator, and dot bar generator.

CONDITIONS: Given information and illustrations about terms and theory relating to the application of video sweep generator, grating generator and dot bar generator.

STANDARDS: Demonstrate competency of the task skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of the application of video sweep marker generator, grating generator, and dot bar generator.

This subcourse supports the following MOS 26T tasks:

113-575-0021	Troubleshoot and Repair a Television Receiver
113-575-0038	Troubleshoot and Repair Video Pulse Distribution Amplifier
113-575-0040	Troubleshoot and Repair a Sync Generator
113-575-0041	Troubleshoot and Repair a Character Generator
113-575-0042	Troubleshoot a Reel-to-reel Audio Tape Recorder/Reproducer
113-575-0043	Troubleshoot a Color Television (TV) Camera
113-575-0044	Troubleshoot a 3/4-inch Video Cassette Recorder/Reproducer (VCR)
113-575-0045	Troubleshoot a Television Transmitter
113-575-0046	Troubleshoot a Television (TV) Video Switcher
113-575-0049	Troubleshoot a Time Base Corrector
113-575-2040	Perform Functional Check of a Color Television (TV) Film Chain Camera
113-575-2041	Perform Functional Check of a Color Television (TV) Camera System
113-575-2042	Perform Functional Check of a Color Television (TV) Studio Camera Colorplexer
113-575-2043	Perform Functional Check of a Color Television (TV) Studio Camera
113-575-2044	Perform Functional Check of a Small Format Television (TV) Recording System, Using a 3/4-inch Video Cassette Recorder/Reproducer (VCR)
113-575-2045	Perform Functional Check of a Time Base Corrector (TBC)
113-575-2047	Perform Functional Check of a Television (TV) Transmitter
113-575-3029	Perform Daily Maintenance on a 3/4-inch Video Cassette Recorder/Reproducer (VCR)
113-575-3031	Perform a Complete Color Convergence of a Color Television (TV) Receiver
113-575-3033	Perform Measurement of the Visual and Audio Transmitter Carrier Frequency

113-575-3035	Perform Daily Maintenance of a Television (TV) Video Switcher
113-575-3036	Perform Preventive Maintenance of a Character Generator
113-575-4010	Replace a Color Picture Tube (CRT)
113-575-4011	Replace Faulty Television (TV) Studio Camera Cable
113-575-4012	Replace RF Transmission Lines Between Antenna and RF Modulators
113-575-8017	Perform Alignment Check of a Wave Form Monitor

INTRODUCTION TO APPLICATION OF TV TEST EQUIPMENT

The complexity of today's electronic technology requires that a technician become as knowledgeable and experienced in as many facets of his/her career field as possible. The purpose of this subcourse is to provide the technician, MOS 26T soldier, with an overall view of some of the test equipment used in this field with some guidelines on how to use it to troubleshoot any equipment, including what to look for, how to check it out, and a few procedures to be followed. It is also meant to assist MOS 41E personnel to merge into MOS 26T30, as prescribed by AR 611-201, and to help anyone cross-train into the 26T career field.

LESSON 1
APPLICATION OF TEST METERS

TASK

Describe and identify theory and terminology used in the application of test meters.

CONDITIONS

Given the information and illustration about terms and theory relating to application of volt/ohmmeter for TV maintenance.

STANDARDS

Demonstrate competency of the task, skills and knowledge by correctly responding to 80 percent of the multiple-choice test covering theory and terminology of the application of test meters.

None

Learning Event 1:

DETERMINE WHAT A MEASURING INSTRUMENT IS

1. Measuring Instruments. The primary measuring instrument that you use in performing maintenance tasks are the ammeter, the voltmeter, and the ohmmeter. These three instruments are basically current measuring devices. The main difference in construction is that an external resistance is connected with respect to the moving element in different ways.

2. Ammeter. The electrical instrument used to measure the current in an electrical circuit is called an ammeter. It is connected to measure the current passing a given point. Figure 11b illustrates how you connect an ammeter into the circuit to measure the current passing point P of Figure 1-1a. When you connect an ammeter between the source and the load shown in Figure 11b, it is in a series.

A. SERIES CIRCUIT WITHOUT AMMETER

B. AMMETER CONNECTED IN SERIES

Figure 1-1. Connection of an ammeter in a circuit

a. You must observe polarity when connecting an ammeter into an electrical circuit. To do this properly, you must trace electron flow from the negative (-) side of the battery through the circuit and back to the positive (+) side of the battery.

b. Then break the circuit and connect the ammeter so that electrons enter the negative side and exit through the positive side into the load (fig. 1-1b).

c. An ammeter that measures smaller amounts of current is called either a milliammeter or a microammeter, depending upon the amounts of current to be measured.

3. Voltmeter. The electrical instrument used to measure difference of potential, or voltage, is a voltmeter. It is connected so it measures the difference of potential between two points. Figure 1-2b illustrates the proper connection of a voltmeter.

a. To measure the electromotive force of the battery, you must connect voltmeter V1 (fig 1-2b), while observing polarity. To measure the potential difference between points X and Y of the circuit (fig 1-2a), it is necessary to trace the electron flow and observe the polarity between points X and Y.

b. Note that the side of the resistor that the electrons enter is the negative side. A meter that is connected across a difference of potential (fig 1-2b), is in parallel.

A. SERIES CIRCUIT WITHOUT VOLTMETER

B. VOLTMETER CONNECTED IN PARALLEL

Figure 1-2. Connection of a voltmeter in a circuit

4. Ohmmeter. An electrical instrument which is used to measure resistance is an ohmmeter. Figure 1-3b illustrates the connection of an ohmmeter to measure resistance.

A. RESISTOR CONNECTED IN SERIES CIRCUIT

**B. MEASURING THE RESISTANCE OF THE RESISTOR
RESISTOR WITH AN OHMMETER**

Figure 1-3. Connection of a ohmmeter in a circuit

a. In order to measure the resistance of resistor XY in Figure 1-3a, the resistor XY must be disconnected from the remainder of the circuit.

b. Then the ohmmeter is placed across the resistor as shown in Figure 1-3b.

5. For convenience, more than one electrical measuring device may be combined in one instrument. An instrument of this type is variously called a multimeter, a multitester, a voltohmmeter, etc. The term meter is frequently used in scientific literature and may designate any of the above.

NOTE: The combination meter will be discussed later in this section.

6. Meter Circuitry. You may recall that you connect ammeters in series in that part of the circuit where the current is to be measured. The voltmeter must be connected in parallel with the component between the two points where a potential difference is to be measured. The ohmmeter must not be connected into a hot (power-source-applied) circuit.

a. Ammeter. If you connect a 0-to 10-milliampere meter coil in a circuit carrying 10 amperes, not only is the meter coil incapable of measuring such large values of current, but it will be severely damaged.

(1) To measure larger amounts of current than the coil itself can safely carry, you connect a resistance in parallel with the coil, as shown in Figure 1-4a. The current being measured divides between the coil and resistor, with a small portion flowing through the coil (R_m) and the remainder through the parallel resistor, called the meter shunt (R_s). The shunt may be built into the meter or it may be mounted externally.

Figure 1-4. Typical ammeter circuit

(2) Ammeters which are designed to measure several ranges of current use a shunt for each range. The shunts are mounted on a common terminal board and are connected to a multiple switch, as shown in Figure 1-4b. Setting the switch to the desired range connects the proper shunt into the meter circuit. Shunts usually contain only a fraction of an ohm of resistance and consist of a few inches of a metal alloy having a low temperature coefficient. The alloy is drawn into a wire and is wound around a piece of mica or fiber and mounted on a terminal board.

(3) The accuracy of an ammeter reading depends upon the relative magnitudes of the meter resistance and the circuit load resistance (resistance of the circuit into which the meter is connected). For example: if the meter resistance (R_x) equals the circuit load resistance (R_L), as shown in Figure 1-5a, the value of actual circuit current is twice that of the measured current, representing an error of 50 percent. If you decrease the meter resistance as shown in Figure 1-5b, you also decrease the percentage of error. If the meter resistance is considerably smaller than the load resistance, the percentage of error becomes so small that for practical measurements it can be disregarded. Thus, for any given circuit conditions, the accuracy of the ammeter reading is greater if the total meter resistance is much less than the ohmic resistance of the load.
